

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### **Usage guidelines**

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### **About Google Book Search**

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

## PREFACE

The present volume of the **NEW INTERNATIONAL YEAR BOOK**, the tenth in the series that began with the 1907 issue, runs to more than the usual length owing to the necessity of treating in adequate detail the Presidential Campaign and Election. Ten years' experience have presented no reason for modifying in essentials the plan of the **YEAR BOOK** and it continues to aim at comprehensive rather than specialized treatment and to preserve the alphabetical order of presentation as best suited to a general work of reference, designed for all classes of readers. The title list this year has been extended as a result of the more thorough developments of the cross reference system. Another improvement over previous issues is the expansion of the biographical department, which now includes a wider range and a more complete treatment of biographies pertaining to the year than can be found in any other single work. Aside from the Presidential Campaign the dominant article in the **YEAR BOOK** continues to be the review of the War in Europe, which, as in the two preceding issues, has been prepared by Professor Carlton Hayes. The relations of the United States to the War are discussed separately as before under the title, **UNITED STATES AND THE WAR**. The present number contains an unusually comprehensive discussion of economic and social topics such as **ARBITRATION AND CONCILIATION, BANKS, FINANCIAL REVIEW, LABOR, STRIKES AND LOCKOUTS, CHARITIES, COÖPERATION, WELFARE WORK, WORKINGMEN'S COMPENSATION, PENOLOGY, TAXATION, CHILD LABOR, PRICES**, etc. The unprecedented extent to which engineering skill has been applied to the work of destruction appears in such articles as **MILITARY PROGRESS, NAVAL PROGRESS, BATTLESHIPS, and SUBMARINES** in which the technical developments as regards *matériel* are related, and under **SHIPPING** are described and enumerated the losses inflicted on the merchant fleets of both Allied and neutral nations. The article **SHIPBUILDING** is of interest as showing the efforts made to make good these losses, while **CHEMISTRY, INDUSTRIAL** records what was being done to relieve disturbed manufacturing conditions and shortage of supply by improved processes and by new materials.

LIST OF CONTRIBUTORS

- AGRICULTURE, BOTANY, FOOD, FORESTRY, HORTICULTURE, IRRIGATION, ETC.  
EDWIN WEST ALLEN, PH.D.,  
UNITED STATES DEPARTMENT OF AGRICULTURE;  
ASSISTED BY EXPERTS IN THE DEPARTMENT OF AGRICULTURE,  
AND  
ALFRED CHARLES TRUE, PH.D.,  
UNITED STATES DEPARTMENT OF AGRICULTURE.
- ANTHROPOLOGY (WITH ETHNOLOGY)  
ROBERT T. LOWIE, PH.D.,  
AMERICAN MUSEUM OF NATURAL HISTORY,  
AND  
CLARK WISSLER, PH.D.,  
AMERICAN MUSEUM OF NATURAL HISTORY.
- ARCHAEOLOGY  
OLIVER SAMUEL TONKS, PH.D.,  
PROFESSOR OF ART, VASSAR COLLEGE.
- ARCHITECTURE  
C. MATLACK PRICE,  
FORMERLY EDITOR OF THE *Architectural Record*.
- ASTRONOMY; METEOROLOGY  
T. W. EDMONDSON, PH.D.,  
PROFESSOR OF MATHEMATICS, NEW YORK UNIVERSITY.
- CHEMISTRY (GENERAL)  
E. T. WHERRY, PH.D.,  
ASSISTANT CURATOR, DIVISION OF MINERALOGY AND PETROLOGY, UNITED STATES NATIONAL MUSEUM.
- CHEMISTRY (INDUSTRIAL); CELEBRATIONS; EXPOSITIONS  
MARCUS BENJAMIN, PH.D., SC.D., LL.D.,  
EDITOR FOR THE UNITED STATES NATIONAL MUSEUM.
- CIVIL ENGINEERING AND MANUFACTURING SUBJECTS; AERONAUTICS; ETC.  
HERBERT TREADWELL WADE.
- DRAMA (AMERICAN AND ENGLISH)  
CLAYTON HAMILTON, M.A.,  
DRAMATIC CRITIC OF THE *Bookman*.
- ECONOMIC, SOCIAL, AND POLITICAL SCIENCE SUBJECTS  
FRANK HAMILTON HANKINS, PH.D.,  
PROFESSOR OF POLITICAL AND SOCIAL SCIENCE, CLARK COLLEGE, AND ASSISTANT PROFESSOR OF SOCIOLOGY, CLARK UNIVERSITY.
- EDUCATION IN THE UNITED STATES; UNIVERSITIES AND COLLEGES  
MILO B. HILLEGAS, PH.D.,  
COMMISSIONER OF EDUCATION FOR VERMONT.
- ELECTRICAL ENGINEERING SUBJECTS; PHOTOGRAPHY  
REGINALD GORDON,  
ASSOCIATE EDITOR OF *Industrial Management*.
- EUGENICS  
ALVAN A. TENNEY, PH.D.,  
ASSISTANT PROFESSOR OF SOCIOLOGY, COLUMBIA UNIVERSITY.
- EXPLORATION; POLAR RESEARCH; ALASKA  
A. W. GREELY, PH.D.,  
MAJOR GENERAL, UNITED STATES ARMY; COMMANDER GREELY POLAR EXPEDITION.
- FEMINISM; WOMAN MOVEMENT AND WOMAN SUFFRAGE  
JULIET STUART POYNTZ, A.M.,  
DIRECTOR, DEPARTMENT OF EDUCATION FOR WOMEN WORKERS IN THE CLOTHING INDUSTRY.
- FOREIGN GAZETTEER  
EDWARD LATHROP ENGLE,  
AND  
ALLAN EVA ENGLE.
- FRENCH LITERATURE  
ALBERT SCHINZ, PH.D.,  
PROFESSOR OF FRENCH LITERATURE, SMITH COLLEGE.
- GEOLOGY; MINERALOGY  
DAVID HALE NEWLAND, A.B.,  
ASSISTANT STATE GEOLOGIST OF NEW YORK.
- GERMAN LITERATURE  
AMELIA VON ENDE,  
CONTRIBUTOR TO THE NEW YORK *Evening Post* AND THE *Nation*.

**INTERNATIONAL PEACE AND ARBITRATION**

CLINTON ROGERS WOODRUFF, LL.B.,  
SECRETARY OF THE NATIONAL MUNICIPAL  
LEAGUE AND OF THE MOHONK CONFERENCE;  
PRESIDENT OF THE BOARD OF PERSONAL REGIS-  
TRATION, PHILADELPHIA.

**ITALIAN LITERATURE**

ALBERT ARTHUR LIVINGSTON, PH.D.,  
ASSOCIATE PROFESSOR OF ITALIAN, COLUMBIA  
UNIVERSITY.

**JEWES AND JUDAISM**

MEYER WAXMAN, PH.D.,  
RABBI, ALBANY, N. Y.

**LIBRARY PROGRESS**

WILLIAM W. BISHOP, A.M.,  
LIBRARIAN, UNIVERSITY OF MICHIGAN.

**LITERATURE (ENGLISH AND AMERICAN)**

HORATIO S. KRANS, PH.D.,  
EDITORIAL STAFF, *Harper's Magazine*.

**LITERATURE (CONTINENTAL): SEE FRENCH LITERATURE; GERMAN LITERATURE; ETC.**

**MEDICAL SUBJECTS**

ALBERT WARREN FERRIS, A.M., M.D.,  
CONSULTING PHYSICIAN OF THE ITALIAN HOS-  
PITAL, NEW YORK, AND OF THE BINGHAMTON  
STATE HOSPITAL; FORMERLY PRESIDENT OF THE  
NEW YORK STATE COMMISSION IN LUNACY AND  
MEDICAL EXPERT TO THE STATE RESERVATION  
COMMISSION AT SARATOGA SPRINGS.

**MILITARY PROGRESS**

CORNELIUS DEWITT WILLCOX,  
LIEUTENANT COLONEL, U. S. A.; PROFESSOR OF  
MODERN LANGUAGES, U. S. MILITARY ACADEMY.

**MUSIC**

ALFRED REMY, M.A.,  
EXTENSION LECTURER, COLUMBIA UNIVERSITY,  
AND FORMERLY PROFESSOR OF HARMONY AND  
COUNTERPOINT, INTERNATIONAL CONSERVATORY,  
NEW YORK; EDITOR OF BAKER'S *Biographical  
Dictionary of Musicians*.

**NAVAL PROGRESS AND RELATED SUBJECTS**

LEWIS SAYRE VAN DUZER,  
CAPTAIN, U. S. N., RETIRED; WRITES ON NAVAL  
AND NAUTICAL SUBJECTS.

**PAINTING AND SCULPTURE**

GEORGE KRIEHN, PH.D.,  
EXTENSION LECTURER IN THE HISTORY OF ART,  
COLUMBIA UNIVERSITY; LECTURER WOMAN'S ART  
SCHOOL, COOPER UNION.

**PHILOLOGY (CLASSICAL)**

CHARLES KNAPP, PH.D.,  
PROFESSOR OF CLASSICAL PHILOLOGY, BARNARD  
COLLEGE, COLUMBIA UNIVERSITY.

**PSYCHOLOGY; PSYCHICAL RE-  
PHILOLOGY (MODERN)**

JOHN LAWRENCE GERIG, PH.D.,  
ASSOCIATE PROFESSOR OF CELTIC, COLUMBIA  
UNIVERSITY.

**PHILOSOPHY**

HARTLEY BURR ALEXANDER, PH.D.,  
PROFESSOR OF PHILOSOPHY, UNIVERSITY OF  
NEBRASKA.

**PHYSICS**

WILLIAM W. STIFLER, PH.D.,  
INSTRUCTOR IN PHYSICS, COLUMBIA UNIVER-  
SITY.

**SEARCH**

EDWARD BRADFORD TITCHENER, D.SC.,  
PH.D., LL.D. AND LITT.D.,  
SAGE PROFESSOR OF PSYCHOLOGY, GRADUATE  
SCHOOL OF CORNELL UNIVERSITY,  
AND  
HARRY PORTER WELD, PH.D.,  
ASSISTANT PROFESSOR OF PSYCHOLOGY, CORNELL  
UNIVERSITY.

**RAILWAYS**

WILLIAM E. HOOPER,  
ASSOCIATE EDITOR, *Railway Age Gazette*.

**RELIGIOUS DENOMINATIONS**

JOHN W. RUSSELL, M.A.,

**RUSSIAN LITERATURE**

FELIX VEXLER, A.M.,  
LIBRARIAN, SCHOOL OF PHILOSOPHY, COLUMBIA  
UNIVERSITY.

**SANITARY ENGINEERING AND MUNICIPAL SUBJECTS**

MOSES NELSON BAKER, PH.B., C.E.,  
EDITOR OF THE *Engineering News-Record*.

**SCANDINAVIAN LITERATURE**

HARRY V. E. PALMBLAD, A.M.,  
ASSISTANT PROFESSOR OF GERMANIC LANGUAGES  
AND LITERATURES, UNIVERSITY OF KANSAS.

**SPANISH LITERATURE**

JOHN DRISCOLL FITZ-GERALD, PH.D.,  
MEMBER OF THE HISPANIC SOCIETY OF AMER-  
ICA; CORRESPONDING MEMBER OF THE SPANISH  
ROYAL ACADEMY AND OF THE ROYAL ACADEMY  
OF HISTORY OF MADRID; PROFESSOR OF SPANISH,  
UNIVERSITY OF ILLINOIS.

**SPORTS**

CHARLES A. TAYLOR,  
MEMBER OF THE STAFF OF THE *New York Tri-  
bune*.

**WAR OF THE NATIONS**

CARLTON J. H. HAYES, PH.D.,  
ASSOCIATE PROFESSOR OF HISTORY, COLUMBIA  
UNIVERSITY.

**ZOOLOGY; FISH AND FISHERIES**

AARON L. TREADWELL, PH.D.,  
PROFESSOR OF BIOLOGY, VASSAR COLLEGE.

**NOTE:** CROSS references in **SMALL CAPITALS** indicate that the allusion is to a separate article; cross references in *italics* denote that the reference is to a subdivision of a main article. A cross reference in *italics*, standing alone in an article, carries the reference to another subdivision of the same article. The letters q. v. (*quod vide*—Latin “which see”) in parentheses following a word, indicate that the subject is treated under its own name elsewhere in the volume.

**NOTE:** In certain tables in this work it will be found, by addition, that the totals do not correspond to the sum of the items. This is the result of the omission or inclusion of certain small items which are not mentioned in the table, but are included in the totals. This is a usage frequently employed in the compilation of government statistics, from which sources the greater number of the tables in the **YEAR BOOK** are taken.

# THE NEW INTERNATIONAL YEAR BOOK

**A**BBE, CLEVELAND. An American meteorologist, "father of the United States Weather Bureau," died at Chevy Chase, near Washington, D. C., Oct. 28, 1916. He was born in New York City in 1838, graduated at the Free Academy (now College of the City of New York) in 1857, and afterward studied under distinguished astronomers at Ann Arbor, Mich., and at Cambridge, Mass., and resided at the Pulikova Observatory, Russia. After returning to the United States Dr. Abbe became director of the Cincinnati Observatory in 1868. For four of the five years that he held this post, he published daily weather forecasts, the first that had been given the public officially. The United States government soon afterward inaugurated a similar system, and called Dr. Abbe to prepare weather predictions and storm warnings, first as assistant to Gen. A. J. Myer, who had been chief signal officer of the army, and, from 1891, as meteorologist of the Weather Bureau. Under his direction were the published "probabilities" issued every three days, beginning in February, 1871; they gained for the anonymous author the name of "Old Probs." For many years Dr. Abbe edited the official *Monthly Weather Review*, and in 1909-13 he was also editor of the *Bulletin of the Mt. Weather Research Observatory*. In addition, he lectured at Johns Hopkins and was a professor at George Washington University. Among the honors that came to him were degrees of LL.D. from the University of Michigan and Glasgow University, membership in the National Academy of Sciences, and the Symons gold medal of the Royal Meteorological Society of Great Britain (1912). To Dr. Abbe is to be credited initiation of the movement for the adoption of systems of standard time and hourly meridians, and efforts that advanced the study of ocean meteorology, the prediction of river floods, the requirement of civil service examinations in meteorology, and other improvements in the service. Besides early meteorological works, he published: *The Mechanics of the Earth's Atmosphere* (3 vols., 1891-1911); *Physical Basis of Long Range Forecasting* (1902); *Relations between Climates and Crops* (1905). Professor Abbe had charge of the department of meteorology in the NEW INTERNATIONAL ENCYCLOPEDIA.

**ABKAEH.** See ARCHÆOLOGY.

**ABORTION, CONTAGIOUS.** See VETERINARY MEDICINE.

**ABYSSINIA (ETHIOPIA),** An absolute mon-

archy under a Christian sovereign—an empire composed of the kingdoms of Gojam, Shoa, Tigré, and Amhara, together with territories and dependencies whose chiefs are subject to the emperor. Addis Abeba, the capital, with between 60,000 and 80,000 inhabitants, was founded by Menelek in 1892. The population, variously estimated (8,000,000 is a figure quoted by several authorities), consists of Abyssinians (about half, who mainly profess a Coptic Christianity—monophysitism), Gallas (Mohammedans), Somalis, Falashas, and some negroes.

Grazing is the leading industry; a primitive agriculture is practiced, the soil yielding two and in some cases three crops yearly. Minerals exist in exploitable quantities. Imports through Jibuti amounted in 1911 to 22,708,001 francs, and in 1912 to 19,443,561; exports, to 18,974,926 francs in 1911 and 19,163,737 in 1912. Imports by way of Eritrea (1911), 2,320,558 lire; exports, 3,072,100. By way of the Egyptian Sudan: 1911 imports, £E40,925; 1912, £E34,280; 1911 exports, £E75,509; 1912, £E38,720. The principal articles of export through Jibuti, with value in 1912, are skins (7,663,000 francs), coffee (6,994,000), ivory (2,152,000), wax (1,248,000), rubber (389,000). The value of imports and exports through Jibuti in 1913 is given by a British authority at £736,848; through Gambela and Western Abyssinia to the Sudan, £127,647; through Somaliland, £61,700. A railway (constructed entirely by French capital) from Jibuti to Diré Dawa (187 miles) was opened in 1902; and an extension to Addis Abeba is in process of building. Telegraph and telephone lines connect Addis Abeba with Harar; and telegraphic communication exists with adjacent French and Italian colonies.

Prince Kassai of Tigré resumed the old title *negus negusti* after the overthrow by the British of Theodore, King of Amhara, in 1868; and reigned as emperor of Ethiopia until his death in 1889, when he was succeeded by Menelek II, King of Shoa. He proclaimed his grandson, Lidj Yasu, heir to the throne, and consequent upon his prolonged illness his heir took over the duties of emperor in 1910. Upon the death of Menelek in 1913, Lidj Yasu succeeded to the throne. The principal divisions with their rulers follow: Harar, with dependencies, Dejazmatch Taffari; Wollo, Mikael; Kassa and Magi, Dezejatch Katama; Goré, Dejazmatch Ganami; Tigré, Ras Seyown; Damot and Gojam, Ras Hailu; Equatorial Provinces, Fitawari Hapta Giorgis; Gondar, Ras Wolde Giorgis; Jima, Aba Giffar.

It was announced on Sept. 30, 1916, that Lidj Yasu had been deposed and was to be succeeded on the throne by his aunt, Ouizero-Zeoditu. This was followed by reports of disaffection among the followers of his father, Ras Michael, which resulted in a rebellion of a serious nature. The movement was especially strong in the interior of the country, where Michael's influence was extensive, but according to dispatches of October 30th, he was defeated and captured in a battle fought in the neighborhood of Addis Abeba, and in November it was reported that the revolution was under control. This relieved the Allies of much apprehension, especially Italy, which feared for the safety of Erythra. On the other hand the Central Powers had hoped that the movement would spread with the result of drawing troops of the Allies from Europe to protect northern Africa.

**ACADEMY, FRENCH (ACADÉMIE FRANÇAISE).** A body of distinguished men of letters, founded in 1635 by Cardinal Richelieu, the Academy was reorganized in 1816. It is the most famous of the five academies which comprise the Institute of France: the French Academy, the Academy of Inscriptions and Belles-Lettres, the Academy of Sciences, the Academy of Fine Arts, and the Academy of Moral and Political Sciences. The French Academy is the arbiter in disputed literary matters and its members are known as the Forty Immortals. At the end of 1916 there were 10 vacancies, the following having died during the year: Emile Faguet, Marquis Pierre de Ségur, Marquis de Vogüé, and Francis Chalmers (q.v.). The secretary of the Academy, who holds his position for life, is Etienne Lamy. The members in the order of their election, are as follows: Othenin P. de Cléron, Comte d'Haussonville; Charles Louis de Saules de Freycinet; Louis Marie Julien Viaud (Pierre Loti); Ernest Lavisse; Paul Bourget; Jacques Anatole Thibault (Anatole France); Gabriel Hanotaux; Henri Léon Emile Lavedan; Paul Deschanel; Edmond Rostrand; Frédéric Masson; René Bazin; Etienne Lamy; Alexandre F. J. Ribot; Maurice Barrès; Maurice Donnay; Jean Richepin; Raymond Poincaré; Eugène Brieux; Jean Aicard; René Doumie; Marcel Prévost; Monseigneur Louis Marie Duchesne; Henri de Régnier; Denys Cochin; General Hubert Lyautey; Emile Boutroux; Alfred Capus; Pierre de la Gorce; Henri Bergson.

**ACADEMY OF ARTS AND LETTERS, AMERICAN.** A body of writers, artists, and composers, limited in number to 50, chosen from among themselves by the 250 members of the National Institute of Arts and Letters. The Institute had its origin at a meeting of the American Social Science Association in 1898. The Academy was founded in 1904 with William Dean Howells as its president. Mr. Howells has since continued to hold this office. In some respects the Academy is modeled on the French Academy. It and the Institute meet together annually, the last such meeting taking place in New York, Nov. 16-17, 1916. Within the year two new members, Barrett Wendell and Gari Melchers were elected members, to take the places of James Whitcomb Riley and Henry James (q.v.), deceased. The seat of William Merritt Chase (q.v.) is vacant. On Nov. 24, 1916, the membership list was as follows: William Dean Howells, Henry Adams, Theodore Roosevelt, John Singer Sargent, Daniel Chester

French, John Burroughs, James Ford Rhodes, Horatio William Parker, William Milligan Sloane, Robert Underwood Johnson, George Washington Cable, Andrew Dickson White, Henry van Dyke, William Crary Brownell, Basil Lanneau Gildersleeve, Woodrow Wilson, Arthur Twining Hadley, Henry Cabot Lodge, Edwin Howland Blashfield, Thomas Hastings, Hamilton Wright Mabie, Brander Matthews, Thomas Nelson Page, Elihu Vedder, George Edward Woodberry, Kenyon Cox, George Whitefield Chadwick, Abbott Handerson Thayer, Henry Mills Alden, George de Forest Brush, William Rutherford Mead, Bliss Perry, Abbott Lawrence Lowell, Nicholas Murray Butler, Paul Wayland Bartlett, Owen Wister, Herbert Adams, Augustus Thomas, Timothy Cole, Cass Gilbert, William Roscoe Thayer, Robert Grant, Frederick MacMonnies, Julian Alden Weir, William Gillette, Paul Elmer More, George Lockhart Rives, Barrett Wendell, and Gari Melchers.

The first seven members were: William Dean Howells, Augustus Saint-Gaudens, Edmund Clarence Stedman, John La Farge, Samuel Langhorne Clemens, John Hay, and Edward MacDowell. William Milligan Sloane is chancellor and treasurer of the Academy, and Robert Underwood Johnson, 70 Fifth Avenue, New York City, is permanent secretary.

**ACADEMY OF SCIENCES, NATIONAL.** A body of distinguished American scientists, incorporated in 1863. Its purpose is "Whenever called upon by any department of the government, to investigate, examine, experiment, and report upon any subject of science or art." At the end of 1916 there were 147 members and 40 foreign associates. The officers were as follows: president, William H. Welch; vice-president, Charles D. Walcott; foreign secretary, George E. Hale; home secretary, Arthur L. Day; treasurer, Whitman Cross. In 1916, as the result of a movement of the Academy to mobilize the nation's science for industrial progress and military efficiency, a National Research Council was established. The chairman of the council is John J. Carty, chief engineer of the American Telephone and Telegraph Company, and a former president of the American Institute of Electrical Engineers. Drs. W. H. Welch and G. E. Hale investigated, in England, the effect of the war on scientific research and industrial progress. Within the year the Academy completed an investigation of the Panama Canal slides.

**ACCIDENT INSURANCE.** See SOCIAL INSURANCE; WORKMEN'S COMPENSATION.

**ACCIDENTS.** See RAILWAY ACCIDENTS; WORKMEN'S COMPENSATION.

**ACHURCH, JANET.** An English actress, died at Ventnor, Sept. 11, 1916. Her real name was Janet Achurch Sharp and she was married to Charles Charrington. Born in Lancashire in 1864, she made her London début in 1883, joined Beerbohm Tree's company in 1887, and two years later became manager of the Novelty Theatre. Here she presented *A Doll's House*, the first Ibsen play seen by the English public. In it she created the part of Nora, gaining thereby a remarkable reputation. Later she toured India and Australia, and in the United States, in 1895, she played with Richard Mansfield. Between 1897 and 1911, her more important rôles were: Cleopatra in *Antony and Cleopatra*, Candida in Shaw's play of that name and Lady Cicely in his *Captain Brassbound's*

*Conversion*, Hermione in *Andromache*, Queen Katharine in *King Henry VIII*, Merete Beyer in *The Witch*, Mrs. Alving in *Ghosts*, and Rita Allmers in *Little Eyolf*.

**ACTIVATED SLUDGE.** See SEWERAGE.

**ADAMSON LAW.** See ARBITRATION AND CONCILIATION, INDUSTRIAL; RAILWAYS; UNITED STATES, *Presidential Campaign*.

**ADDAMS, JANE.** See LITERATURE, *Feminism*; WOMAN MOVEMENT.

**ADEN.** A peninsula and a small strip of coast in southwestern Arabia, forming a part of the Bombay Presidency of British India. The area is 75 square miles, or with the island of Perim 80 square miles. Population in 1911, 46,165, the increase over 1901 being 5 per cent. The town of Aden is an important coaling and trans-shipment station and is strongly fortified. Trade (which is largely transit) in 1914-15, exclusive of government stores and treasure: Imports of merchandise by sea, £3,127,652; by land, £136,409; exports by sea, £2,607,965; by land, £115,481; total imports and exports of treasure, £411,948 and £540,154. In 1914-15, 1204 merchant vessels, of 3,058,771 tons (net) were entered at the port of Aden. Socotra and the Kuria Muria islands are administratively attached to Aden. The Turks in 1915 had sent troops into the eastern part of the Aden Protectorate for the purpose of stirring the natives to revolt, but on July 12, 1916, a British column attacked a Turkish force near Subar, inflicting severe losses on it, and after this it was reported that conditions were normal.

**ADMINISTRATION, COLLEGE AND UNIVERSITY.** See UNIVERSITIES AND COLLEGES.

**ADMISSION REQUIREMENTS, COLLEGE.** See UNIVERSITIES AND COLLEGES.

**ADVANCEMENT OF SCIENCE, AMERICAN ASSOCIATION FOR THE.** With 50 other societies in session at the same time, and in the same city, the American Association met in New York for its 69th annual meeting, Dec. 26-30, 1916. About 2100 of the 12,000 members were registered as present. Headquarters were made at Columbia University, where many of the meetings were held, but halls in various other institutions and in hotels were also used. The convocation, which was the first of quadrennial gatherings that are to be held successively in New York, Chicago, and Washington (with the usual annual meetings between), was the largest assemblage of scientific men ever recorded. Over the opening session, held in the American Museum of Natural History, Dr. Charles R. Van Hise, president of the University of Wisconsin, presided. Dr. William Wallace Campbell, director of the Lick Observatory, and retiring president of the Association, addressed the members on "The Nebulæ," using a notable collection of slides. There were later two public lectures, open to the people of the city, one by Dr. Simon Flexner of the Rockefeller Institute, on "Infantile Paralysis and the Public Health," and one by Dr. A. A. Noyes, of the Massachusetts Institute of Technology, on "Nitrogen and Preparedness." The problems of preparedness, from different aspects, and of national economy and conservation of resources were dealt with by a number of speakers. Among subjects which were intended to attract general rather than specialized scientific interest were: "Biology and National Existence"; "The Structure of Matter"; "The Relations of Chemistry to

Botany"; "The Adjustment of Science to Practice in Agriculture"; "Cancer and its Control"; "Highway Engineering." After its opening session, the Association broke up into its 12 sections. Addresses were made by the retiring vice-presidents, who included: Armin O. Leuschner, E. Percival Lewis, William McPherson, Bion J. Arnold, W. A. Setchell, Lillian J. Martin, George F. Kunz, who spoke on "Scientific Efficiency and Industrial Museums Our Safeguard in Peace and War," and Ellwood P. Cubberley.

The Council of the Association endorsed a resolution advocating greater use of the metric units of weight and measure in the United States. Dr. Kunz, who had been prominent in this movement, was elected president of a new society, the American Metric Association. Under the auspices of the great engineering societies, a meeting was held to discuss the interrelations of engineering and pure science. Dr. Henry M. Howe presided, and the speakers were Bion J. Arnold, past president of the American Institute of Electrical Engineers, Clemens Herschel, president of the American Society of Civil Engineers, and Dr. Ira D. Hollis, president of the American Society of Mechanical Engineers.

The Committee of One Hundred on Scientific Research heard a report from Dr. Raymond Bacon of the Mellon Institute, chairman of the committee on industrial research. It was announced that through the Colburn bequest the research funds of the Association have been increased to \$110,000. It was also announced that about 5000 members of affiliated societies had become Association members in 1916 and that the initiative of Prof. H. L. Fairchild had resulted in the establishment of a local branch of the Association in Rochester. Besides a permanent secretary, who is L. O. Howard, there is now a general secretary, Prof. J. McKeen Cattell of Columbia having been elected to this office for a five-year term. Dr. Theodore W. Richards, director of the Wolcott Gibbs Memorial Laboratory at Harvard and winner of the Nobel prize in chemistry, was elected to preside at the next meeting, which will be held in 1917 in Pittsburgh, and to give the address the following year at Boston. The following were elected vice-presidents: W. J. Humphreys (Physics), W. A. Noyes (Chemistry), George H. Perkins (Geology and Geography), Herbert Osborn (Zoölogy), Burton E. Livingston (Botany), Edward B. Titchener (Anthropology and Psychology), George W. Perkins (Social and Economic Science), C.-E. A. Winslow (Physiology and Experimental Medicine), E. F. Buchner (Education), and H. J. Waters (Agriculture). See also AGRICULTURE.

**ADVANCEMENT OF SCIENCE, BRITISH ASSOCIATION FOR THE.** The 86th annual meeting of the Association, held at Newcastle-on-Tyne September 5th-9th, was notable for discussions of a practical character relating to problems arising from the war. After the first general session, at which the retiring president, Sir Arthur J. Evans, spoke on "New Archæological Lights on the Origins of Civilization in Europe," the Association broke up into its 13 sections. The presidents of sections who delivered addresses were: Prof. A. W. Kirkaldy (Economic Science and Statistics), who discussed reconstruction after the war; Gerald

Stoney (Engineering); Rev. R. Temple (Educational); Dr. E. J. Russell (Agriculture), who spoke on increased crop production, and one of whose suggestions was answered by Sir Sydney Olivier, Secretary of the Board of Agriculture and Fisheries, who said that the board expected to establish agricultural engineering institutions; Prof. G. G. Henderson (Chemical); Prof. W. S. Bolton (Geology); Prof. A. N. Whitehead (Mathematical and Physical); Prof. Cushny (Physiological); Dr. E. B. Rendle (Botanical); and Edward A. Reeves (Geography). Aside from the presidential addresses, a few others may be noted. Sir John S. Maxwell lectured on afforestation, recommending that Great Britain be made self-sufficient as regards lumber supply. The Economics Section discussed outlets for labor after the war, especially with relation to the replacement of male by female labor; they took up also the effect of the war on credit, currency, and finance. Sir T. H. Holdich spoke before the Geographical Section on political frontiers. The Chemical and Engineering Sections together considered the conservation of coal resources. The Hon. Sir Charles Parsons, famous for his turbine engine, is the president of the British Association for 1917, when the meeting will be held at Bournemouth. See also AGRICULTURE.

**ADVENT CHRISTIANS.** See ADVENTISTS.

**ADVENTISTS.** The Seventh Day Adventists, the largest branch of this denomination, had, on Dec. 31, 1915, a total membership of 136,879, a net gain of 11,035 over 1914. The number baptized in 1915 was 17,438. Of the total membership the North American Division, including the United States and Canada, had 77,735; European Division, 37,617; Asiatic Division, 9746; South American Division, 4903; Miscellaneous Union Conferences, 6878. The North American Division had 2113 churches, 9624 persons baptized in 1915, 582 ordained ministers, 640 licensed missionaries, and 2339 evangelistic and institutional laborers. Its tithes contributions were \$1,337,810; foreign missions and other offerings, \$1,204,872; total, \$2,542,682. The total contributions of the denomination in 1915 were \$3,407,298, of which \$1,968,168 were tithes, \$872,666 foreign offerings, and \$566,463 other offerings. Church buildings and property are valued at \$14,254,615. There are 40 publishing houses. Other branches of the denomination are: Advent Christians, about 26,000 communicants, 550 churches, 528 ministers; the Church of God, about 600 communicants, 20 churches, 32 ministers; the Life and Advent Union, 509 communicants, 12 churches, and 12 ministers in 1914; and the Church of God in Jesus Christ, 2224 communicants, 68 churches, and 61 ministers in 1914.

**AERONAUTICS.** The aeronautical record for 1916 once more is concerned chiefly with military preparation and achievement, with the combative side increasingly prominent. Scientifically, technically, and industrially, every effort in both belligerent and neutral countries was being expended in increasing the efficiency and supply of the military and naval aeroplanes, so that much in this field must be considered in connection with the articles on MILITARY PROGRESS, and WAR OF THE NATIONS, to which the reader is accordingly referred.

There are, however, certain salient features that have been learned as regards European

practice and are discussed in the technical and other journals of the year, as well as developments and notable achievements in the United States that may figure in the usual record under the present title. Everywhere designers and builders were anxious to develop any promising ideas, and as soon as an aeroplane or airship was shot down or captured it was subject to minute study by the enemy's aerial experts. In this they were probably aided by information received from spies and careful observation of the flight and tactics of the hostile aircraft. Imitation of design was charged against the Germans, but their aeroplanes captured showed a wonderful unity of design, the elimination of useless features, and the perfection of useful elements and appliances. On the other hand, the ingenuity and versatility of the French in design and construction continued, while Great Britain was manufacturing approved types on an extraordinarily extensive scale. The work of the American manufacturers began to stand out preëminent, especially on the side of powerful motors and large aeroplanes, about which, however, there was comparatively little general information.

So far as the technology of aviation is concerned the efforts of designers, engineers, and practical aviators have been devoted to supplying to the warring nations more efficient machines. The result has been intense rivalry between the Entente and the Central Powers no less in laboratory and factory than in the field itself. The Entente Allies have had the advantage of being able to draw from the United States motors and machines to supplement their own types and constructions, while the Teutons, though handicapped by inferior resources, have acquitted themselves well. Thus in the early part of the year on the western front the Fokker monoplanes, which were claimed to be modified copies of the French Morane-Saulnier machines, by their fine fighting qualities aided materially in contributing to what was considered for a time German superiority in the air. But the ingenious Bleriot responded with a swift flexible monoplane known as the "Spad," which, with powerful engines, was able to outfly its adversaries, while other powerful machines were built, some of which were designed with such great lifting power and stability that they could mount guns of substantial size. Aerial combat continued to develop in importance as a function of the aeroplane. In all services the tractor biplane continued to be standard for all work except high speed observation.

In engine construction the general tendency was towards the fixed cylinder water-cooled engine in place of the air-cooled rotary engine, which was in favor before the war, especially in France. The enormous quantities of water and oil required by the lighter rotary added to the net weights of the machines, and accordingly in both France and Germany recourse was had to the automobile engineers, and efficient water-cooled six, eight, and twelve cylinder motors appeared, built in the main along similar lines to those used in racing cars. Thus the Mercedes motor of the Germans as used in 1916 was an efficient six-cylinder motor of 5.5-inch bore and 6.29-inch stroke developing 178 horse power at 1450 revolutions per minute. It was made of the strongest materials, so possessed reasonable lightness with strength.

Where power and weight-carrying capacity was demanded the fixed cylinder type was essential, but here the intensity of heat from the exploded gasoline limited the size of the pistons. Accordingly their number was increased and when more than six were used the "V"-motor with eight and then with 12 cylinders followed.

A new motor used extensively during the year was the Hispano Suiza, 1800 of which were ordered by the French government within a single month. This engine weighed but 2.42 pounds per horse power and developed 150 horse power. The American rights of manufacture were secured by the Wright and Martin Aircraft Corporation.

The Fokker monoplane employed the Oberussel nine cylinder air-cooled rotary motor, being the only German aeroplane with such a type of engine. The Gnome motor was still used on some French monoplanes, but here as in Germany and England the fixed cylinder type prevailed.

It was not generally realized that coincident with the progress seen in Europe there was taking place in the United States a free and untrammelled development of aeroplane motors. In America conditions purely commercial encouraged independent effort, and as a result there had been evolved a number of types, far more than in any single European country. It was reported that at the end of 1916 there were a dozen different types of motors ranging between 125 and 400 horse power and as many or more between 80 and 125 horse power. The United States had developed at least one type of aeroplane capable of a speed of 125 miles and another that would lift 15 tons. Power was available in all American machines, but the most usual criticism of the foreign purchasers was the lack of finish to which European mechanics have been trained.

It was reported in Great Britain that in the summer of 1916 there were not less than 500,000 people in the British air service. This included a large number of non-combatants, such as mechanics and others engaged in the manufacture of aeroplanes and aeroplane supplies. It was also stated that Great Britain was spending nearly \$250,000,000 in aeronautics in 1916 and a substantial amount was for machines and appliances of American manufacture.

In Parliament and elsewhere there was criticism of the Royal Naval Air Service and the Royal Flying Corps, and with the alleged failure of the Derby Committee to provide adequate flying equipment there was a demand for an air ministry with independent power and responsibility. There was an investigation of the Royal Aircraft Factory at Farnborough and various improvements were suggested, but commercial aeroplane firms were encouraged to manufacture the government 'planes, and from these the greater part of the war 'planes used in the British service were secured. At the end of the year Lord Cowdray, the head of the great Pearson Company, succeeded Lord Curzon as head of the Air Committee.

Naturally few new developments in Europe escape the military authorities and the censors, but a striking instance reported from England was a large flying boat made in America with wing span of over 130 feet, and powered with engines of 1000 horse power. This aeroplane with eight passengers and 600 gallons of gaso-

line was able to make a speed of over 75 miles an hour. The eight passengers were carried in an ample cabin protected from the weather. Another report from England was of a huge land aeroplane which, with 21 passengers, was able to rise to 7000 feet.

One of the more powerful American motors put out during the year was the Knox 300 horse power aeronautic engine, supplied with 12 cylinders, "V"-type, 4 $\frac{1}{4}$ -inch bore by 7-inch stroke. This engine, with its appurtenances, weighed complete 1400 pounds and would give 300 horse power with the throttle half open, leaving a substantial reserve for high altitudes.

The tendency towards providing increased power was shown in changes and improvements in the Curtiss 5x7 eight cylinder VX motor, which was rated at 160 horse power. This motor was developed to a point where it would yield in excess of 200 horse power and was accordingly rated at that figure. It was then known as the VX-3 motor and was used in the aeroplane employed by Victor Carlstrom in his flight from Chicago to Erie, Pa., on November 2nd, 452 miles in 3 hours and 57 minutes being accomplished.

Not only increased power but increased reliability was secured, and while many machines were equipped with double motors and propellers, the Curtiss twin motored tractor was able to fly and climb with one motor alone, and thus had double assurance against mishap in the event of failure of one of the engines. This biplane, so engine, was used by Victor Carlstrom. When fitted with pontoons he flew it 661 miles in 8 $\frac{1}{2}$  hours in flights for the Curtiss Marine Trophy, this mileage standing as the record in this contest up to the end of 1916.

The importance of the American aeroplane industry was shown by the organization of the Wright-Martin Aircraft Corporation to take over the stock of the Wright Company, the Glenn L. Martin Company, and other corporations. This corporation, which had a capital of \$5,000,000 preferred stock in addition to 500,000 shares common stock of no par value, was giving employment during the year to 2362 men. Another indication of the highly developed status of aeroplane manufacture was the fact that the Curtiss Aeroplane and Motor Corporation maintained an engineering department with a force of 150 men and occupying drafting rooms and laboratories covering a floor space of 30,000 square feet. The following divisions were made of the work: motor designing and testing; aeroplane designing; aeroplane development; research and test. This last named division is elaborately organized into 10 subdivisions with full facilities, the equipment being stated to be the most complete and highest grade of any aeronautical plant in the world.

As indicating the diversity and condition of the American aeroplane industry in 1916 mention may be made of the bids opened on November 23rd by the U. S. War Department for 148 service twin-motored hydroaeroplanes for coast artillery service. Twelve companies submitted proposals offering both biplane and triplane types at figures ranging on equipped machines from \$14,800 to \$29,497 each.

The official specifications required the machines to be able to rise from rough water and to ascend within 1000 feet from the starting point, with a minimum speed of 45 miles an

hour, and able to carry a weight of about 450 pounds. The companies bidding were:

Curtiss Aéroplane Company, \$22,500 each for as many machines as desired; Wright-Martin Aircraft Corporation, \$29,497 each for 12 machines and \$25,800 each for 148; Buffalo Aéroplane Company, \$14,520 each for 80; the Aéro Marine Engineering and Sales Company, \$18,000 each for 16; Albert H. Heinrich, \$12,875 each for 16; the Gallaudet Company, \$25,920 each for 32; the L. W. F. Engineering Company, \$19,000 each for 32; Benoist Aéroplane Company, \$12,000 each for 148; the Burgess Company, \$11,000 each for 24; the Standard Aéro Corporation, \$20,000 each for 148; the Cohen Motor Company, \$23,150 each for 80, and the New York Aéroplane Construction Company, \$20,000 each for 148.

The statistics of the Department of Commerce, covering the 10 months of 1916 ended with October, indicated that aéroplane exports from the United States for the year 1916 had been about \$100,000 below the shipments in 1915.

In the 10 months ended with October the value of aéroplane shipments amounted to \$3,517,399, as compared with \$3,631,546 for the same period in 1915. In the ten months of 1914 the shipments had a value of only \$214,057. It was estimated at the end of the year that the total exports of heavier-than-air machines in the entire twelve months of 1916 would approximate \$4,317,399.

England was the best customer of American aéroplane manufacturers, and it was thought that the falling off in exports in 1916 was due to the more adequate facilities of the English factories to turn out sufficient supplies. Russia, Italy, Portugal, and presumably France, of the Entente Allies, also were liberal buyers in 1916 of American flying machines.

An American improvement in aéroplane construction was the vanadium-steel aéroplane, as shown in the Sturtevant battle 'plane, designed by G. C. Loening, where all the parts were standardized and made absolutely interchangeable. This use of steel affords greater strength and generally increases the efficiency of the machines. The steel tubing was stronger than a wooden structure of the same weight, while for the fuselage a special construction of steel angles, channels, and special sections was contrived. This gave a fuselage weighing but 165 pounds as compared with 200 pounds for a wooden structure of corresponding size and strength. The engine beds were also made of steel and the development of rudders, wing flaps, and wing structure entirely of steel was in progress, the steel wings having passed successfully the severe tests to which they were submitted.

Towards the close of the year it was announced that in the proposed Polar expeditions of Capt. Robert A. Bartlett and Capt. Roald Amundsen aéroplanes and aviators would be used extensively. It was proposed not only to use the aéroplanes for scientific observations and reconnaissance but to communicate between the two ships, or in the event of the crushing of a ship or other mishap to provide assistance. One aéroplane was presented to Captain Amundsen and in the interval before the departure of the expeditions it was hoped to provide a complete aéroplane equipment, including machines with a radius of 1000 miles.

CARLSTROM'S CHICAGO TO NEW YORK FLIGHT. A noteworthy flight was started at dawn on November 2nd when Victor Carlstrom, in the Curtiss 200 horse power biplane "The New York Times," left Chicago on a trip to New York. On this flight he succeeded in breaking the American cross-country non-stop record by flying 452 miles from Chicago to Erie, Pa., and then the American speed record for cross-country flight by making the 315 miles from Hammondsport to Governor's Island, New York Harbor, at the rate of 134 miles an hour. Over 1000 pieces of mail were carried, and the success of direct aerial communication between the two cities which had been discussed since 1910 was established. The flight, begun at 6.09½ in the morning, was halted at 11.27 at Erie, to repair a slight leak in the gasoline feed pipe, but at 2.35 Carlstrom was in the air again and headed due east, landing at Hammondsport, N. Y., at 4.24. On the following morning at 6.35 Carlstrom started on his last leg, and made the 315 miles to Governor's Island in 2 hours and 21 minutes, arriving there at 8.56.

Carlstrom, earlier in the year, on August 25th, at Newport News, with a passenger, had flown the Curtiss twin-motor military biplane 641 miles in eight hours and forty minutes, and earlier in the year had flown a machine of the same type from Newport News to Sheepshead Bay. On May 24th he had flown with a passenger from Sheepshead Bay to Washington, a distance of 237 miles, in 187 minutes.

FLIGHT OF MISS RUTH LAW. On Nov. 19, 1916, Miss Ruth Law flew from Chicago, Ill., to Hornell, New York, a certified distance of 512.123 miles, thus establishing an American cross-country distance record for pilot alone, duly recognized by the Aéro Club of America, and the world's record for women fliers. The only aviator who had flown longer than Miss Law in a cross-country flight was Sub-Lieut. A. Marchal of the French army, who, on June 20th and 21st had flown in a Nieuport monoplane from Nancy, France, to Chelm, Poland, a distance of 812.5 miles, in the course of which he dropped proclamations on Berlin.

Miss Law's flying record was as follows:

Left Chicago (Eastern time) .....	8:25:00 A. M.
Arrived Hornell, N. Y. ....	2:10:00 P. M.
Left Hornell .....	8:24:00 P. M.
Arrived Binghamton, N. Y. ....	4:20:00 P. M.
Left Binghamton .....	7:28:00 A. M.
Arrived New York .....	9:37:35 A. M.

	Time	Miles
Chicago to Hornell .....	5:45:00	590
Hornell to Binghamton .....	0:56:00	90
Binghamton to New York .....	2:14:35	204
<b>Total .....</b>	<b>8:55:35</b>	<b>884</b>

An interesting feature of Miss Law's flight was that it was accomplished in a small machine, in fact about one-half in width and height that used by Carlstrom, and she had limited gasoline capacity. Furthermore, a point most favorably commented on was that the trip had been made in an almost obsolete type of American aéroplane with a common stock motor. Miss Law received many congratulations and honors on her success, including a testimonial of \$2500 from the Aéro Club of America and a large banquet tendered by the Civic Forum of New York City.

OTHER NOTABLE EVENTS. While in no way

comparable to the European bombing expeditions or reconnaissances in force, in which 60 or more aeroplanes would participate at times on the Western Front, one of the important events of the year in America on account of the number of aeroplanes participating was the flight of a squadron of 12 aeroplanes from the government aviation field at Mineola, Long Island, to Princeton, N. J., arriving in time to witness the Princeton-Yale football game. The flight was made by United States army and other aviators.

The first machine to take the air was driven by First Lieut. W. G. Kilner, United States army, in command of the squadron, and he was followed by Capt. Raynal C. Bolling, N. G. N. Y., and Capt. Ralph L. Taylor, Connecticut N. G. Then at one minute intervals the other eight machines took the air. These were piloted by Sergt. D. R. Noyes, Lieut. James E. Miller, Sergt. W. P. Willets, Lieut. Alexander B. Thaw, A. S. Adams, Sergt. J. H. Stevenson, and H. R. Blakely.

The 10 aeroplanes when over Governor's Island, New York Harbor, were joined by two others, one carrying Baker of Princeton and Cord Meyer of Yale as passenger, and the other piloted by Philip A. Carroll. The trip was made in flight formation and was the first in which so many aeroplanes had flown together across country in the United States. Two met with trouble and were forced to land, but effected repairs speedily and all arrived safely at Princeton. The return flight to Mineola was equally successful notwithstanding a heavy mist.

Another notable event in American aviation was the flight of eight aeroplanes from Hempstead Plains to Philadelphia on December 30th. Twelve machines, piloted by United States army officers, members of the Aero Club of America, or professional aviators, started in the cold at 10 o'clock in the morning, and eight machines were able to negotiate the distance of 115 miles in less than two hours. The fastest time was made by Lieut. A. M. Coyle, New Hampshire National Guard, and was 97 minutes. The eight machines that completed the full distance descended in the following order at the Philadelphia Navy Yard: Lieut. A. M. Coyle of the New Hampshire National Guard, with a passenger, 11.34 A.M.; H. W. Brickley, with C. H. Reynolds, passenger, 11.40 A.M.; Tex C. Millman, with S. A. Blair, 11.45 A.M.; Capt. J. E. Carberry, Army Signal Corps, 11.50 A.M.; Lieut. James E. Miller, New York, 11.52 A.M.; Lieut. G. Osborne, 11.53 A.M.; Leonard Barney, with Instructor Allen, 11.56 A.M.; Lieut. E. W. Bagnall, with Sergt. E. A. Krauss, 1.30 P.M. Motor troubles and minor mishaps caused the descent of four of the entrants and the extreme cold experienced caused considerable hardship. On this flight a number of new devices, including stabilizers and especially a new drift indicator were tested. The machines used were bi-planes, Curtiss military tractors, with 90 horse power motors, and carried 25 to 30 gallons of gasoline.

On the return trip on the following day a new record of 72 minutes for the 115 miles was made by H. W. Blakely, or an average speed of a mile in 38 seconds for the entire distance. Captain Carberry arrived second at Hempstead Plains with the same time and Sergeant Salmon arrived one minute later. Flight-instructor Bonney required 78 minutes in

a 135 horse power L. W. F. machine, while Lieutenant Miller made the journey in 86 minutes. Two of the seven aeroplanes starting on the return trip were forced to descend en route.

On April 30, 1916, a Curtiss Model JN machine with pilot and passenger climbed 16,500 feet in 1 hour and 30 minutes. A five passenger hydroaeroplane flew from Newport News to Baltimore on April 6th in 3 hours and 3 minutes. As already mentioned, a flight from Newport News to New York was made on May 28th, by Carlstrom in a Curtiss aeroplane with two 90 horse power motors with a load of 800 pounds in 4 hours and 1 minute.

On April 26th at Brooklands, England, H. G. Hawker attained a height of 24,408 feet in an aeroplane, thus making what was accepted by the Royal Aero Club as a world's record, since a flight of 25,756 altitude made by a German aviator, Heinrich Hoelerich, in 1914, never was recognized by that body.

PROPOSED AERIAL POST. The success of the flights of Carlstrom and Miss Law gave increased impetus to the efforts to establish aerial post routes, and on December 14th it was announced that there was tentatively under consideration in connection with the proposed appropriation of \$100,000 for experimental aerial mail service by the government, a plan for regular aerial mails between New York and Chicago. It was estimated that the trips could be made in from 6 to 14 hours, depending upon the wind, and that the average time for the 720 miles air line distance would be eight hours, mails being carried between sunrise and sunset. Each plane would carry from 500 to 1000 pounds of mail matter and commercial interests proposed to take up the establishment of such a service.

One plan outlined in the aeronautical magazine *Flying* involved emergency stations every 22 miles, each equipped with powerful search lights, two landing stations, and one relay station. "The planes would leave the two termini at 6 P.M. and deliver the mail before 9 A.M. the following day. Under the most favorable conditions, the mail would reach destination by midnight. From 500 to 1000 pounds of load or 'cargo' would be carried. Leaving New York at dusk, the air mail carrier would follow the lights at the emergency stations to the first landing station, which would be in the vicinity of Williamsport, Pa. There, at a flying field fully equipped with hangars, tools, and spare parts, he would stop for oil and gas, and would then continue to the relay station near Niles, Ohio. Here another machine would finish the flight, landing once at the second landing, near Napoleon, Ohio. One extra machine with a pilot would be maintained at each landing station and three extra machines and pilots at the relay station."

A practical demonstration of the value of an aerial mail service was afforded by the communication maintained by General Pershing's expeditionary force at Colonia Dublan, Mexico, and the United States army base at Columbus, N. M. The distance is 120 miles and an average of 66 minutes was the flying time for an aviator from the First Aero Squadron who was accustomed to transport from 250 to 300 pounds of mail.

In connection with aerial post routes it was believed that the end of the European war would

release a large number of skilled aviators who could be used commercially with corresponding advantage. While this had not been agitated in Europe to any great degree, yet it was realized.

In the United States it was thought that in addition to the 12 hour one-, two-, or three-stop aeroplane mail service between New York and Chicago, already mentioned, a two-hour non-stop flight between New York and Boston, a three-hour non-stop service between Chicago and St. Louis, and even a 36-hour six-stop service between New York and San Francisco, were possible of early commercial realization.

A noteworthy instance of the practical use of aeroplanes was the relief of the starving British garrison of Kut-el-Amara by dropping 18,800 pounds of food as well as mail and stores from April 11th to 29th.

**DIRIGIBLES.** A novelty in aeronautics for 1916 was the construction in England of combination dirigible-aeroplane machines which received the name of "Blimps." These were really miniature airships, but were found most serviceable for scout and patrol duty over the waters of the British Isles. In connection with these and other dirigibles the British developed improved forms of gas generators of increased portability. Aside from the military activity of the Zeppelins the few reports available seemed to indicate improved construction of these leviathans of the air and the L33 brought to the ground in England on September 23rd was carefully studied by British designers and air pilots in as much as it represented the most advanced practice. As a naval scout it was considered to represent the highest mark of progress, while as an aerial transport or passenger ship it had possibilities far beyond any of its pre-war predecessors. It had sufficient power for a non-stop flight of at least 1500 miles at 60 miles an hour, or better with a favoring wind, and it certainly represented some 30 per cent increase in speed over the airships of 1914. Indeed from a study of this airship British experts believed that the problem of a non-stop transatlantic flight had been solved and that a few improvements easily obtainable would make possible a 3066-mile trip from Liverpool to New York.

**AEROSTATS.** The National Balloon Race for aerostats or non-dirigible gas-filled balloons, took place on Oct. 7, 1916, from Muskogee, Okla., with six entrants, all of whom started. The gas used for inflating the balloon was good natural gas, lifting about 30 pounds to the 1000 feet. First prize was won by H. E. Honeywell, piloting the balloon *Uncle Sam*, representing the Kansas City Aero Club, with his aide, Jack Horne, covering a distance of 520 miles.

The other five entrants won places as follows: Second, E. S. Coles; third, John Berry; fourth, William F. Assman; fifth, Warren Rasor; sixth, Dr. L. E. Custer.

During the year the American Society of Aeronautic Engineers consolidated with the Society of Automobile Engineers, forming a new organization known as the Society of Automobile Engineers. The problems involved in light weight and high efficiency internal combustion engines of so many types are so closely related that it was believed that a single organization would prove more effective. **AFGHANISTAN.** A Mohammedan monarchy of central Asia. The capital is Kabul. The area of the country is estimated at about 225,000 square miles. The inhabitants are supposed to number about 5,000,000. The population of Kabul is estimated at 180,000; Kandahar, 40,000 (some estimates are higher, one being 80,000); Herat, 20,000. The Afghans, many of whom are turbulent tribesmen, engage in grazing and agriculture. Foreign trade is carried on principally with British India and Bokhara. Exports include cereals, lentils, fruits, live animals, wool, hides, ghi, silks, felts, carpets, and camels'-hair goods. Leading imports are cotton goods, tobacco, dyeing materials, sugar, and tea. According to British Indian statistics, exports of merchandise from British India to Afghanistan in the year 1913-14 were valued at £1,013,000, and imports of merchandise from Afghanistan to British India at £860,000; in 1914-15, £907,000 and £807,000. Imports from Bokhara to Afghanistan are supposed to amount to about 4,000,000 rubles, and exports the same. An indeterminable revenue is derived mainly from taxation on production, and its collection is attended with oppression and extortion. The loosely organized government is headed by an ameer, whose annual revenues probably exceed 13,000,000 rupees; from the Government of India he receives an annual subsidy of 1,800,000 rupees. The ameer in 1916 was Habib Ullah Khan; he was born in 1872 and succeeded his father, the famous Abd-ur-Rahman Khan, in 1901. The country is in the sphere of British influence, having by treaty no foreign relations except with the Government of India. In the Anglo-Russian agreement of Aug. 31, 1907, Russia recognized Afghanistan as being outside of Russian influence.

**AGRICULTURAL CREDIT.** For several years there has been carried on in the United States a widespread agitation, particularly among farmers, in favor of the establishment of some form of agricultural credit. In 1913 an American Commission of nearly 100 members made a study of farm credit methods in various European countries. Thereafter much publicity was given to the plans of the Raiffeissen and the Landschaft systems in Germany, as well as co-operative farm credit unions in Italy and elsewhere. Bills were introduced in Congress each year, but failed of acceptance because of differences in the proposals of the two Houses. Finally late in December, 1915, a sub-committee of a Joint Congressional Committee on Rural Credits completed the draft of a bill which was finally signed by the President on July 17, 1916. The fundamental principle of this act is the utilization of land values as the basis of mortgages which shall in turn constitute the security behind bonds, these bonds being sold to general investors as the source of new capital for additional mortgage loans.

The act creates a Federal Farm Loan Board

© Harris & Ewing, Washington

Left to right, seated: George W. Norris, Secretary of Treasury W. G. McAdoo, W. S. A. Smith. Standing: Charles E. Lobdell, Herbert Quick, and W. W. Flinnagen, Secretary of the Board

THE FEDERAL FARM LOAN BOARD

of five members to have direct control of a system of national land banks which are empowered to make long time loans on an amortization plan and secured by farm land mortgages. This board will control a bureau of the United States Treasury Department. The Secretary of the Treasury is ex-officio chairman of this board; and the other four members are appointed by the President and will serve in the first instance for two, four, six, and eight years respectively with an additional term of eight years in each case unless removed for cause by the President. The members of this board are: Charles E. Lobdell, Republican, of Great Bend, Kan.; George W. Norris, Democrat, of Philadelphia; W. S. A. Smith, Republican, of Sioux City, Iowa; and Herbert Quick, Democrat, of Berkeley Springs, W. Va. They will receive \$10,000 per year and necessary traveling expenses. They may not during their term of office be connected with any banking or land mortgage business. They shall appoint a farm loan registrar in each land bank district, and bank appraisers, examiners, and other necessary administrative officers.

The law required this board to divide the United States into 12 federal land bank districts and to establish in each a federal land bank. Each such bank may establish branches within its district. On November 27th the board returned to Washington, having completed an extensive investigation regarding the proper location of these districts and banks. On December 27th it announced that the twelve districts would be made up as follows: 1. Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, and New Jersey, with bank at Springfield, Mass.; 2. Pennsylvania, Delaware, Maryland, Virginia, West Virginia, and the District of Columbia, with bank at Baltimore, Md.; 3. North Carolina, South Carolina, Georgia, and Florida, with bank at Columbia, S. C.; 4. Ohio, Indiana, Kentucky, and Tennessee, with bank at Louisville, Ky.; 5. Alabama, Mississippi, and Louisiana, with bank at New Orleans, La.; 6. Illinois, Missouri, and Arkansas, with bank at St. Louis, Mo.; 7. Michigan, Wisconsin, Minnesota, and North Dakota, with bank at St. Paul, Minn.; 8. Iowa, Nebraska, South Dakota, and Wyoming, with bank at Omaha, Neb.; 9. Oklahoma, Kansas, Colorado, and New Mexico, with bank at Wichita, Kan.; 10. Texas, with bank at Houston; 11. California, Nevada, Utah, and Arizona, with bank at Berkeley, Cal.; 12. Washington, Oregon, Montana, and Idaho, with bank at Spokane, Wash. At the same time it was stated that applications for loans aggregating \$150,000,000 had already been received from 50,000 farmers.

**FARM LOAN BANKS.** The capital stock of each bank at the start must not be less than \$750,000 in shares of \$5 each. This stock may be purchased by individuals, firms, corporations, and the United States and State governments. All stock not subscribed for within thirty days after subscription books are opened will be purchased by the United States. Thereafter only farm loan associations borrowing from the banks or the United States government may subscribe for stock. The government holdings do not participate in dividends, all other shareholders participate equally in dividends. After farm loan association subscriptions (see below)

Y. B. 16—2.

amount to \$750,000 in any land bank the original capital stock shall be gradually retired. In this manner it is expected that after a time only borrowers and farm loan associations will be stockholders. These federal land banks are empowered to purchase first lien farm mortgages from federal farm loan associations and approved agents and to issue, sell, and repurchase guaranteed farm loan bonds secured by said mortgages. They are given all additional powers necessary to carry out these fundamental purposes, such as disposing of land acquired in satisfaction of debts, the deposit of securities and funds with Federal Reserve banks, the borrowing of money, and buying and selling United States bonds. On the other hand such banks cannot accept demand deposits except from their own stockholders; they cannot make mortgage loans except through agents or farm loan associations; they cannot accept anything but first mortgages and their outstanding bonds may not exceed twenty times their capital and surplus. Mortgages thus utilized must be secured by productive farm land within the same Federal district; they must not exceed 50 per cent of the appraised value of the land plus 20 per cent of the insurable value of the permanent improvements. These mortgages will be for terms of from 5 to 40 years, and payable in annual or semi-annual sums such that the principal is gradually extinguished. However, after five years the periodic payments may be increased or the entire mortgage canceled by one payment. The interest rate on mortgages may not exceed 6 per cent; and neither local associations nor a Federal bank may charge a commission. In other words, profits must come from the difference in the rate of interest of the mortgages and the bonds based thereon. But the borrower may be required to pay a fee for appraisal and searching of title. Mortgages acceptable to the land bank must be issued for one of the following purposes: to purchase land for agricultural uses; to purchase equipment, fertilizers or live stock; to provide buildings or other improvements; or to discharge indebtedness incurred for like purposes. Moreover, before a borrower may legally join a local association he must already be or contemplate becoming in the near future an actual cultivator of the soil. Single loans are limited to sums ranging from \$100 to \$10,000.

The bonds issued by the Federal land banks and based on an equal amount of the above mentioned mortgages or United States government bonds will be in denominations of \$25, \$100, \$500, and \$1000 and will bear interest not exceeding 5 per cent. These bonds are guaranteed by all Federal land banks; and they are designated "instrumentalities of the government of the United States" so as to exempt them from taxation by local civil authorities. A similar exemption applies to the stock of the banks and mortgages held by them.

**NATIONAL FARM LOAN ASSOCIATIONS** may be formed by ten or more persons already engaged or soon to engage in farming and desiring loans aggregating at least \$20,000. Such associations will be incorporated under federal control. Their shares of \$5 each will carry a double liability. Such stock may be owned only by borrowers who must subscribe 5 per cent of their loan to the capital

stock of the local association. The local association in turn must subscribe for an equal amount of federal land bank stock. The shares of local associations are subject to assessments for operating expenses when necessary. The applications of local associations will be forwarded to a land bank which will investigate the applicants and their lands. If favorable the bank will then recommend to the Federal Farm Loan Board at Washington the issuance of a charter to such association. After being thus chartered the local association can sell loans to its district land bank. It may admit to membership other land owners who seek loans, subscribe for the required proportion of the stock, and are otherwise acceptable. The local association guarantees to the federal bank the payment of principal and interest on loans and the payment of taxes. The local association may charge a commission for interest collection not to exceed one-eighth of 1 per cent semi-annually on the aggregate of loans. The local association really originates an application for a loan; the making of the loan is the work of the federal land bank which will actually complete a loan only after investigation by a government appraiser.

**AGENTS.** Where no local association is formed within one year after the establishment of the federal land banks such banks may appoint as its agent in such locality an incorporated bank, trust company, mortgage company, or savings institution, subject to the approval of the Federal Board. Such agent may negotiate loans on the same basis as the local associations above described except that the borrower now subscribes directly 5 per cent of his loan for federal land bank stock. Such agents may charge a commission of not more than one-half of 1 per cent per annum on loans outstanding, but such commissions must be paid from dividends declared on the borrower's stock in the federal land bank. The borrower must meet the expenses of appraisal and title examination. A very important provision regarding agents is that which requires them to guarantee the payment of principal and interest. Many States prohibit banks giving such guarantees and doubtless many not thus prohibited will hesitate to assume the responsibility.

**JOINT STOCK BANKS.** The act also permits the establishment of private corporations to be known as joint stock land banks, formed by ten or more persons for the purpose of making farm loans. These must have at least \$250,000 fully paid up capital before issuing any bonds. Their stock will carry a double liability. They may issue bonds up to 15 times their capital stock and surplus. The United States may not be a stockholder. Such banks may make loans in excess of \$10,000 and the purposes for which such loans are made are unrestricted. Interest charges, however, may not exceed 6 per cent; no commissions may be charged; and the plan of amortization applies to repayment of loans.

**AMORTIZATION PLAN.** By this plan of payment is meant the gradual reduction of a loan by annual or semi-annual payments which cover not only interest but a portion of the principal. Thus a loan of \$1000 at 5 per cent for 20 years would be extinguished by 20 annual payments of \$80.24. The interest the first year would be

\$50 and the amount of the principal canceled \$30.24. Thereafter each year the interest would diminish and the amount applicable to principal would increase. A debt of \$1000 bearing 5 per cent interest would be similarly canceled by forty annual payments of \$50.52.

**CALIFORNIA.** A cooperative inquiry was begun in California and continued throughout the summer and fall into the question of land settlement and rural credits. This investigation was carried out by the State Rural Credits and Land Colonization Commission, the University of California, and the Commonwealth Club. It was due in part to the extensive interest in mortgage loans to farmers and in part to a desire to increase the utilization of vacant land which has been increasing rapidly in value. The above Commission was required to report its recommendations to the State Legislature in 1917.

See CREDIT UNIONS.

**AGRICULTURAL EDUCATION.** In the United States the State colleges of agriculture continued during the year the steady growth of the past ten years, during which time their enrollment of regular four-year college students in agricultural courses has been increasing at a rate varying from 12 to 20 per cent each year. Unusual interest in administrative problems has been evident, due in part to the growth of the regular teaching division and to the difficulties in adjustment to enlarged functions resulting from an exceedingly rapid development in agricultural extension teaching. The principal adjustments being made are those concerning the relations of the three divisions, research, teaching, and extension, to the chief administrative officer, and the interrelationships between the three divisions.

Extensive studies of problems relating to the administrative questions before the agricultural colleges are being made by the Committee on College Organization and Policy of the Association of American Agricultural Colleges and Experiment Stations. During the past year two studies have been completed: One on the composition, manner of selection, terms of office, and functions of the boards of control of the institutions; the other on the organization as affected by the development of extension-teaching divisions. This latter is to be published by the Committee.

Among the noteworthy reorganization in general control during the year was that in Maryland. The State Legislature early in 1916 granted a new charter to the institution, which in the past was owned in part by private interests. These interests were purchased by the State, so that the college is now entirely under State control. A new board of trustees was formed, and the institution was given largely

increased State appropriations. At the same time that the Legislature provided for this reorganization, it provided also for uniting several State boards having to do with agriculture into one central board. The new board of trustees of the college has been named as this central board, so that it has not only the supervision of the college and its activities, but also the general agricultural control work frequently under the supervision of other State boards of agriculture.

The rapid growth of the agricultural colleges, with the increasing sphere of influence due in some measure to the extension teaching, has forced into prominence the question of the relationship of these institutions to other State educational institutions, especially to the State universities in several States where the two are now separate institutions, resulting in duplication and competition for appropriations. During the year three States, Iowa, Washington, and North Dakota, attempted to find a solution by having surveys made of their institutions and their work by the United States Bureau of Education. The Bureau's investigations were completed and reports have been printed and distributed.

One of the proposals made by the Bureau as a means of settling the difficulties arising from duplication, is the adoption of the principle of "major and service lines of work." In accordance with this principle each State institution would have assigned to it certain major fields which it might be expected to develop to their fullest extent. Service lines are such subordinate subjects as are essential to the proper cultivation of a major line. Agriculture at the State colleges of agriculture is, of course, a major line. Languages, history, and political science are major lines in a State university. English is a service line in the agricultural colleges and may be a major line in the university.

The Graduate School of Agriculture, under the auspices of the Association of American Agricultural Colleges and Experiment Stations, was held at the Massachusetts Agricultural College, Amherst, Mass., during July. This was the seventh session of the school. Dr. A. C. True, Director of the States Relations Service of the United States Department of Agriculture, again served as dean. The three principal topics taken up during the four-weeks' session were (1) factors of growth of plant and animal life; (2) agricultural economics and rural sociology; and (3) fundamental problems of intensive agriculture. The attendance, made up principally of members of the teaching, research, and extension staffs of the agricultural colleges, indicated that special needs are being met by this graduate school and that there will be a place for it in the American educational system for some time to come.

The rapid growth of the colleges in enrollment has forced unusual activity in building operations. During the year Arizona completed an agricultural building costing \$165,000; Alabama, a hog-colony serum plant costing \$25,000; Colorado erected a central meeting station costing \$85,000; Delaware had under way a new agricultural building to cost \$300,000; Georgia provided a building for agricultural engineering costing \$25,000; Illinois expended \$360,000 on a chemical laboratory and \$120,000 on a ceramic building; Purdue University of

Indiana built a new veterinary building at an expenditure of \$50,000; Oregon had under construction a \$40,000 forestry building; South Dakota had under construction a dormitory which would cost \$75,000; and West Virginia started work on a \$100,000 agricultural building and recently purchased 600 acres for instruction and experimental purposes.

**AGRICULTURE IN HIGH SCHOOLS.** Statistical information collected during the year shows that approximately 2500 public high schools in the United States, or nearly one-fifth of the total number, were teaching agriculture. About one-third of the courses given in these schools were primarily vocational in purpose; the others were for general information. One-half of the schools teaching vocational agriculture were following the home-project method; that is, each student carried on at home under the direction of the school a complete farming project, such as raising a particular crop, including all operations from the selection of the seed to the disposal of the harvest, or the full care of two, three, or four dairy cows of the home herd for a twelve-months' period, etc. The schools teaching through the home-project plan are most numerous in the Northeastern States and in Louisiana. In them trained teachers are employed for twelve months in the year, devoting their summer months to the supervision of the home work of their pupils.

One-half of the 2500 schools teaching agriculture gave no practical work, confining themselves entirely to classroom and laboratory instruction with occasional visits to neighboring farms. The instruction was given by nearly 2700 persons, 10 per cent of whom were women. About one-third of the 2700 teachers had had special training in agriculture in institutions of college grade; only one-eighth had had the equivalent of a full four-year course in a State agricultural college.

The number of pupils studying agriculture during the past year in these 2500 schools was approximately 45,000, of whom 14,000 were girls. The courses varied from a few weeks in length to a full four years. In many of the home-project schools one-half of the entire time of the pupil was devoted to agriculture, including the time spent in classroom, laboratory, and in the performance of the home-project itself.

College entrance credit is now given for high school agriculture by 44 of the State colleges of agriculture and mechanic arts or the institutions of which they are a part. The amount of credit is from one-half to four units, and is given for admission not only to the agricultural colleges but to all departments of the institutions.

**SPECIAL AGRICULTURAL SCHOOLS.** The number of special agricultural schools below college grade maintained in the United States during the past year was approximately 75. This includes only institutions supported in whole or in part by the States. They received during the year about \$800,000 of public money from State and county treasuries and other sources. They had 6500 pupils in agricultural work and approximately 450 teachers. Practically all the agriculture in these schools was taught by graduates of State colleges of agriculture.

These 75 schools do not include the secondary agricultural schools maintained by ten of

the State agricultural colleges, nor the one- and two-year agricultural courses below college grade given by twenty others.

An interesting new special agricultural school was opened during the year at Farmingdale, Long Island, by the State of New York. It is teaching practical farming and gardening to city boys. Farm boys are not excluded, but the instruction and practical work is arranged for boys without farm experience and not familiar with ordinary farm operations. Nearly its entire enrollment is made up of such boys, mostly from New York City.

The permanency of the interest in agricultural education is evidenced by the amount of time given to its discussion at educational meetings during the year. It continues to have a very prominent place on the programme of the National Education Association, the Department of Superintendence, and the American Association for the Advancement of Science. An unusual meeting of international importance was the Pan-American Scientific Congress, held at the close of 1915 and beginning of 1916. Its section on education devoted a relatively large part of its time to agricultural education. It was evident that the question is important in the other American countries as well as in the United States, by the great amount of interest manifested by the delegates from these countries who were very eager in their search for information.

**AGRICULTURAL EDUCATION IN EUROPE.** The Secretary of the British Board of Agriculture and Fisheries stated during the year to the House of Commons that while the British scheme of agricultural education had been retarded by the war, the popularity of agricultural education had undoubtedly increased and that there had been real progress in the use made by farmers of the facilities offered. He expressed the belief that no previous expenditure had helped in the present war more than that for agricultural education.

Very many of its agricultural colleges have felt the effects of the war. The Royal Agriculture College at Cirencester and the Agricultural and Horticultural College at Uckfield have been closed, and Armstrong College has been taken over as a military hospital, its agricultural department being temporarily housed in a dwelling.

Many of the French schools of agriculture had to close their doors on the outbreak of the war, but arrangements have since been made to open a part of them. The national schools of agriculture at Rennes and Montpellier are being occupied by the sanitary service. A considerable number of the practical schools of agriculture and the farm schools have resumed operation, and several of these are receiving soldiers injured in the war.

In Austria twelve farm schools, thirty-five winter schools, and seven elementary forestry schools were temporarily closed on account of the war. Several minor institutions in Germany closed their doors temporarily, and the courses and attendance at the larger colleges were much affected.

**AGRICULTURAL EXPERIMENT STATIONS.** The organization of agricultural extension work in the United States on a nationwide scale is having a noticeable effect on the experiment stations, in emphasizing the impor-

tance of their work as the substantial basis for teaching, and in allowing them to confine themselves more generally to experiment and research. It has therefore given the stations an enlarged opportunity and their work an additional significance.

The revenues of the American stations the past year aggregated something over \$5,000,000, approximately \$2,000,000 of which was derived from direct appropriations by the States. The personnel of their staffs included nearly 1900 persons.

A monument to the memory of Hon. William H. Hatch, through whose instrumentality the Federal act establishing the American system of experiment stations was provided, was erected at Hannibal, Missouri, his former home, and dedicated during the fall of 1915.

Dr. Joseph H. Kastle, director of the Kentucky Experiment Station, and an investigator of wide reputation, especially in the field of biological chemistry, died Sept. 24, 1916.

An addition to the group of agricultural buildings at the California University and Station, to be known as Hilgard Hall, has been planned and authorized, with an appropriation of \$350,000. A set of buildings for the Citrus Sub-station, at Riverside, California, on its new permanent site, are under way at a cost of \$125,000. A new building for the work in genetics at the Illinois Experiment Station, and a new barn for the use of the department of experimental breeding at the Wisconsin Station, have been provided. In New York, a \$100,000 building for administration, library, and auditorium has been provided for the State Station at Geneva. Active work has begun on the new sub-station in Arizona, situated in the Salt River Valley and consisting of a tract of 160 acres. This farm will be devoted to experiments in horticulture, agronomy, and animal husbandry, and the experimental work in irrigation will be mainly conducted there.

A tract of land in the Matanuska Valley of Alaska, through which the new government railroad is being built, has been set aside by presidential proclamation for an agricultural experiment station, in addition to the four stations already in operation. This and adjoining valleys contain approximately 1,200,000 acres of land which have been shown by survey to be suited to agriculture, and special problems of the region require a station to aid the prospective settlers. Congress has been asked for an appropriation to support the new station.

The Legislature of Massachusetts provided for a market garden sub-station, to be conducted under the direction of the main station at the college but situated in the market gardening region. In the State of Washington an additional sub-station was established at Lind, for experiments in dry land agriculture.

The Nevada Experiment Station has instituted studies in the methods of range improvement on quite an extensive scale, in charge of a newly appointed specialist in range management. This is an important subject in many of the Western States, where the range system prevails extensively and where through improper management the ranges have become greatly diminished in carrying capacity. As these tracts have now come largely into private ownership, improvement is feasible when practical methods can be worked out.

What is practically a privately supported experiment station for animal diseases has been established by the Rockefeller Institute. A tract of 400 acres of land has been purchased near Princeton, New Jersey, and a laboratory, the erection and equipment of which is expected to cost nearly a million dollars, was nearing completion at the close of the year. The investigations are under the direction of Dr. Theobald Smith.

As was natural, the war has had a considerable effect on the experiment stations in Europe. There has been a decrease in the kind of activity which has characterized these stations in normal times. In general their investigation has taken a more severely practical form, and has consisted to a considerable extent of advisory work and the making of tests and trials of various kind growing out of the necessities which the countries have been under. In some countries rules for the practical farmer have been worked out, and elsewhere tests have been made of new materials to serve as substitutes in fertilizing, feeding, spraying, etc., and to replace the necessities of life in time of scarcity and high prices. The war has called many of the workers into the ranks, resulting in a considerable number of deaths, and others have had their activities diverted to aiding the country in maintaining food supply for the people and the soldiers, and to the making of serum, war munitions, etc. In general, the results which the stations have secured in the past have become a source of great strength and resourcefulness, and have been drawn upon to a hitherto unprecedented degree of application.

The appropriation for agriculture in Canada for the year 1916-17 aggregates \$3,258,000, including \$846,000 for the experimental farms and approximately \$1,700,000 for investigation, control functions, and other activities for the benefit of the industry.

An agricultural station has been established at Bie on the Benguela plateau in Angola. Experiments in cotton-growing are among its lines of work.

A new experiment station has been opened in Burma, to be devoted to wheat and other crops of the southern Shan States.

In Denmark a new horticultural station has been established at Blangsted pr. Odense, and the one at Esbjerg has been enlarged and taken over by the state as a branch station. A third station is to be established in Northern Jutland.

A tract of state land in Honduras, about five miles from Tegucigalpa, is being developed for experimental purposes, and it is hoped eventually to maintain a complete experiment station and agricultural school.

**AGRICULTURAL EXTENSION WORK.** Coöperative extension work in agriculture and home economics as provided for in the Smith-Lever Act of May 8, 1914, and other Federal and State legislation, was carried on in 1916 in all the States. This work involved the coöperation of the United States Department of Agriculture, the State agricultural colleges, and a large number of county governments and organizations. In addition, State departments of agriculture and education, county and local school officers and teachers, associations of farmers and of business men aided the extension enterprises. In the United States Department

of Agriculture the States Relations Service has general charge of extension work and through this Service arrangements are made for the extension work carried on by the different bureaus of the Department in coöperation with the State colleges. In each State college this work is managed by a director of extension work, who acts as the joint representative of the college and the Department of Agriculture. In 37 States a separate officer is in charge of the extension work; in 11 States this officer is also director of the experiment station or head of the college of agriculture.

The main features of this coöperative extension system are (1) the county agricultural agents (men), (2) the county home demonstration agents (women), (3) the boys' and girls' clubs, (4) the movable schools of agriculture and home economics, and (5) the supporting work of the college and Department specialists.

The county agents have permanent headquarters within their counties and act as joint representatives of the local community, the State college, and the Department of Agriculture. The salary and expenses of the agents are provided from Smith-Lever funds, State and county appropriations, contributions by associations of farms and others, individual gifts, and funds of the United States Department of Agriculture. The average annual salary of a county agent is from \$1500 to \$2000 and the total annual budget is about \$2500. About three-quarters of the agents are graduates of agricultural colleges. Farm experience is a universal requirement. As a rule the agents are mature men, their average age being over 30 years. While most of the agents maintain offices and have at least one regular office day each week they spend a large share of their time with the farmers in their fields, barns, and homes. They also hold or attend numerous meetings of farmers. The agents conduct field demonstrations with crops, fertilizers, methods of tillage, and in control of plant and animal diseases, and aid in the introduction of better live stock, farm and home sanitation; business methods and marketing; formation of coöperative associations; improvement of country roads, schools, and community interests. They bring in and apply the results of the researches of the experiment stations and Department of Agriculture and disseminate the practical results already attained by successful farmers. They make much use of the local and agricultural press, and of college, station, and Department bulletins. The most successful agents are educators and organizers who influence the farmers by broadening their outlook and getting them to study their own needs and take measures to help themselves.

To support these agents county associations, often called farm bureaus, have been formed. These commonly take the initiative in securing local financial support for the agent, join in his selection and appointment, and aid him in his work. They may also through their own officers engage in various coöperative enterprises. In other cases the agent is aided by community clubs, which may sometimes be federated into a county organization, or by existing granges and other farmers' organizations. Experience has shown that while the sympathy and aid of all classes of people is very desirable, the associations actively supporting the county agents

should be made up chiefly of farmers and be managed by farmers.

The force of men agents in counties organized under this plan increased from about 1100 in 1915 to nearly 1300 in 1916. During the year in the 15 Southern States demonstrations were conducted under the supervision of the county agents by about 110,000 farmers, involving the growing of crops on 1,500,000 acres from which records were obtained, showing on the average an increase of production and profit of 100 per cent over ordinary yields and profits. More than 50,000 head of pure bred or high grade animals were purchased for breeding purposes and over 4600 silos were built. Over 1,700,000 head of live stock were treated for various diseases on advice of the agents. Much attention was given to the feeding of dairy cattle and marketing of the products. The agents made over 600,000 visits to farmers and addressed over 16,000 meetings with an attendance of 1,200,000. Over 1700 community organizations were perfected with a membership of about 45,000. In the Northern and Western States about 108,000 field demonstrations were conducted and over 1,700,000 people were reached through meetings. About 81,000 farmers were enrolled in the farm bureaus. Nearly 80,000 cows were tested for milk production through associations and individuals, and about 8000 pure-bred animals were purchased. Much aid was given farmers in the control of blackleg, anthrax, hog cholera, foot and mouth disease, and other animal diseases. Spraying demonstrations were conducted in a large number of orchards. In the case of oat smut an average increase of nearly 9 bushels resulted from treatment of seed with formaldehyde and this increase was obtained at a cost of less than 10 cents. Farmers' exchanges were organized in connection with many of the farm bureaus. Among other things over 5000 laborers were placed through these exchanges.

The women county agents, often called home demonstration agents, were until recently employed exclusively in the Southern States. On July 1, 1916, there were 466 such agents in the South and 12 in the North. In this work also great attention was paid to community organizations and about 650 such organizations of farm women were formed. These agents gave instruction to over 80,000 women and girls. The work began as a rule with an effort to increase the earnings of the women through the home garden, canning and preserving, marketing of eggs, butter, fruits and vegetables, poultry raising, etc., and the improving of the farm diet. Home sanitation, use of labor-saving devices, combating of insect pests, sewing, care of children, and beautification of the home also received attention.

Demonstration work for negroes has been organized in 11 Southern States with 51 men and 5 women negro agents. Frequently the negro people have made financial contributions to this work. These agents are coöperating closely with the schools for negroes. Through this work thousands of negro land-owners and tenants are being helped. Special stress is laid on the production of home supplies for the family and live stock and on the improvement of sanitary and home conditions.

To supervise the work of the county men and women agents, State and district agents were

employed, who also aided in organizing new counties.

The boys' and girls' club work continued to grow in importance during 1916. Over 285,000 boys and girls were enrolled. In the Southern States this work was organically connected with the county-agent system; in the other States it was organized separately. The clubs are in many cases closely connected with the schools through the coöperation of State and local school authorities and the teachers. Often the club work is adopted as a home project and thus made a part of the school work. In many places paid local leadership for the summer vacation is being provided. This has resulted in a larger number of club members carrying their work through to completion. The prize feature of this work is being less emphasized and such prizes as are given are more generally encouragements to education, such as scholarships to short courses at agricultural colleges. Leading activities were the competitive growing of crops, raising of pigs and poultry, canning of vegetables and fruits, and making of home gardens. In many cases the financial returns from sale of club products were considerable. Congress made a special appropriation of \$15,000 for an exhibit of club work at the National Dairy Show at Springfield, Mass., October 12-21, 1916. This consisted of exhibits of products, demonstrations, and judging contests by teams of boys and girls from 10 North Atlantic States.

Short courses in various branches of agriculture and home economics, often called movable schools, were held throughout the country. These usually occupied from three to five days and were supplemented by numerous meetings of farm men and women. About 1500 movable schools were held in 1916, with an attendance of 200,000.

The force of extension specialists, with headquarters at the agricultural colleges, numbers over 1000 men and women, representing many branches of agriculture and home economics. These officers supplemented the work of the county agents, furnished them advice and assistance, gave instruction in the movable schools and meetings, prepared publications, and answered inquiries. Specialists were also sent out by the Department of Agriculture to work with the extension agents in such lines as tick eradication, hog cholera control, marketing of farm products, and home canning of vegetables and fruits. In 25 Northern and Western States the Department, in coöperation with the colleges and counties, conducted demonstrations in farm management. In 1916 analyses were made of the business of over 15,000 farmers, with the result that over 6000 began keeping farm accounts and many made changes in their methods of farming, putting it on a better economic basis.

For the fiscal year beginning July 1, 1916, the total fund available for extension work from Federal, State, and local sources was about \$6,100,000. Of this, about \$1,200,000 was derived from direct appropriations of the Department of Agriculture and \$1,580,000 from the Smith-Lever Act, making the total Federal contribution \$2,780,000. This was met by approximately \$3,320,000 from sources within the States, including \$1,100,000 to offset the equivalent allotment of Federal Smith-Lever funds, \$600,000 from additional State appropriations,

\$140,000 from college funds, \$1,245,000 from counties, and \$370,000 from local organizations and miscellaneous agencies. About \$3,100,000 was to be used for the demonstrations and other activities of the county agents. Much of their work bore directly on farm-home problems, but \$770,000 was allotted to distinctive work in home economics. More than \$350,000 was to be used for work among boys and girls. Over \$1,000,000 was to be devoted to the tasks of the specialists.

Farmers' Institutes were held in 1916 under the management of the State departments of agriculture in 10 States. The number of such institutes was 5010 (with 12,010 sessions), with a total attendance of 1,606,806. In 29 States the institutes were managed by the agricultural colleges, and were as a rule made a part of their extension work in agriculture.

**AGRICULTURAL LEGISLATION.** LEGISLATION IN THE UNITED STATES. The Federal legislation of 1916 was unusually important. The Legislatures of only 13 States were in session, but a number of laws of general interest were enacted by them, especially along economic lines.

The Federal Farm Loan Act, described elsewhere (see AGRICULTURAL CREDIT), was the most noteworthy measure of the year. An amendment to the Federal Reserve Act of 1913 extended the powers of some National Banks by permitting loans on farm lands outside their reserve districts but within 100 miles of the bank. South Carolina authorized a commission to consider the need of a State rural credit system. In New York, bonds of the State land bank were made legal security.

The United States Cotton Futures Act of 1914 was substantially reënacted, thereby overcoming the charges of unconstitutionality previously noted (see YEAR BOOK, 1915). The United States Grain Standards Act, under which the Secretary of Agriculture is authorized to establish official grain standards and to license grain inspectors, is described elsewhere (see AGRICULTURE).

The United States Warehouse Act established a standard warehouse receipt for cotton, grain, wool, tobacco, and flaxseed, and provided a voluntary system for the Federal licensing of bonded warehouses and warehousemen. It is believed that the receipts from these warehouses will constitute reliable evidence as to the grade, quantity, and ownership of the products for which they are issued, and thus become more easily and widely negotiable as collateral for loans and in this way assist in financing crops.

The licensing and bonding of commission dealers in farm produce was required in Virginia, where a division of markets was also established to study the cost of food production, assist in organizing cooperative societies, publish information on marketing questions, investigate complaints as to the transportation of farm products, etc. Rhode Island authorized the formation of agricultural or dairy cooperative associations under prescribed regulations. In Mississippi municipalities were prohibited from preventing by legal regulations retail sales of foodstuffs by the producer direct to the consumer. Aside from a levee tax on cotton, all farm products grown within the State were also exempted from taxation for two years after harvesting.

An appropriation of \$20,000,000 was made in the National Defense Act to construct and operate one or more plants for the manufacture of nitrates and similar materials. This action was taken primarily to insure a supply for munitions of war, but it was anticipated that the surplus would be available for the manufacture of fertilizers. The U. S. Department of Agriculture also received \$175,000 with which it was planned to erect an experimental plant for demonstrating the manufacture of potash from kelp on a commercial scale. Maryland authorized its State lime board to operate a plant to convert oyster shells into agricultural lime and sell the product to farmers at cost, and South Carolina attempted State purchases and sales to farmers of crushed marl and ground limestone.

The standardization of the so-called "Climax" grape baskets and similar containers for fruits and vegetables in interstate commerce is provided in a Federal law effective Nov. 1, 1917. The "Climax" baskets must contain two, four, or twelve quarts dry measure, while other types of baskets and containers used for small fruits, berries, and vegetables must be of one-half pint, one pint, one quart, or multiples of one quart dry measure.

A new apple-grading law was enacted in Maryland, and the Massachusetts law was amended. Provision was made in California for the grading and labeling of milk, and restricting the retail sale of all unpasteurized milk or dairy products, except cheese, to the product of animals passing the tuberculin test.

The Federal Seed Inspection Act of 1912 was amended to include vetch and rye grass, and by prohibiting the importation of seed of Kentucky and Canada blue-grass containing less than 50 per cent of live pure seed and of all other seed subject to the act containing less than 65 per cent of live pure seed. New seed laws were also adopted in Kentucky, Maryland, New Jersey, and Virginia.

Other inspection laws amended were those of South Carolina for fertilizers, Maryland and Virginia for agricultural lime, New Jersey and Virginia for feeding stuffs, and Maryland and Massachusetts for nursery stock. The inspection of apiaries was begun in Maryland and of creamery glassware in New Jersey. Stallion registration was required in New York. Oklahoma enacted a hog cholera law with a system of inspection and quarantine and regulations as to the production and use of serum, and Mississippi provided State compensation for animals condemned for contagious diseases.

The duties of the Maryland State Live Stock Board were transferred to the State Board of Agriculture. A system of State registration of cattle brands was provided in Mississippi, and the experiment station was directed to sell its surplus pure-bred eggs, chickens, hogs, and bulls to residents of the State at cost.

New Jersey established a State Department of Agriculture with a secretary, a State Board of Agriculture, and bureaus of (1) animal industry, (2) lands, crops, and markets, and (3) statistics and inspection. A State Agricultural Society was incorporated in Maryland.

The Virginia laws relative to larceny were amended by including the failure to perform farm labor promised in return for provisions.

A bill authorizing Federal appropriations of

from \$500,000 to a maximum of \$3,000,000 per annum for cooperating with the States in paying the salaries of teachers and supervisors of agricultural subjects in secondary schools, as well as a like amount for instruction in industrial subjects, and from \$500,000 to \$1,000,000 per annum for the preparation of teachers and supervisors along these lines, passed the Senate July 31, 1916. The passage of this measure was recommended by President Wilson in his address before Congress, December 5th. A somewhat similar bill was pending before the House at the close of the year.

In Massachusetts a special commission was appointed to study agricultural education as related to the Massachusetts Agricultural College and the development of the State's agricultural resources. Provision was also made through a referendum for the establishment of local schools under the supervision of the State Board of Education for teaching agriculture and horticulture to families and individuals in day, part-time, or evening classes. South Carolina adopted the policy of State aid to agricultural instruction in the public schools, and Mississippi prescribed a uniform course of study for its agricultural high schools.

**FOREIGN LEGISLATION.** Much of the agricultural legislation abroad dealt with conditions brought about by the European war, especially in relation to the conservation of the food supply, and is referred to elsewhere (see **AGRICULTURE; FOOD AND NUTRITION; etc.**).

In British Columbia and New Brunswick returned soldiers are to be given special privileges in the purchase of lands, and the receipts from the sale of these lands are to constitute a fund for loans to the soldiers for making improvements on their preëmptions. Provincial loans for drainage work were authorized in Prince Edward Island.

In order to encourage live stock improvement, the Bank Act of the Dominion was amended to permit bank loans to stock raisers with the live stock as security. Manitoba provided for the organizing of settlers into groups of 10, each member then to receive not over five head of cattle from the province, for which payment would be made in five annual installments. Saskatchewan amended its stallion registration law by requiring the enrollment of all males offered for service, and Manitoba by prohibiting the use of other than pure-bred sires. Alberta provided for additional live stock inspection and Quebec and Ontario for additional compensation to sheep owners for damages from dogs.

In British Columbia creameries, dairies, and milk testers must now be licensed and the value of milk and cream purchased certified to by licensed inspectors. Ontario also regulated testing, required payments on a basis of the fat content, and ordered the pasteurization of whey and similar by-products. Manitoba required the licensing of skimming and cream receiving stations, and Prince Edward Island authorized the closing of cheese factories not conducted in a sanitary manner. Manitoba enacted a new noxious weeds law and Nova Scotia provided for apiary inspection.

During the year the *Annuaire International Legislation Agricole*, the usual very complete annual compilation of the world's agricultural legislation, was issued for 1915 by the International Institute of Agriculture.

**AGRICULTURAL SOCIETY, NATIONAL.**  
See **AGRICULTURE.**

**AGRICULTURE. CROP CONDITIONS.** There were unusual difficulties in securing reliable data as to the crop conditions in Europe, and as a result the preliminary reports were late and at best estimates based on fragmentary data. The results issued by the International Institute of Agriculture at Rome near the close of the year showed that in the northern hemisphere the crops of wheat, barley, oats, and maize were decidedly less than in 1915, although the yield of rye was only slightly lower. Compared with the 5-year average, the 1916 crops of wheat and maize were seriously deficient, but rather larger than the average in the case of barley and oats, and decidedly so in the case of rye. The deficiency of wheat was nearly one-fifth compared with 1915. The area under wheat in Great Britain showed a reduction from the large acreage of 1915, but with that exception was the largest since 1899. The Argentine crop was estimated at about half that of 1915, but the Australian crop was placed about 4 per cent above the average. The Institute estimated the wheat crop of the world's most important producers at 2,500,000,000 bushels, or 25 per cent less than in 1915. The potato crop was below normal in many countries.

Among the general disadvantages which European agriculture has been under are a scarcity of labor, much of that available being unskilled, deficient supply and high price of fertilizers, difficulty of obtaining work animals, the high price and often scarcity of petrol for operating tractors and agricultural machines, the hindrance to trade in these machines, and the scarcity and rise in price of seed. The very high prices of forage, the requisitioning of large amounts for the armies, the reduction of certain feeds by closer milling to give a larger yield of flour, and the establishment of maximum and requisition prices in many states are among other difficulties which tended to interfere with production. Maximum prices were fixed during the year for wheat, rye, and oats in Germany, Austria, and Hungary, also for wheat in France and Italy, for oats in France, and for corn in Hungary and Italy.

In the United States 1916 was an off year for production of most of the large staple crops. The December estimates of the U. S. Department of Agriculture showed that wheat, corn, and potatoes were considerably below the crops of 1915 and the 5-year average; oats, rye, and barley were below 1915 but above the 5-year average; while hay was above 1915 and the 5-year average, and rice and tobacco were record crops. Cotton production was slightly above that in 1915, but more than two and a half million bales below the 5-year average. Spring wheat was less than half a crop and much of it was of poor quality and unfit for milling. The total wheat was far below last year's crop, and potatoes showed a shortage of nearly 75,000,000 bushels compared with the previous year and the average for five years.

Despite the relatively low yield of most crops, unusually high prices at the farm for most products gave the year's production a total farm value it has never before reached. The corn crop was valued at over \$2,000,000, and the wheat, hay, and cotton crops at over \$1,000,000 each at the farm. The combined farm value of

the principal farm crops was \$7,113,151,000, as compared with \$5,421,390,000 in 1915, showing that large crops do not necessarily mean correspondingly large financial returns to the farmers. As a matter of fact, as has recently been shown by a statistical study, bumper crops with all the extra labor they involve usually bring the farmers shorter returns than the lean ones, and especially so when considered on a world scale.

The Secretary of Agriculture called attention in his annual report to the sharp fluctuations of yield and prices from season to season which tend to stimulate speculative and superficial farming, and urged as one of the greatest agricultural needs the stabilizing of production. In a large measure this must be brought about through the use of better adapted or improved crop varieties, more systematic and rational crop rotations, and improved agricultural practice generally, including in many sections larger attention to live stock production.

**WORLD CROPS.** The International Institute of Agriculture at Rome has issued estimates of the world crops of wheat, rye, oats, barley, and maize (corn) as shown in the accompanying table. In these estimates, the production in Germany, Austria-Hungary, Belgium, Bulgaria, Denmark, France, Rumania, Russia in Asia, Algeria, and Sweden is assumed to be the average for the five years 1909-13, as the returns for 1916 for these countries are incomplete.

**AGRICULTURE AND THE WAR.** The effects of the war on agriculture have continued to transcend all other matters relating to that industry in Europe. With the progress of the war, the preëminent position of agriculture in the welfare of the countries involved and as an element in the national defense has become more evident. Its importance is now conceded as second only to that of the military activities. The problem of maintaining, and in most cases increasing, the production of food for man and beast has taxed to the utmost the farming resources of the countries at war. With thousands of acres devastated, relations with other countries interrupted, and a vast number of the farmers and farm laborers drafted into the army, not only unusual demands but unusual conditions have been imposed. Some of the countries have in the past been more largely self-sustaining than others, but all have felt the necessity of extreme measures to make them increasingly reliant on their own food production, either by reason of blockade or of economic policy.

The first efforts in the various countries centered largely on providing the machinery for gathering in and saving the crops, but as time has gone on the necessity has become apparent of providing for the continuance of agriculture on the highest possible plane,—of maintaining the fertility of the land, of preventing the depletion of live stock, of avoiding waste of all kinds, and often of discovering and utilizing new sources of supplies. To accomplish these ends organization has been greatly extended, and in many cases unusual powers have been conferred.

The force of the situation is illustrated by the fact that in 1915, when the wheat crop of Great Britain was the largest for many years, three-fourths of the wheat supply of the country had to be imported. In that year the United Kingdom imported agricultural products valued at \$1,342,000,000 and France imported food prod-

ucts worth \$492,000,000. In Great Britain two-thirds of the total area of cultivated land was in permanent grass, prior to the outbreak of the war, and only one-third in cultivated crops, whereas in Germany the proportion was exactly reversed. Moreover, agriculture in Great Britain was on a less efficient basis than that of Germany, as the president of the Board of Agriculture pointed out in an address the past summer, in the course of which he declared that if agriculture had made no more progress in Germany than it had in the United Kingdom during the 20 years preceding the war, the German Empire would have been at the end of its food resources long before the second year of the war. He explained further that the war was being fought by Germany quite as much on an agricultural as on a military organization of the nation.

To overcome its disadvantage in cultivated land and to provide land and labor for food production, the most urgent appeals have been made in Great Britain and numerous measures adopted to readjust the systems of farming. War agricultural committees and borough war food societies have sought to bring assistance to the farmers in the matter of information, labor, seed, fertilizers, etc., and to secure additional land for allotment to small farmers. Attention has been turned to the cultivation of land not ordinarily employed in agriculture, to the breaking up of grass land and pastures, the cultivation of parks and pleasure grounds, the employment of waste woodland for raising pigs, etc.; and farmers have been urged to shorten the period of grass and clover in rotations, and to reduce the acreage of bare fallow.

In England and Wales the area of arable land was increased in the crop year of 1916 by something over 85,000 acres, largely through the breaking up of permanent sod, but there was harvested in that year over a quarter of a million acres less of wheat than in 1915, with a consequent decrease in the production of that cereal. Great pressure has continued to be brought to bear on farmers to extend the raising of wheat.

Similarly in Germany the need for the largest possible production of food has been impressed upon the people and effective measures provided to accomplish that end. The thorough cultivation has been urged of every available piece of land on farms and in towns, and societies have been formed to take the work in hand and see that it is carried out. The crops for which there was most need have been indicated, and the whole question of production has been systematized. During the year an Imperial Office for Vegetables and Fruit was established to further the production and preservation of fruit and vegetables, with power to provide for the growth of the necessary amount of these supplies and their preservation. The authorities took over the fruit crop of the entire country for making jams and preserves for the army.

In France, organization has been carried to a high degree. Agricultural committees have been formed in each commune, which not only form a part of the government's plan for mobilizing agricultural labor, but are also responsible for the cultivation of farms or holdings which have fallen out of use, with power to commandeer such land, and are active in the supply of seeds, fertilizers, and other necessities for farming. In the districts of France that have been invaded,

the needs of the peasants for horses, implements, seeds, fertilizers, forage, etc., were supplied in part by gifts and in part by governmental loans made through the credit banks. Steps were taken to increase the amount of gardening carried on, by putting the opportunity for cultivating gardens within the reach of even the humblest; and school masters were employed to instruct the children in gardening and to carry on model gardens.

In Great Britain, also, the attention of the elementary schools was called to ways in which they could increase the food supply by gardening, collecting wild fruits, raising poultry, rabbits, pigs, bees, etc., and by canning and making preserves.

A provisional law in Turkey, enacted during the summer, authorized a special appropriation of nearly \$2,000,000 to be used for purchasing seed grains for poor farmers.

The Royal Agricultural Society of England last year organized a fund for the agricultural relief of the Entente Allies in the regions devastated by war, and distributed through the French government live stock, agricultural implements and machinery, and considerable amounts of seed.

There has been a widespread effort to prevent the depletion of the live stock of the warring countries, especially the work animals, milch cows, and breeding stock. In view of a tendency in Great Britain to dispose of cows on account of existing and anticipated shortage of labor, or owing to the reduced allowance of petrol for running milking machines, the Board of Agriculture has made every effort to help dairymen to retain indispensable laborers and has urged the training of women for milking. Statistics collected in June, 1916, showed that the live stock in England and Wales had not only been maintained but that a larger number of cattle were on hand than at any recorded date in history.

In Germany an order has been issued, to take effect in the spring of 1917, forbidding wild game to be fed with fodder which is adapted to feeding cattle, a measure which has aroused much opposition from those interested in game preserves.

The high price and scarcity of copper have led to efforts to secure substitutes for copper salts in fungicides for spraying. In France unusually heavy losses were sustained from black rot in the vineyards, because of inability to spray as much as usual. The hot water method has been reverted to in treating seed for smut, and lime-sulphur spray is being given wider use. Everywhere special stress has been laid on the control of diseases and other injuries of standard crops, like cereals, potatoes, and beets, to protect the food supply; and efforts have been made to prevent losses due to wild animals, birds, etc., which feed on farm and garden crops, by the killing off of these animals. The planting of good seed which will yield large returns has also received attention, and special provision has been made to provide such supplies. In Germany there has been much activity in the fixation of nitrogen from the air, for general uses and for fertilizers, some marked advances having been made in the direction of efficiency and economy. Small beets, apple culls, beet residues, etc. are being employed in alcohol making, and many studies are reported on vegetable sources of oil.

The testing of farm machinery has been given special impetus by the shortage of labor, and in some sections coöperative farm implement societies have been formed to provide funds for their purchase or coöperative ownership. Of late, however, some difficulty has been experienced in securing the allotment of petrol for their operation. It was announced during the summer that the Italian government contemplated extensive purchases of labor-saving agricultural machines to meet the difficulty caused by lack of farm hands, a new experience in that country. The purchase of tractors and power machinery has also been encouraged in France by grants from the government and from one of the railway systems.

**AGRICULTURAL LABOR IN EUROPE.** The greatest difficulty in maintaining agriculture has centered in the labor problem. This has been felt in all the warring countries and has been a subject of special consideration. Soldiers and reservists have been employed to an increasing extent, army regulations being made increasingly favorable to this, and civilians have been exempted in order that they might render war service in the field of agriculture.

In August the British Army Council decided to release some 27,000 soldiers to assist with the harvest, these to be allotted to the various districts on application of farmers through the local labor exchanges. Instructions were also issued that as far as possible there should be loaned to farmers draft horses, mules, and drivers for help in harvesting in the neighborhood, payment to be made at fixed rates. In October, the Council decided to suspend the calling out of men employed in agriculture until April, in case they were needed to maintain milk production, except as substitutes were provided from men serving in the reserve. A labor scale has been established, having reference to the labor which should be left on farms to insure a reasonable standard of cultivation, and a census of male and female workers employed on agricultural holdings was taken by the War Office in November. The difficult situation with respect to labor was succinctly set forth by the president of the Board of Agriculture toward the close of the year in the statement that "The nation must have more food, agriculture requires more labor, and the army claims more men."

During the year a volunteer movement was started in England to provide harvest labor, which resulted in the registration of school masters, school boys, clerks, and men over military age.

France also exercised increasing liberality in allowing unoccupied soldiers to work on the land, volunteers being called for from among those accustomed to manual labor. The right of mobilized farmers to receive such permission to labor at opportune times was recognized, and in order to avoid unfavorable reflection upon such, the idea was widely disseminated that soldiers thus volunteering to assist in farm work were not to be regarded as "shirkers" but men doing a double patriotic duty. The matter of supplying soldier labor has been systematized, the agricultural committees of the communities ascertaining the labor needed and making application to the general commanding the district. A French commission on agricultural labor, appointed in 1915, listed French and Belgian refugees for employment, and made efforts to recruit

agricultural labor from other countries, notably Spain.

Germany devoted special attention the past year to the harvesting of crops. In many cases public work of all kinds was interrupted in order to set free labor for the farms. Unusual labor, especially that of women, was applied on a large scale, the help of school children was enlisted in gathering the potato crop, and furloughs were extensively granted by the military authorities.

The employment of prisoners of war has also increased. This was at first unpopular, especially in France and Great Britain, but such satisfactory results were secured and the prisoners were found so submissive that the practice has spread widely. Employers are required to pay prisoners wages, in England the same rate as to English laborers. Prisoners have been organized into large companies, with those suited to particular kinds of work grouped together, and have traversed the different districts of the country at the time needed.

But in spite of these provisions, women have been the chief source of new labor, and high tribute has been paid to the way in which they have met the call upon them. This service has not been confined to peasant women and those accustomed to work in the fields, but has included many who had not done such work before the war. What the French women especially have done in taking the place of the men has been extolled in reports brought back by visitors to that country. In the appeals to them it has been explained that no work is inferior at such a time, but that everything is great which is of service to the country.

Early in the year the British Board of Trade, in conjunction with the Board of Agriculture, took active steps to mobilize a large supply of women for farm labor. Stirring appeals were made to all women to train themselves to take a man's place, to work a part of every day if they could not give their whole time, to cultivate their own gardens and allotments thoroughly, to keep pigs and poultry, and to see that there was no waste of fruit or vegetables.

Women organizers were placed in the field, county farm labor committees were established, and a scheme of systematic propaganda was carried on in all parts of the country, even extending to a house to house canvass. Later the Woman's National Land Service Corps was formed to assist the women's farm labor committees and to take part in the national campaign. To meet the need for training of women volunteers, a large number of counties made provision for instruction of women and children in light farm work. In some sections crèches to care for the children during the day have been found necessary to release the mothers, and a movement for day nurseries was started. A costume for women laborers was designed and placed on sale by the Board of Agriculture; and in recognition of the patriotic spirit of such women workers the same agency issued certificates "emblazoned with the royal arms and colors," and an armet to those who actually performed 30 days of such work.

In sections where women's work was unknown, farmers were often skeptical as to the possibility of securing help from them and as to the value of their services on the land. To convince farmers of their fitness and their willingness, agricul-

tural demonstrations by women were held in many sections, with a considerable number of entries for such competitions as plowing, handling teams, and even shearing sheep. Not only women of the industrial but of the educated classes have taken up this service. The results are reported as having been very satisfactory and affording a considerable measure of relief.

AGRICULTURE AFTER THE WAR. Already attention is being directed to this subject and to the placing of disabled soldiers on the land. A committee in Great Britain has rendered a report on the employment of ex-service men in farming after the war. Of the large number of men taken from farm work, it is expected that only about one-fourth will be able to return to it, which will result in a considerable shortage of agricultural labor. This indicates the need of attempting to settle on the land ex-service men not previously employed in farm work, and some of the millions who will be thrown out of employment after the war. As a beginning, the Board of Agriculture has already announced that an estate of 2363 acres of land has been acquired in Yorkshire for a land settlement colony of ex-service men. The colony will consist of a central farm of about 200 acres and a large number of small holdings for mixed farming. Applicants will receive preliminary training on the central farm where necessary, and be paid wages until such time as they are capable of working a holding independently. Coöperation will be followed in the purchase of supplies and the consignment and disposal of produce. Much interest is felt in this experiment.

In British Columbia a soldier's homestead act has been passed providing a free grant of land and a loan of money for improvements, with exemptions from taxes except for school purposes and five years' exemption from seizure for debt. Courses of instruction are being arranged for such settlers, and the government is making special allowance for the maintenance of the men and their families while this is being taken. Favorable conditions for the acquisition of land by returned soldiers were also made in New Brunswick.

In South Australia an act has also been put into effect providing for the settlement of returned soldiers on crown lands set aside for the purpose, the land to be leased perpetually or for a term of years. Provision is made for financial aid to such settlers in preparing the land, erecting buildings, purchasing implements, live stock, etc., interest on such loans and also the rent to be wholly or partly remitted in cases of hardship.

In the past year the various sections of the British Association for the Advancement of Science were asked to give consideration to the means of meeting problems which will arise after the conclusion of the war. In accordance with this request, the president of the Section of Botany dealt in his address largely with the economic and applied aspects of that science, and the president of the Section of Agriculture dealt with The Possibilities and Prospects of Increased Crop Production. Special attention was given to a consideration of the means of increasing the yield per acre and the certainty of production, and of reducing the cost per acre. He also referred to the need of agricultural education, to raise the ordinary farmer to the level of the good one, to the extension of the area of land under cultiva-

tion by the reclamation of waste, and to the substitution of arable crops for grass.

The former director of the Rothamsted Experiment Station in England, Mr. A. D. Hall, has issued a book entitled *Agriculture After the War*, in which he presents his views of the methods to be adopted in order to develop agriculture to the full extent demanded by the national needs. He insists that more food must be grown at home as an insurance in time of war, to develop the home resources and reduce foreign indebtedness, and to increase the agricultural population as an exceptionally valuable element in the community. This can be accomplished only by bringing more land under the plow. On their own responsibility farmers will not plow up grass land to put in crops involving greater risk, and Mr. Hall suggests that the state may be driven to adopt some system of bounties or protective duties to make the profits from arable farming more certain and the inducements more tangible.

**BRITISH AND GERMAN AGRICULTURE.** Perhaps nothing better illustrates the full realization of the seriousness of Great Britain's agricultural policy, in the present supreme test, than the publication by the Board of Agriculture during the year of a pamphlet entitled *The Recent Development of German Agriculture*, by Mr. T. H. Middleton, assistant secretary of the Board. This represents a frank attempt to explain why it is that in recent years German agriculture has made such a rapid advance while in England the production of food from the soil has decreased. Mr. Middleton shows that the ascendancy of the German over the Briton in agriculture has been gained in the past 40 years. The soil and the climate of Germany are both less favorable to agriculture than those of Great Britain, but the German farmer employs his land to better advantage in producing food crops, with the result that he feeds from 70 to 75 persons per 100 acres of cultivated land, whereas the British farmer feeds from 45 to 50. The reason for this striking difference is found in part in the fact that in Germany less than one-third of the cultivated land is in grass, while in Britain more than two-thirds of the cultivated land is used for that purpose. While there has been a slight decrease in the area annually plowed in Germany, in England and Wales the plowed area decreased by about 26 per cent in the 40 years before the war. A further immediate cause of higher production is the intelligent and efficient use of fertilizers, promoted by a well-organized system of agricultural instruction, the amounts of nitrogen, phosphate, and potash used being several times as large as on an equal area of cultivated land in Great Britain. It is admitted also that the soil has been better cultivated, plants and animals have been improved in type, and sanitary laws have led to a great improvement in the health of live stock.

Furthermore, much significance is attached to the fact that the German economic policy has favored agriculture—the growing of food as a measure for the common good of the country, while Great Britain's policy has been to import it. Germany's plan for safeguarding and encouraging agriculture has been far-reaching, including a splendid system of agricultural instruction and investigation, the provision of agencies for leadership, better business methods, and the employment of the profits of agriculture in further developing the means of production.

The necessity for agricultural instruction and experimentation is emphasized, and the conclusion is reached that for the increase of home-grown food supplies capital and labor are essential, and that "without security for capital and security of labor the extension of arable farming is not possible."

**FARM CREDIT.** For details of the important Federal Farm Loan Act, of July 17, 1916, see the article **AGRICULTURAL CREDIT**.

An agricultural credit act, passed in British Columbia in 1915, became effective in April, 1916. Agricultural bonds to the amount of \$1,000,000 were disposed of by the provincial government, making available a fund for immediate loans to farmers. Another sale of farm loan bonds is planned. It is expected that the new law will stimulate agriculture in the Province.

**GRAIN STANDARDIZATION.** To enable the grower to sell his grain on its merit and to afford greater security in buying and selling, a Grain Standards Act was passed by the U. S. Congress in the summer of 1916. The act authorizes the Department of Agriculture to establish official standards, to license grain inspectors for grading shipments in interstate and foreign commerce, and to act as referee in disputed cases. The standards fixed by the Department will supersede all previous standards, and no interstate or foreign shipment can be made by grade except subject to grading and certification by inspectors. Sales by sample, type, brand, or trade name are, however, allowed as in the past. These inspectors are not government employees but are licensed and supervised by the Department; and penalties for false grading are provided. In order to provide for the supervision and appeals under the law, the Department has divided the country into 32 districts, in each of which there will be an office of Federal grain supervision, usually in charge of a supervisor or board. Official standards have been issued for corn, consisting of six grades each for white, yellow, and mixed corn, and also a sample grade. Standards for wheat and oats are in process of determination, and studies are under way for ascertaining the basis for standards for other grains, including the grain sorghums.

**GUAYULE.** Rapid-growing strains of this shrub of high rubber content have been produced from wild plants in Arizona, and are now being developed as a commercial source of rubber. A large plantation was established the past season near Tucson, Arizona, by one of the leading rubber companies, and an expert placed in charge. Although employed to some extent in Mexico, this is the first attempt to cultivate and use the guayule commercially in the United States.

**MEETINGS AND ORGANIZATIONS.** The Second Pan-American Scientific Congress, at Washington, D. C., Dec. 27, 1915, to Jan. 8, 1916, devoted much attention to matters of agricultural interest and adopted important resolutions relating to agriculture and forestry.

At the Columbus meeting of the American Association for the Advancement of Science, at the close of 1915, the Section of Agriculture presented a programme on "The Relation of Science to Meat Production." The same Section at the New York meeting of the Association, at the close of 1916, held a symposium on "The Adjustment of Science to Practice in Agriculture," and the address of the retiring Vice-President,

financial prosperity. Among the most important events have been adoption of prohibition and of a general eight-hour law, the construction of railways—governmental and private, the institution of Federal land surveys, and the enormous increase both in the amount and value of the copper output. Gold-mining continued to be productive, fisheries flourished, and the forests began to remunerate. As a whole the condition of the natives improved steadily though slowly. Through separate reservations, Federal schools, vocational training, reindeer breeding, admission as citizens, village councils, sanitary improvements, and self-governing villages, the natives have risen in the social scale and in civic usefulness.

**POPULATION AND TOWNS.** The Governor, J. F. A. Strong, estimated the population in 1916 at 75,000, of whom 25,000 were natives. Twelve of the 16 incorporated towns made assessments in 1916, the values aggregating \$14,656,697. The assessments and tax rates were as follows: Cordova, \$909,465, tax per cent .05; Douglas, \$566,933, 1.0; Fairbanks, \$2,856,903, 1.5; Juneau, \$3,547,400, 2.0; Ketchikan, \$1,172,750, 1.5; Nome, \$1,531,359, 2.0; Petersburg, \$250,250, 1.0; Seward, \$1,716,927, 2.0; Skagway, \$606,917, 1.0; Tanana, \$500,000, no tax; Valdez, \$795,572, 2.0; Wrangell, \$202,161, 2.0. The new town of Anchorage, at the mouth of Ship Creek, Cook Inlet, is of considerable size and already provided with plants for railway work, schools, banks, etc., but it is not yet incorporated. A townsite, called Nenana, has also been laid out at the junction of the Tanana and Nenana rivers.

**LAWS.** As Congress authorized biennial sessions only, the Alaskan Legislature did not convene in 1916. In 1915 a law was enacted for passing at the general election of November, 1916, on labor and liquor questions, through the popular vote. By a large majority it was voted that after Jan. 1, 1918, spiritous liquors should not be manufactured, sold, transferred, or given in the Territory, and by a very large majority the provisions of the eight-hour day law were made general for all wage and salary earners. Under the provisions of the act the Legislature in its session, commencing in March, 1917, must pass acts necessary to carry out the wishes of the electors.

**TERRITORIAL BANKS.** All banks must be either national or territorial. There are three national banks, located at Juneau, Fairbanks, and Seward. Under recent legislation private banks have been abolished, and in their stead are 14 territorial banks, four having been organized during 1916. They are at Anchorage (two banks), Cordova, Douglas, Fairbanks, Iditarod, Juneau, Ketchikan, Nome, Petersburg, Seward, Skagway, Valdez, and Wrangell.

**MINERAL PRODUCTION.** Data as to the record-breaking productivity of the mines of Alaska during 1916, have been drawn, as usual, from the preliminary report, dated Jan. 1, 1917, of Mr. Alfred H. Brooks, Chief of the Alaskan Division, United States Geological Survey. It is believed that the values thus obtained will not vary over 4 per cent from the final revision, as in 1915 they were an underestimate of less than 3 per cent. As will be noted, the increase in values during the year 1916 far exceeds that of any previous year, yet the maximum increase in percentages is less than that of 1915. The total production in recent years was: 1914, \$19,065,-

666; 1915, \$32,854,000, an increase of 77 per cent; 1916, \$50,900,000, an increase of 65 per cent. Though the enormous rise of values for 1916 was mostly due to the large tonnage and unprecedented increase in the price of copper, yet practically all the other minerals were mined in greater quantities than ever before. While it is to be anticipated that the price of copper will materially decrease, yet developments of new deposits of copper and of gold will largely increase the output in a few years, and so ensure a continuous, healthy growth of the Alaskan mining industries. As copper has displaced gold as the most productive mineral of the Territory, so in due time it is possible that coal may displace copper, in value if not in importance.

A notable increase in mineral values was that of silver—largely due to the immense amount of copper ores—from \$543,393 in 1915 to \$950,000 in 1916. The value of the less productive Alaskan minerals in 1915 and 1916, respectively, was as follows: tin, 1915, \$78,846, 1916, \$120,000; lead, \$41,118 and \$110,000; antimony, \$74,000 and \$60,000; tungsten, none and \$60,000; coal, \$3300 and \$30,000; gypsum, petroleum, marble, etc., \$272,299 and \$130,000.

The total mineral output of Alaska in its 32 years of mining has exceeded \$352,000,000 in value, distributed as follows: gold, \$277,909,943; copper, \$67,319,581; silver, \$3,774,911; antimony, lead, petroleum, tin, etc., \$3,184,111.

**Gold Mining.** The gold production of 1916 was valued at \$17,050,000, the increase having been continuous for three years, the amounts being in 1913, \$15,626,813; 1914, \$15,764,259; and 1915, \$16,702,144. About 4600 men were engaged in the placer diggings, which numbered 640 during 1916. Their output was \$10,640,000 against \$10,480,000 in 1915, and \$10,730,000 in 1914. The placers in recent years have produced the following percentages of the total output: 1912, 71 per cent; 1913, 68.4; 1914, 68; 1915, 62; and 1916, 62 per cent. These percentages indicate the trend of the mining industry. The 25 gold-lode mines operated in 1916 produced \$6,200,000, against \$6,069,000 from 28 mines in 1915. The only important centres of quartz-mining are in Southeastern Alaska, especially in the Juneau district. The lodes of the Fairbanks district await the completion of the railroad, which will bring cheaper fuel. The Treadwell and the Alaska Gastineau mills are the great lode-producers. As usual the largest amount of gold was mined in the Yukon Basin,—almost entirely from placers—in the principal districts as follows: Iditarod, \$2,000,000; Fairbanks, \$1,800,000; Ruby, \$800,000; Hot Springs, \$750,000; Tolovana, \$500,000; Marshall, \$400,000; Koyukuk, \$300,000; and Circle, \$250,000. The important new gold camps are Tolovana, 50 miles northwest of Fairbanks, and Marshall, on the Yukon not far from the delta. The total Alaskan gold output, aggregating to Jan. 1, 1916, \$260,858,943, was mined by districts as follows: Pacific Coast Belt, \$76,529,291; Copper River and Cook Inlet Region, \$46,613,783; Seward Peninsula and Northwestern Alaska, \$71,562,700; Yukon Basin, \$106,423,169. In 1916 the districts in order named produced \$5,960,000; \$1,090,000; \$2,900,000; and \$7,100,000. Up to the present time, 1916, gold has been largely obtained from placers, which have yielded \$186,192,943, while \$73,558,184 has come from the silicious ores, and \$1,107,787 from cop-

per ores. Silver was mined from placers to the value of \$567,835; silicious ores yielded \$658,843, and copper ores, \$1,295,233.

**Coal Mining.** The coal-bearing rocks of Alaska cover thousands of square miles, and the possible production of good coal, much of high order, runs into hundreds of millions of tons. Yet in the 16 years, 1899-1915, there were imported into the Territory 1,750,814 tons, while only 40,369 tons were mined in Alaska. Fortunately the Federal law of December, 1914, renders practicable the mining of coal in the Territory. The principal coal-fields are those of Bering River, Matanuska, and Nenana. They are now open to the public through the completion in 1916 of the detailed surveys, the classification thereof, and the designation of the sections reserved for governmental use. Six applications for leasing privileges have been made and are under consideration. Mining privileges, covering areas of not over 10 acres, have been made free of cost and are being utilized for industrial and domestic purposes, at 15 points. From the Moose Creek mine, in the Matanuska Valley, shipments were made for use on the government railway, while the mine at Bluff Point, Cook Inlet, has supplied the neighboring local markets; in all about 5000 tons have been mined.

**COMMERCE.** Current prosperity in Alaska is reflected in its greatly increased commerce. The volume of merchandise shipments, including minerals, aggregated for the fiscal year 1915 \$71,352,276, which increased in 1916 to \$97,340,420, an advance of 36 per cent. Yet more striking are the shipments for 10 months,—January to October, for 1915 and 1916. Total shipments to the Territory, 1915, \$20,874,231; 1916, \$28,404,993, an increase of 41 per cent. Shipments from Alaska, including all minerals, 1915, \$41,003,254; 1916, \$66,341,096, an increase of 61 per cent.

**FUR SEALS.** The North Pacific Pelagic Sealing Convention of July 7, 1911, remains in force, and is strictly observed. Sealing on the Pribilof Islands is still prohibited, the closed season terminating according to existing law on Aug. 24, 1917. The increase of the herd has been satisfactory, the censuses showing the following numbers: 1914, 294,700; 1915, 363,877; and 1916, 417,329, of which 116,977 are breeding cows. There were slaughtered for the use of the natives of the Pribilofs 3947 seals in 1915 and 5392 in 1916. To conserve the interests of the United States, Secretary of Commerce Redfield by restrictions on the sale of fur-seal skins brought about the establishment of a dressing and dyeing plant, a novel American industry. At St. Louis, on Sept. 20, 1916, 1900 such dyed seal skins were sold at remunerative prices. Through improved administration the 314 natives of the Pribilofs are said to be better educated, fed, and housed than any other community of natives in the Territory.

**FOX-FARMING.** No additional islands have been leased for fox breeding. The leases expire in 1919 on the following islands: Carlson, Little Koniuji, Middleton, and Simeonof. Other fox farms exist in Southeastern Alaska, in the Kodiak-Afognak and Copper Centre regions, along the Tanana and Yukon rivers, and in the Aleutian chain. Not including the Pribilofs there were shipped out of the Territory in 1915 fox-pelts as follows: black, 8; blue, 382; cross, 1360; red, 11,770; silver-gray, 187; and white,

5967; total valued at \$238,401. From the Pribilofs fur-pelts came as follows: 1914, 256 blue, 25 white; 1915, 253 blue, 40 white; 1916, 420 blue, 20 white. Pelts are lower than in 1915, the average value of silver-gray being in 1916, \$150, and of black pelts, \$400.

**MINOR FUR-BEARING ANIMALS.** Excluding foxes the value of the pelts in 1915 was \$162,131. The principal skins were 782 bear, 9374 lynx, 3028 marten, 980 land otter, and 23,079 minx. To prevent extinction the killing of marten was forbidden until Nov. 15, 1921.

**REINDEER INDUSTRY.** Year by year the breeding of reindeer is extending its field and increasing its benefits for the natives of Alaska. In 1916 the first attempt was made to introduce the deer into Southeastern Alaska, eight deer being sent to Metlakatla. The last available census was made on June 30, 1915, when there were 70,243 animals in 76 herds. This was an increase over 1914 of 12,461 head, not including 9000 which had been slaughtered for food and skins. As the annual increment exceeds 21 per cent, the aggregate number in 1916 approximates 85,000. Two-thirds of the deer, 48,683 head, are owned by 1140 natives. Lapps and other whites own 1362, the missions 6890, and the United States retained 3408. The largest herds are at or near Bethel, in the Kuskokwim Valley, where there are more than 11,000 deer. A convention of deer breeders was held in 1916 at Igloo, Seward Peninsula, with great benefit to the assembled natives, who exchanged views as to the best methods of driving, training, slaughtering, etc. Besides the food, skins, etc., obtained for their domestic use, the natives had an income of \$81,997 from the sale of meat, hides, etc.

The deer problem assumes a new phase through its diversion, in part, to commercial purposes. A corporation has purchased some 2000 animals from the Lapps and from a mission. This looks to the introduction of deer meat generally. While the surplus male deer are available for food, any further inroads seem injurious to the interests of the natives, for whom the United States imported the deer.

**NATIVES.** Classified as Indians, the natives of Alaska numbered 25,331 in 1910; in the aggregate no material change has since occurred. In health, intelligence, and material prosperity the Indians of Southeastern Alaska stand first. The fisheries gave employment in 1916 to about 5000 natives. Some natives have registered as citizens under a recent Territorial law. There is a growing tendency among them to segregation on reservations and in self-governing villages, where opportunities of improvement are greater. In most villages there are councils of the best natives, who shape public opinion and control politics. Coöperative stores have been operated with benefit at Atka, Hydaburg, Klawock, Klukwan, and St. Lawrence Island. During 1916 reservations were established for the natives at Tyonek, Cook Inlet, and at Noorvik, in the Kobuk Valley, making a total of 11. Hospitals for the sick are maintained at Kotzebue, Kanakanak, and Nulato, while under contracts natives are admitted to hospitals in Candle, Juneau, Nome, Seattle, and Valdez. Under Superintendent W. T. Lopp, United States Bureau of Education, there were maintained during 1916 69 schools, with an enrollment of 3436 pupils and an average attendance of 1963. These schools, excellent as a rule, teach domestic

and industrial methods,—cooking, sewing, canning, etc., to the girls; carpentry, gardening, etc., to the boys. Medical aid is provided to some extent, principally in sanitation, segregation in epidemics, etc. Despite inadequate equipment, isolation in service, and insufficiency of personnel, it is evident that the doctors and teachers have largely contributed to the uplift and advancement of the natives of the Territory.

**SURVEYS.** The United States Geological Survey continued its valuable work, which has covered nearly every area of economic importance in the Territory. To include 1915 its geologic surveys covered 29 per cent of total areas, and its topographic work 33 per cent. In 1916 its surveys covered 21,312 square miles, 10,900 being geologic. The Coast and Geodetic Survey, by its steamer *Yukon*, has explored the delta and the upper reaches of the Kuskokwim River above Bethel. Sea-going ships can now reach Bethel, and river-boats reach McGrath 500 miles further up-stream; this increases to 1200 miles the navigable waters of this valley. Certain stretches of the Kuskokwim had been erroneously charted, some points being as much as 50 miles in error. The Coast Survey also continued work on the Inside Passage, where its system of wire-dragging disclosed pinnacle rocks and other menaces to safe navigation.

**TELEGRAPHS.** The United States Signal Corps system connects Seattle with nearly every place of importance, reaching Nome in the northwest and Eagle in the northeast. It operates 2627 miles of submarine cables with 19 stations, 848 miles of land-lines with 29 stations, and routes of 3721 radio-service with 10 stations. The rates were again reduced Oct. 1, 1916, from 15 to 50 per cent. The Pribilofs and Cordova are served by the radio system of the navy. Private telephones connect Nome with Kotzebue Sound, and Fairbanks with adjacent mining camps.

**AIDS TO NAVIGATION.** During 1916 the Light House Board established 35 lights, 5 beacons, and 18 buoys. Its most important work has been the completion of the much-needed lighthouse at Cape St. Elias, on Kayak Island. The United States Coast Survey has continued its wire-drag surveys through the Inside passage, discovering many perilous pinnacle rocks.

**HOMESTEADS AND TOWNSITES.** In connection with the construction of the governmental railway, the United States Land Office has surveyed three townships—an area of 354,165 acres. Townsites have been opened in the Cook Inlet region at Anchorage and Wassalia, and in the Tanana Valley at Nenana. Homestead entries have largely increased in the same sections, though the great cost of surveys—which in Alaska alone devolve on the settler—deters entries. The Congressional Act of July 8, 1916, permits entries up to 160 acres, except on reservations and leased fox-farms.

**AGRICULTURE.** The Alaska Agricultural Experiment work has continued along lines calculated to develop grains, vegetables, fruits, and stock suited to the soil and climate. The crops of hay and vegetables steadily increase. Holstein cattle have been taken to Kodiak for crossing with the Galloways, and the introduction of the Siberian yak is suggested. Farms and gardens have increased their output in the Tanana Valley and in the Southeastern Archipelago. Stimulated by the railway construction large numbers of farms, 400 it is said, have been

opened in the region to the north of Cook Inlet.

**RAILROADS.** Far the most important event in Alaskan affairs is the construction of a railway by the United States, which has rapidly advanced during 1916. The Alaskan Northern Railway, extending 71 miles from Seward northward on Kenai Peninsula, has been rebuilt, and work is under way to connect this section with the main line on Knik Arm. To facilitate the opening of the coal district in the Matanuska Valley, original work of construction was begun at Anchorage, at the mouth of Ship Creek, Cook Inlet. Here a complete railway town was built. It has dock and lighterage facilities, repair, round, and machine shops, ware and employee houses, waterworks, telephones, banks, mess halls, etc. The railway was rapidly completed to Moose Creek, Matanuska Valley, via Matanuska Junction, and daily service began in August, 1916. In October 63 miles were operated, and 49 graded. It is planned to have 112 miles of the main line in service by May, 1917. Work was also commenced at the northern terminus, in the Tanana Valley, between Fairbanks and the mouth of the Nenana River, where the townsite of Nenana had been surveyed, and administration facilities organized.

Private capital has graded a railroad of 15 miles, between Katalla, Controller Bay, and a patented coal mine in the Bering River field. Its equipment and transportation of coal is promised for 1917. For the past few years the railroad on Seward Peninsula, from Shelton, has not been used. The Yakutat Southern refuses public business, but the other roads are being operated.

**WAGON-ROADS AND TRAILS.** Even more important than railroads is the net-work of ordinary roads and trails. The Alaskan Military Road Commission has spent on roads during 1916 \$300,762; \$165,000 from a special appropriation by Congress, and the balance from the Alaska Fund. The construction during the year of 21 miles of wagon-roads and of 50 miles of sled-roads brings the system up to an aggregate of 922 wagon-roads, 627 sled-roads, and 2210 trails, a total of 3759 miles. Repairs of fresh-damages, etc., make large inroads on the funds.

**FISHERIES.** The year 1916 was one of unprecedented prosperity in Alaskan fisheries. Although complete data are wanting, yet the shipments for 10 months ending with October show an increase of \$4,000,000 over any preceding year; the shipments aggregated, 1914, \$17,125,672; 1915, \$15,573,542; 1916, \$21,281,322. This increase was due in part to higher prices, but largely to the output, which as regards salmon—over 90 per cent of all—was larger by 47,455,000 pounds than in 1915. The latest complete data are for 1915, when the values, despite low prices, were \$20,999,343, distributed as follows: salmon, \$19,214,145; halibut, \$802,011; cod, \$300,199; whale, \$381,750; herring, \$155,579; miscellaneous, \$55,659. The capital invested was \$37,316,560, and the employees numbered 22,462. The halibut industry steadily increases, the values exceeding by \$14,300 those of the preceding year, besides large catches which do not appear in the Alaskan reports. The opening of the Grank Trunk Railroad to Prince Rupert, within 90 miles of Ketchikan, threatens some diversion of the American trade. In the cod fishery there were decreases in investment and in

product. The increase in herring values, \$432,000, was due to herring pickled for food. Only two whaling stations are operated, at Port Armstrong and at Akutan, which produced \$90,000 more than the year previous. Seventy-nine licenses were issued for commercial fishing, as required by law.

The salmon industry produces over 90 per cent of values. In 1915 there were 85 canneries, 45 in Southeastern, 17 in Central, and 23 in Western Alaska. The investment exceeds \$32,000,000 and the employees numbered 22,462. There was an enormous increase in the catch of humpbacks, or pinks, about 14,200,000, a decrease of 3,950,000 in red or sockeye salmon, and of 1,450,000 in chums or keta. While the catch of 1915 exceeded that of 1914 by 443,640 cases, of 48 pounds each, the 1916 product will probably exceed 1915 by 200,000 cases. There were great increases in the shipment of frozen salmon, and of fresh fish packed in ice. In order to conserve the salmon industries, the Secretary of Commerce limited from Jan. 1, 1916, fishing in: (1) the tributaries of Barnes Lake; (2) Hetta Creek and its tributaries; (3) Sockeye Creek and its tributaries and Boca de Quadra.

**FORESTS.** The receipts from sales of timber from the Chugach and Tongass National Forests in 1916 were \$60,232, and the expenses of administration, \$41,206. Under free-use permits the Alaskan Engineering Commission cut timber to the value amount of 11,629,500 board feet. There were 365 timber sales of 45,868,440 board feet. Applications were made for 72 homesteads in Tongass and 120 in Chugach forest during the year. Trails and roads are under construction, paid for by 10 per cent of the receipts from sales.

**EDUCATION.** There are three separate school systems in Alaska,—for the children of the incorporated towns, maintained locally; for white children in the rural districts; and for the Indians by the United States. (See *Natives*.) The schools in the 16 towns educate about 1700 children. In the unorganized districts there were maintained in 1916 37 rural schools in which there were 50 teachers and 1470 pupils, with terms of nine months as a rule. The rural schools are supported by an allotment of 25 per cent of the Alaska Fund, which is formed from business and trade licenses outside of incorporated towns. The efficiency of the rural schools is seriously impaired, as the population is increasing and the fund decreasing, the receipts for 1916 being \$260,256 against \$260,257 in 1915.

**MISCELLANEOUS.** The Council of the Yukon Territory by official resolution favored coöperative action by the governments of Canada, British Columbia, and the United States for the international protection of game, and for the extermination of wolves and coyotes.

**ALBANIA.** Nominally an independent country, comprising the former Turkish vilayets of Scutari and Janina and parts of Kosovo and Monastir. The independence of the country was proclaimed at Valona Nov. 28, 1912, and on December 20th the principle of Albanian autonomy was agreed to by the London Ambassadorial Conference. On Feb. 23, 1914, the German prince-ling, William of Wied, accepted from an Albanian deputation the headship of the government, and on March 13th, at Durazzo, formally became Prince (Mpret) of Albania. Turbulent

conditions followed the outbreak of the great war, and in September, 1914, the Prince left the country. (See *EPHROS*.)

The provisional frontiers of Albania embraced an area of about 10,800 square miles, with about 850,000 inhabitants. The majority of the population are Mohammedan. The town of Scutari has an estimated population of 35,000; Elbasan, 13,000; Argyrocastron (now in Greek territory), 12,000; Valona, 6500; Durazzo, the provisional capital, 5000.

**HISTORY.** Austrians invaded Albania from the north in January and the Bulgarians invaded it from the east. The former took Scutari by storm toward the end of January and forced the Italians to evacuate Durazzo a month later. The Bulgarians at the same time entered the central part of the country, took Elbasar in February, threatened Avlona held by Italians and Albanians, and possessed themselves of the entire central part. Prince William of Wied, former mpret (prince), who had left the throne in 1914, now returned and in a proclamation appealed to the loyalty of the people. Essad Pasha, the former provisional Governor, having failed in his efforts to check the Austro-Bulgarian invasion and joined the Italians, went to Paris in April, where he was received with honor. In the summer (July) Italians still held Avlona and the Greeks held a part of the south. Later (October 6th) it was reported that Essad Pasha was in command of an Allied contingent in Albania, and that the Committee of Union and Progress in session at Constantinople had pronounced sentence of death upon him. (See *WAR OF THE NATIONS*.)

**ALBERTA.** One of the Northwest Provinces of the Dominion of Canada, east of British Columbia and west of Saskatchewan. The capital is Edmonton. Area, 255,285 square miles, of which 2360 water. Between 1901 and 1911 the population increased 413.08 per cent, or from 73,022 to 374,663; the increase per cent was exceeded only in Saskatchewan. Subsequent to the 1911 census the population continued to advance rapidly, large numbers of persons being attracted by Alberta's grain-growing lands, of which there are vast areas. The city of Calgary had in 1911 43,704 inhabitants; Edmonton, 24,900; Lethbridge, 8050; Medicine Hat, 5608. Of the population 10 years of age and over in 1911, males numbered 179,062 (62.47 per cent) and females 107,576 (37.53); of these, 149,687 males and 11,923 females were reported as employed in gainful occupations. Of the males employed, 53 per cent were in agriculture, and of the females 46 per cent in domestic and personal service.

The provincial government is administered by a lieutenant-governor, appointed by the Governor-General of the Dominion; he acts through an executive council, or responsible ministry, of eight members. The Legislative Assembly consists of one chamber of 56 members elected by direct vote for five years. In the twelfth Parliament, which convened in 1911, Alberta was represented by four senators and seven members of the House of Commons; the representation in the Commons on the basis of the 1911 census is 12. The Lieutenant-Governor in 1916 was Robert George Brett. The Premier in 1916 was A. L. Sifton.

**ALBRIGHT ART GALLERY.** See *PAINTING AND SCULPTURE*.

**ALCOHOL.** By far the most ambitious and thorough investigation into the effects of moderate doses of alcohol on the human organism is that undertaken in the Nutrition Laboratory of the Carnegie Institution at Washington, an institution ideally equipped for such research work. The investigation as thus far reported deals with the psychologic aspects of the subject, and this feature, studied by Dodge and Benedict, comprises the effects of alcohol on the cerebrospinal system from the simplest reflexes of the lumbar portion of the spinal cord to the most complex arcs in the brain. The subjects of the experiments were either college graduates who used alcohol in great moderation or patients who had been under treatment for alcoholism. The normal base lines in all cases included two normal experimental days for each subject and for each kind of experiment. One normal day came before and one after the experimental days when alcohol was administered. In addition a normal of the day was recorded for each experimental process on the day when alcohol was given. Two standard doses of alcohol were adopted, one containing about 30 c.c., the other 45 c.c. of absolute alcohol. The fundamental fact was brought out that alcohol is not a stimulant, but rather a depressant to all reflex activities, from the simple muscle reflex to speech reactions and visual word stimuli. The most striking effects were found in the reflexes. The latent time was increased in all cases. Memory and the free associations were only slightly affected. Sensitiveness to faradic stimulation decreased 14 per cent, after alcohol. The number of finger movements decreased 9 per cent, and the velocity of the eye movement decreased 11 per cent, as a consequence of the ingestion of alcohol. The acceleration of the pulse, usually regarded as the effect of stimulation, may be explained by the depressive effect of alcohol on the inhibitory centre. These scientific conclusions prove the force of Quensel's statement that work and alcohol do not belong together, especially when the work demands alertness, attention, exactness, and endurance.

Kruepelin, of Munich, recently reported the results of a shooting tournament held in 1908 by the Bavarian Ministry of War to determine the influence of alcohol upon marksmanship. Twenty carefully selected marksmen fired 27,000 shots in 16 days during the test. A single small dose of alcohol was found to cause inaccuracy of aim 5 minutes later, the most pronounced effect being noted 25 to 30 minutes later. The average loss in accuracy was 3.1 per cent; but in 11 men it was as high as 9, 10, and 12 per cent. All men were in prime physical condition. In war time, under consequent deteriorating conditions, the loss of accuracy would be much greater.

**ALEICHEM, SCHOLEM.** A Yiddish humorist, died in New York City, May 13, 1916. His real name was Solomon Rabinowitz, but it was by his pen-name (signifying "Peace be with you") that he was known to millions of Yiddish-speaking Jews. He was born in Kief, Russia, in 1859, and there he lived most of his life, writing for Russian Yiddish papers. In 1906, because of oppressions of the Jews, he came to the United States, and he had been living here since the beginning of the European war. When war was declared he was staying at a German health resort. Scholem Aleichem's arrival in New York in 1914 was celebrated by his

co-religionists by great receptions in Cooper Union and Carnegie Hall. His funeral was the occasion of a still more remarkable demonstration, and it was estimated that 100,000 persons stood to watch the funeral procession pass. Among his own people Scholem Aleichem held a position corresponding perhaps to that of Mark Twain among the English-speaking people.

**ALEXANDER, MOSES.** Elected Democratic Governor of Idaho, Nov. 7, 1916.

**ALFALFA.** Although alfalfa is widely grown in many countries north and south of the equator and constitutes one of the world's principal hay and forage crops, statistics regarding its acreage and production have never been more than fragmentary and at present, owing to conditions incident to the European war, are either nonexistent or unavailable. In the United States alfalfa has continued to increase in popularity and in many States it is now grown in every county. It is estimated that about 25 per cent of the tame hay and nearly 20 per cent or all the hay, tame and wild, now produced in the United States is alfalfa, and on this basis the production of alfalfa hay in 1916 was approximately 23,000,000 tons of 2000 pounds each. According to statistics published by the Department of Agriculture the average farm price of alfalfa hay on Sept. 15, 1916, was \$10.06 per ton, as against \$8.22 on Sept. 15, 1915. The high price of grain in the fall of 1916 brought larger quantities of alfalfa hay into use as a substitute in feeding, as protein purchased in this form was cheaper than that bought in grain.

The commercial production of alfalfa seed in the United States is confined to the region west of the 100th meridian where irrigation and dry-land farming are practiced. Under humid conditions seed production does not prove satisfactory, and work on this subject by the Iowa Experiment Station showed that the proper functioning of alfalfa pollen, which is the limiting factor in seed production, does not take place when moisture conditions are above a certain point. The average yield of alfalfa seed in the United States is about 3.5 bushels per acre, although individual yields of 15 bushels per acre representing a value of \$108 have been reported. Owing to war conditions largely, only about one-half as much seed was imported into the United States in the fiscal year 1915-16 as in each of the three preceding years. The average price of seed received by farmers on Sept. 15, 1916, was \$9.27 per bushel and the average price paid by them was \$11.30.

The question of making alfalfa silage has received attention because when used by itself alfalfa fails to make a good and palatable product. The Nebraska Experiment Station has found that a mixture of two parts of alfalfa and one part of saccharine sorghum makes a highly desirable silage and the method is recommended for saving the last crop of alfalfa when it cannot be made into hay. The Kansas Experiment Station succeeded in making good silage of finely cut fresh alfalfa and rye in the proportions of two parts of alfalfa to one of rye. See also *U. S. Department of Agriculture Farmers' Bulletin No. 741, The Alfalfa Weevil and Methods of Controlling It, and No. 757, Commercial Varieties of Alfalfa* (Washington, 1916).

**ALGERIA.** A country of northern Africa, sometimes called a colony, actually an integral part of the French Republic. Capital, Algiers.

The total area of Algeria proper is 207,739 square kilometers (Algiers, 54,540; Constantine, 87,302; Oran, 65,897); of the Southern Territories, 367,550 square kilometers—a total of 575,289 square kilometers. Total population of Algeria proper (1911), 5,069,522 (Algiers, 1,720,881; Constantine, 2,118,446; Oran, 1,230,195); of the Southern Territories, 494,306—a total of 5,563,828, of whom 795,522 Europeans and 4,768,306 natives. In 1912 there were 6493 European and 35,424 native marriages, 22,557 and 140,894 births, 12,957 and 82,147 deaths.

The principal towns are: Algiers, with (1911) 172,397 inhabitants; Oran, 123,086; Constantine, 65,173; Bône, 42,039; Tlemçen, 39,874; Blidah, 35,461; Tizi-Ouzou, 31,404; Sidi-bel-Abbès, 30,942; Philippeville, 27,370; Sétif, 26,261; Mascara, 24,254; Mostaganem, 23,166.

**PRODUCTION.** Agriculture is the leading industry. The population returned as engaged in agricultural pursuits in 1909 was 3,322,640, of whom 213,750 Europeans. No later statistics for wine culture were available in 1916 than those given in 1915, which figures are therefore repeated. The area under vines in 1910 was 152,100 hectares, yielding 8,414,000 hectolitres of wine; cereals, 3,001,000 hectares, yielding 22,147,000 metric quintals; roots, legumes, etc., 59,300 hectares, 1,319,000 quintals; forage plants and sown grass, 26,000 hectares, 822,000 quintals. Natural grasses covered 851,000 hectares, the harvest being estimated at 3,871,000 quintals. Olive trees number 6,655,000, yielding 3,364,000 quintals of olives and 351,000 hectolitres of oil. In the table below will be found the areas devoted to principal cereal crops for two years, with the total yield and the average yield per hectare (preliminary figures) for 1914-1915:

	Hectares		Quintals	Qa.
	1913-1914	1914-15	1914-15	aa.
Wheat .....	1,863,084	1,298,633	9,341,472	7.3
Barley .....	1,267,932	1,094,005	8,679,835	7.9
Oats .....	231,714	288,770	2,189,172	9.2

Cultivation is carried on along the coast regions and on the plains, while the mountainous north is largely devoted to grazing.

**COMMERCE AND COMMUNICATIONS.** The table below shows the special trade for comparative years, in thousands of francs:

	1911	1912	1913	1914
Imports .....	571,500	655,100	667,500	518,200
Exports .....	509,600	519,800	510,500	333,800

Official returns for principal articles of export in 1913 are shown below, together with figures for 1915 from a British source; value in thousands of francs:

	1913	1915	1913	1915
Wine ..	220,850	181,265	Phosphates	11,590 4,970
Cereals ..	51,637	52,905	Olive oil ..	11,010 6,689
Animals ..	37,576	41,440	Vegetables ..	9,956 .....
Fruits ..	17,303	12,878	Skins .....	8,761 8,112
Barley ..	16,360	7,728	Exports .....	8,164 .....
Tobacco ..	15,668	18,340	Potatoes .....	7,551 .....
Iron ore ..	14,710	10,980	Flours .....	6,811 .....
Zinc .....	12,674	2,620	Veg. oil .....	6,258 .....

\* Sheep.

The principal countries of origin and destination are France (450,350 thousand francs imports and 343,550 thousand francs exports in

1913), Belgium (1675 and 14,250), Great Britain (20,625 and 24,000), Spain (15,500 and 10,075), Brazil (14,025 and 100), United States (12,975 and 3225), Germany (7450 and 13,650), etc. Vessels entered (1912 trade), 5375, of 6,589,265 tons. Railways in operation Dec. 31, 1913, including Tunisian railways, 6382 kilometers, of which 2902 kilometers state line; telegraph lines, 15,554 kilometers, wires, 40,624.

**FINANCE, ETC.** The budget for 1915 estimated the revenue at 170,103,318 francs and the expenditure at 170,035,526. For the Southern Territories revenue and expenditure were calculated at 5,060,522 and 5,029,423 francs, respectively. The debt stood Jan. 1, 1913, at 71,853,205 francs. A governor-general administers the country (M. Lutaud in 1916). German reports indicated a semi-religious uprising in Algeria under the leadership of Abdul Melik.

**ALLEGHENY (PA.).** See STRIKES.

**ALLEGHENY COLLEGE.** A co-educational institution at Meadville, Pa., founded in 1815. It is under Methodist Episcopal control, but is non-sectarian in policy. In the fall of 1916 there were in all departments 405 students. The faculty numbered 27. In productive funds the college had \$1,025,595 and from all sources it drew an income of \$174,791. The library contained 44,000 volumes. President, William Henry Crawford.

**ALLEN, FREDERICK M.** See DIABETES.

**ALLIANCE FRANÇAISE, FÉDÉRATION DE L'.** An association of societies in the United States and Canada, incorporated in 1902. It aims to promote the study of the French language, literature, arts, and history. A council which meets five times a year and which is composed of 20 directors, supervises the affairs of the Fédération. A circulating library is maintained. The honorary president of the Fédération is M. Jusserand, French ambassador at Washington. The president of the administrative council is M. J. LeRoy White. There are 50 groups or "circles" in different cities of the United States and Canada, and delegates are sent to an annual convention, the last convention being held in New York in April, 1916.

**ALLIED ECONOMIC CONFERENCE.** A meeting of the representatives of the Entente Allies for the consideration of economic and commercial questions held in Paris, April 20th. See GREAT BRITAIN AND FRANCE, paragraphs on *History*; *TARIFF*; *WAR OF THE NATIONS*.

**ALPENSYPHONIE.** See *MUSIC, Novelities*.

**ALSACE-LOBBINE.** For area and population, see GERMANY; see also *WAR OF THE NATIONS*.

**ALUMINUM AND BAUXITE.** The production of bauxite in the raw material from which the aluminum is obtained was in 1915 297,041 tons, valued at \$1,514,834, an increase of 77,723 long tons, or 35 per cent in quantity, and of \$444,640, or 42 per cent in value, as compared with 1914. The increase for 1915 was abnormal, and is accounted for by the increased activity in the production of metallic aluminum. The great bulk of the bauxite from which aluminum is produced comes from Arkansas, which in recent years has produced about 80 per cent of all the bauxite produced in the United States and in 1915 produced more than 90 per cent. Other States producing bauxite were Alabama, Georgia, and Tennessee. In the production of metallic

aluminum the United States leads all other countries. There were produced in 1915 99,806,000 pounds, compared with 19,129,000 pounds in 1914. There was exported in 1915 aluminum valued at \$3,682,117. The applications of metallic aluminum during the year in Europe have been many and the demand for it has been great. It is employed in the manufacture of cartridges, shells, helmets, grenades, and shell fuses. It is used also for camping equipment, and in the construction of air craft of all kinds. In the United States it is largely employed in the manufacture of automobiles, airships, and miscellaneous war supplies.

**ALUM MAKING PLANTS.** See WATER WORKS AND WATER PURIFICATION.

**AMERICAN AMBULANCE IN FRANCE.** See RELIEF FOR WAR VICTIMS, section so entitled.

**AMERICAN ASSOCIATIONS AND SOCIETIES.** For organizations, the official titles of which begin with the word AMERICAN, see under the specifically descriptive word in that title.

**AMES, WINTHROP.** See DRAMA.

**AMHERST COLLEGE.** A non-sectarian institution for the higher education of men, situated at Amherst, Mass. In 1916 it celebrated its 85th anniversary. Five hundred and five students were enrolled in the fall of 1916, and there were 53 members in the faculty. Within the year Walter W. Stewart of the University of Missouri was appointed professor of economics. Two hundred and fifty thousand dollars was presented by Mr. Edward C. Converse of New York City for a new library building as a memorial to Mr. Converse's brother, James B. Converse, class of 1867. The next largest gift was \$100,000, given by Mrs. Rufus Pratt Lincoln of Plainfield, N. J., to endow a professorship in science in memory of her son, Rufus Tyler Lincoln. At the 1916 commencement, the reunion classes added \$20,500 to the general alumni fund. Five thousand dollars for botanical work came to the college from the estate of Edward Tuckerman, and an equal sum was given by the Rev. George Atwater Hall, class of 1852, to establish a scholarship fund. The productive funds of the college amounted to \$3,000,000 in 1916 and the income to \$230,000. The library has 115,000 volumes. President, Alexander Meiklejohn.

**AMPHIBIA.** See ZOOLOGY, *Amphibia*.

**ANÆSTHESIA.** PARAVERTEBRAL ANÆSTHESIA. This method, which consists in injecting local anæsthetics of the cocaine type deeply into the tissues on either side of the spinal column, thus anæsthetizing the posterior spinal nerve roots, is extolled by Siegel of the gynecologic clinic at Freiburg. He believes it surpasses all other methods in ease of application and in efficiency. Out of 1000 cases the anæsthesia in 95 per cent was complete enough for the operation.

**ANALYSIS, QUALITATIVE AND QUANTITATIVE.** See CHEMISTRY, GENERAL.

**ANAPHYLAXIS.** This interesting and important phenomenon, closely related as it is to the problems of immunity, is receiving greater attention from experimental physiologists every year. The term designates a condition of exaggerated sensitiveness on the part of the animal organism toward foreign proteins, whether injected under the skin or received by way of the alimentary canal. Moschowitz summarizes the essential attributes of anaphylaxis as follows:

1. There is previous susceptibility, which may be congenital or acquired.
2. The reaction is specific.
3. The reaction can be obtained by mouth as well as by injection; also by cutaneous inoculation, such as rubbing into abraded surfaces.
4. Acquired susceptibility can be transferred by heredity to posterity.
5. The constitutional symptoms are respiratory disturbances, dyspnea, œdema, tonic muscular spasms, glandular swellings, joint effusions, albuminuria, and hyperæmic and urticarial skin eruptions.
6. All skin conditions thus far considered as anaphylactic are associated with eosinophilia, such as urticaria, eczema, prurigo, pemphigus, psoriasis, and pellagra.

Strickler and Goldberg of Philadelphia endeavored to ascertain the rôle of various animal and vegetable proteins as etiological factors in certain common skin diseases such as eczema, urticaria, psoriasis, and acne. They prepared extracts of beef, pork, mutton, fish, clams, lobster, wheat, oatmeal, rice, barley, strawberry, tomatoes, cow casein, and white of egg, injected these under the skin, and observed the reaction. Their results, while not conclusive, indicate that many sufferers from these skin affections are especially sensitive toward one or more proteins, and that elimination of these from the diet is often a ready means for curing the disease. Familiar examples of anaphylaxis are persons who are poisoned by eating strawberries, tomatoes, shell fish, and particular meats.

According to observations made at the Johns Hopkins University, patients free from eczema rarely react positively to the anaphylaxis tests. Of 43 patients without eczema only one exhibited evidence of hypersusceptibility, while out of 27 individuals suffering from eczema, 22 reacted positively to cutaneous and intracutaneous tests. White of egg, cow's milk, and women's milk were the substances found to cause a reaction most frequently.

**ANGELL, JAMES BURBILL.** An American educator and diplomat, died April 1, 1916, at Ann Arbor, Mich. He was born at Scituate, R. I., Jan. 7, 1829. After graduating at Brown University in 1849, he served as assistant librarian there and studied abroad for several years, returning to his Alma Mater as professor of modern languages and literatures (1853-60). While at Brown, he wrote much for the *Providence Journal*, and in 1860 he gave up teaching to become editor of this paper, a post he held till 1866, during the Civil War period. His first experience in university administration came during the five years that he served as president of the University of Vermont; his record there was such that in 1871 he was called to the University of Michigan. With this institution his name will always be identified. Its president for 38 years, at a time when the co-educational Western State universities rose from insignificance to a place, some of them, beside their long-established and privately endowed Eastern rivals, Dr. Angell was a leader in the formulation of policies which made the University of Michigan a model followed by other similar institutions. Ann Arbor had an enrollment of 1110 students in 1871; in 1909, when Dr. Angell resigned at the age of 80, becoming president emeritus and chancellor, it was four times as large. At various times, he was called upon to serve in diplomatic capacities. By appointment of President Hayes, he became Minister to China

in 1880, and was also chairman of a commission which negotiated two important treaties, one commercial, the other affecting immigration. After a year he resigned. In 1887 he served on the Anglo-American International Commission on Canadian Fisheries, and in 1896 was chairman of the Canadian-American Commission on Deep Waterways from the Lakes to the Sea. Again in 1897 he was sought out, this time by President McKinley, who appointed him Minister to Turkey. Dr. Angell accepted the post, but resigned within a year. He was a regent of the Smithsonian Institution, and held honorary degrees from many American universities and from Peking University, China. He published *Progress in International Law* (1875); *The Higher Education* (1899); *Reminiscences* (1912); *Selected Addresses* (1912).

**ANGLICAN CHURCH.** See ENGLAND, CHURCH OF.

**ANGOLA.** A Portuguese colony in western Africa with an estimated area of about 490,000 square miles, and a population estimated at 4,200,000. St. Paul de Loanda is the capital. The trade is mainly with Portugal. The colony is administered by a governor-general. See AGRICULTURAL EXPERIMENT STATIONS.

**ANILIN.** See OCCUPATIONAL DISEASES.

**ANNAM.** A French protectorate on the China Sea; a part of the dependency of French Indo-China (q.v.). Hué is the capital, with 65,000 inhabitants, and Bin-Dinh the largest town (75,000).

**ANNAPOLIS.** See UNITED STATES NAVAL ACADEMY.

**ANNAPOLIS AND BALTIMORE UNIVERSITY.** See MARYLAND, UNIVERSITY OF.

**ANNIVERSARIES.** See CELEBRATIONS; EXPOSITIONS; RUTGERS COLLEGE; YALE UNIVERSITY.

**ANTARCTIC EXPLORATION.** See POLAR RESEARCH, *Antarctic*.

**ANTHONY AMENDMENT.** See WOMAN SUFFRAGE, *United States*.

**ANTHONY MEMORIAL HALL.** See WOMAN SUFFRAGE, *United States*.

**ANTHRAX.** See VETERINARY MEDICINE.

**ANTHROPOLOGY.** The effects of the war are at last noticeable in the considerably diminished output of ethnological work. European journals, such as *Anthropos* appear irregularly or have temporarily suspended publication, and practically no monographic studies from abroad have been issued or at least hardly any have reached this country. In America, however, no change is perceptible either in point of publications or of newly undertaken research.

**ARCHAEOLOGY AND ETHNOGRAPHY.** *America.* Very marked progress has been made in the domain of archæology, especially in the perfection of a chronological technique and the application of statistical methods. By the study of potsherds found in visibly stratified and undisturbed refuse heaps N. C. Nelson was enabled to establish "Chronology of the Tano Ruins, New Mexico" (*American Anthropologist*, vol. xviii, pp. 159-180), which is of far-reaching importance for the whole of South-western archæology. He found that apart from the corrugated cooking-vessels and the soft, light "biscuit ware" that occur concomitantly with all other ceramic forms, there are five types of pottery from the earliest times to the historic period,—a local variety of the

black-on-white pottery being superseded successively by glazed pottery, pottery in which ornamental outlines are glazed but filled in with paint, degenerate glazed ware, and the modern painted pottery. While Nelson's work was stratigraphic, that of A. L. Kroeber, as outlined in *Zuñi Potsherds*, was restricted to surface finds. He was nevertheless able to distinguish two definitely marked periods,—the earlier one characterized by a predominance of white ware, while the later, embracing the historic era, shows a preponderance of black pottery. These periods were found capable of subdivision. Corrugated ware preponderates in the earliest of these sub-periods and diminishes throughout the entire span of time considered until its extinction in the present. With A. V. Kidder's sequence reported in the 1915 YEAR BOOK there are thus available three independent chronologies, for the Southwest, and their detailed correlation constitutes a problem for the immediate future. For an entirely different area the determination of a chronology has been attempted by E. W. Gifford in his *Composition of California Shellmounds*, where the age of two mounds is calculated from the total weight of shell or ash found in them, in conjunction with two hypothetical factors, the average population and the average consumption of shellfish by each individual. Gifford infers that the time of mound growth is from 3300-3700 years, thus confirming Nelson's results in the same region. Leslie Spier and Clark Wissler in their correlated papers describing "New Data on the Trenton Argillite Culture," and "The Application of Statistical Methods to the Data on the Trenton Argillite Culture" (*American Anthropologist*, vol. xviii, pp. 181-197) apply the mathematical methods hitherto restricted to physical anthropology to the archæological field. In this way Spier determines that the artifacts in question lie in groups forming a single plane in the upper part of the yellow loam and always with a characteristic vertical distribution, which seems to coincide with that of pebbles in the loam. Wissler argues from these facts and relevant data from elsewhere that the same causes of deposition acted on the artifacts from the several trenches and that the depositing agent at Trenton was geological, being presumably—contrary to current geological opinion—rather water than wind.

In ethnographical work the tendency towards an intensive study of technology is illustrated in Mary Lois Kissell's *Basketry of the Papago and Pima*. A similarly thoroughgoing investigation of a single subject in the economic field is given in F. W. Waugh's *Iroquois Foods and Food Preparation*, while C. M. Barbeau's *Huron and Wyandot Mythology* ranks as one of the most complete collections of folklore from the Eastern Woodlands. The *Twenty-ninth Annual Report of the Bureau of American Ethnology* is dedicated in its entirety to John P. Harrington's paper on "The Ethnogeography of the Tewa Indians," while M. C. Stevenson's "Ethnobotany of the Zuñi Indians" forms part of the *Thirtieth Report*. Data on Zuñi usages have been published by Elsie Clews Parsons (*American Anthropologist*, vol. xviii, pp. 245-256, 338-347). A hitherto practically unknown tribe of the Peace River country is described in P. E. Goddard's *The Beaver Indians*, which con-

sists largely of a collection of tales. The Beaver Indians are an Athapaskan-speaking people of typically Mackenzie area culture; in phonology they are most closely related to the Plains Indian Sarsi. Close contact with the formerly hostile Cree of the same general habitat has doubtless had some influence on their mode of life.

One of the most memorable contributions to the study of North American social organization has been made by E. W. Gifford in his *Miwok Moieties*. It derives special significance from the fact that it furnishes for the first time detailed data as to definite social groups in an area where such divisions were long supposed to be wholly lacking. The Miwok are divided into approximately, though not rigidly, exogamic moieties with paternal descent and named after the Water and Land. Each personal name has an implied or actual reference to an object associated with the moiety of the name-bearer, but since its significance is often purely symbolic it may be intelligible only to the immediate family and friends of an individual. Although the moieties are not, strictly speaking, totemic, the personal names most frequently associated with them refer to the bear and deer, respectively. The Miwok marriage regulations are of great interest. A man frequently married his maternal uncle's daughter, a form of "cross-cousin" marriage hitherto hardly ever reported from North America, though common in Oceania. Since it is not reflected in the kinship terminology at all, Gifford infers that cross-cousin marriage is a recent usage, derived through patrilineal inheritance of privilege from the coexistent custom of marriage with a wife's brother's daughter, which seems to have profoundly affected the terminology of relationship. Other types of matrimonial unions occur, such as that between a man and his brother's wife and with his wife's sister, and these also seem to have colored kinship nomenclature. In a complementary paper on *Dichotomous Social Organization in South Central California* Gifford traces the distribution of the moiety grouping with the result that this form of organization, which was believed to be wholly lacking in this part of America, is found to occur not only in the Miwok territory but also among several tribes of Yokuts stock and among a branch of the Shoshonean Mono, the latter having each moiety subdivided into two clans and non-exogamous. In all the tribes, the Miwok included, the dual divisions have reciprocal functions in funeral ceremonies and are pitted against each other in games. Traces of a possibly totemic division are reported from the Salinan to the southwest, and thus California can no longer be considered the region *par excellence* of a loose social organization. Somewhat farther to the north, among the Yahi and Upper Chinook, the relations of "Terms of Relationship and the Levirate" (*American Anthropologist*, vol. xviii, pp. 327-337) have been emphasized by E. Sapir, who suggests the marriage of a man with his brother's widow or his wife's sister as the reason for a classificatory nomenclature as an alternative for exogamy.

A simplified interpretation of the Aztec calendar system is attempted in T. T. Waterman's *The Delineation of the Day-Signs in the Aztec Manuscripts*. Waterman contends that the wide variation found is not due to historical

development but largely to conscious elaboration or abbreviation by individual artists. A problem of great theoretical interest is discussed in H. J. Spinden's "The Question of the Zodiac in America" (*American Anthropologist*, vol. xviii, pp. 55-80). Various writers, among them notably Mr. S. Hagar, having advanced the hypothesis that the classical zodiac was introduced into America from the Old World in pre-Columbian days, Spinden examines the evidence and arrives at a negative result. The question of the independent evolution of a conception akin to the zodiac is left open.

Perhaps the fullest data ever published on the religious and mythological conceptions of any South American aborigines have been furnished in "An Inquiry into the Animism and Folk-Lore of the Guiana Indians" by W. E. Roth (*Thirtieth Annual Report, Bureau of American Ethnology*, pp. 103-386). Dr. Roth shows that the Caribs, Arawaks, and other natives of this region did not have the conception of a Supreme Being but merely a belief in tribal heroes and a host of spirits inhabited the water, bush, sky, etc. The practice of the couvade, which attains its highwater mark here, is explained as due to the notion that a child is part and parcel of both parents and even at birth is not considered to have an independent existence. The medicineman plays an important part in tribal life. He was not merely a medical practitioner but also a dream-interpreter, prophet, depository of tribal lore, and the giver of personal names.

In *The Indians of Cuzco and the Apuromac* Prof. H. B. Ferris presents a study of the anthropometric material of the Quichua people collected by Dr. L. T. Wilson in connection with the Peruvian expedition of 1912 under the auspices of Yale University and the National Geographic Society. The Quichua are a people of low stature (1.58 m.) with unusually well-developed shoulders and thoraces, probably to be correlated with the carrying of burdens on mountain trails and breathing of rarefied air. The skin color varies from light brown to dark brown, and the hair is black, straight, and abundant on the scalp. In point of head form this tribe is mesocephalic, but verging on brachycephaly, the average index being 79.9, very nearly the same as for the Shoshoni and Chiriguan Indians. The face is broad and short, the lips are thick or medium, while the nose has a straight or wavy dorsum, a moderately prominent root and markedly divergent nostrils. In respect to physiognomic traits and body proportions the Quichua resemble North American tribes.

*Africa*. N. W. Thomas has published an *Anthropological Report on Sierra Leone* in three parts, devoted to general ethnography, lexicography, and grammar, respectively. The tribes dealt with are all of Sudanese stock, the Timne, Limba, and Bulem representing the subdivision with prefixing languages, while a second subdivision with prefixless tongues is formed by the Mandingo and Mendi. The culture of all these tribes is remarkably uniform, representing the West African type with its efflorescence of secret organizations and such socio-religious rites as circumcision and clitoridectomy. There are clans with paternal descent, though exogamy is on the wane, and while these divisions lack totemic names they observe distinc-

tive taboos. The clans are highly localized, being often restricted to definite territories and sometimes comprising the whole population of a village. Houses, except for intrusive rectangular forms, are everywhere of circular plan, with conical, thatched roofs. An anomaly is represented by the hitherto unexplained appearance of stone houses among the Limba of the Kaballa district. Pottery, which is of the coiled variety, is practiced mainly by the Mendi, while loom-weaving flourishes among the Susu, Mendi, and Limba. Native suspension bridges of creepers are used in crossing rivers, and the hammock has a general distribution throughout the protectorate.

Important new data on the Banyoro and Basoga, as well as on two Nilotic tribes, are published in John Roscoe's *The Northern Bantu*. Like the Baganda, the Banyoro represent the population of a very old Central African kingdom. Part of the people are entirely pastoral, while the remainder, apparently antedating the former in occupation of the country, are mainly agricultural. This cultural division accompanies a racial difference, the herders being of taller stature and more European physiognomy. The king was a powerful sovereign, the sole possessor of the soil, and ruler over a host of princes, chiefs, and sub-chiefs. As in some other parts of Africa, the king's mother also enjoyed the status of an independent potentate. The aristocracy of the realm is constituted by the pastoral group, the peasants form a caste of commoners, while those farmers who also own herds of cattle are of intermediate rank. This economic division is further reflected in the totemic organization. While all three castes are organized into exogamous totemic gentes, the names of the pastoral gentes are derived from cattle, those of the farmers' gentes from plants and agricultural objects, and those of the intermediate caste from both types of objects. The rule of exogamy is relaxed only in the case of royalty, even brother-sister marriages being permitted in the king's family.

The Basoga have always been tributary to surrounding nations. They are of Negroid physique and economically agricultural. A cult of the dead constitutes the most conspicuous of their religious practices, but fetichism likewise flourishes. An important group of rites, some of them connected with human sacrifice, have for their object the making of rain. Of the Nilotic tribes investigated by Roscoe the Bateso of Lake Kyoga are a peaceable people subsisting mainly on agricultural products, though cows, goats, and sheep are kept and hunting forms a secondary economic pursuit. There is a division into exogamic gentes with the peculiarity that several gentes bear the same name, but are distinguished by their totems. The Nilotic Kavirondo must not be confounded with their Bantu namesakes. They inhabit the territory extending southwards from Mt. Elgon along the coast of Lake Victoria Nyanza. Though settled in groups of villages among the Bantu they do not intermarry with them and remain distinct in language and custom. Millet and maize form the staple diet, but cows form the principal wealth of the people. Milk is used as an article of food and oxen are ridden. Both boys and girls pass through an initiation ceremony in which four front teeth of the lower

jaw are removed, the girls being subjected to an additional ordeal of scarification.

C. M. Firth has published the result of his archaeological researches, *The Archaeological Survey of Nubia*, and important conclusions of a general character are offered in E. A. Hooton's "Preliminary Remarks on the Archaeology and Physical Anthropology of Tenerife" (*American Anthropologist*, vol. xviii, pp. 358-365). The Guanches, i.e., the ancient natives of this and other Canarian Islands, have been regarded as relatives of the tall (1.78 + m.), long-headed, and broad-faced cave-dwellers of the upper paleolithic of France known as the Cro-Magnon race. Hooton finds that the Canary Islanders were of moderate stature (1.64 m.). The skulls are predominantly of Mediterranean form; a much larger long-headed type occurs, and there is also an intermediary type suggesting mixture of the two others. The craniological evidence for the Cro-Magnon theory is thus quite inadequate. Linguistically, the recorded Canarian material points to the Berber of the Atlas and the Kabyles. Culturally the Guanches were not representatives of a paleolithic culture. They were not hunters like the Cro-Magnon but goat-herds and barley-growers. They neither engraved on bone nor painted the walls of their caverns. If their stone technique remained on a low level, this was presumably for lack of suitable material. The ethnological affinities of the Canarians were probably not with any paleolithic race but with the Berber; the Islands were presumably colonized during the recent period by settlers from the African mainland who brought with them their domesticated animals.

*Oceania.* The first summary yet attempted of the mythology of the entire Indonesian, Oceanian, and Australian regions has been supplied by Roland B. Dixon in *The Mythology of All Races: Oceania* (vol. ix). Certain important results as to cultural relationships and migrations develop from this survey. Of the Polynesians, the Hawaiians and New Zealanders have preserved most of the original stock of mythology, while the other Islanders have absorbed considerable alien material in the course of subsequent migrations. The Hawaiians seem to have merely grazed the northern fringe of Melanesia, but reveal a close affinity with Indonesians and Micronesians. The Central Polynesians, on the other hand, have been largely affected by Melanesian contact. In Melanesia two distinct strata may be separated, corresponding to the racial divisions found,—an older Papuan mythology lacking cosmogonic features and emphasizing the belief in ghosts, and a later Melanesian stratum in which origin myths are better developed and a particular fondness for cannibalistic tales is displayed. Many parallels with Micronesian material occur, supporting independent anthropological evidence of affinity of these two regions, and the fact that Polynesian resemblances are confined to the eastern Melanesian archipelago confirms the hypothetical route of the Polynesians through that group rather than through New Guinea. Indonesian mythology is overlaid with Hinduistic and Islamic elements of relatively recent introduction, but when these intrusive factors are eliminated similarities with Melanesia, Micronesia, and Polynesia are unmistakable, and on general grounds an intimate re-

relationship with the wilder tribes of Southern China must be assumed. The basic mythological affinities of Australia remain obscure on account of our complete ignorance of the folklore of the extinct Tasmanians, but in the north-east elements of the other Oceanian mythologies crop up. Apart from the primitive Tasmanian and Negrito layers of which we remain ignorant, the characteristic Oceanian myths seem to have been spread by a series of waves coming from the Asiatic mainland through Indonesia, passing thence on the one hand to Micronesia and Hawaii and on the other through Southern Melanesia to Polynesia. The American analogies with Oceanian episodes remain mysterious anomalies.

**MEETINGS, EXPEDITIONS, PERSONALIA.** The American Anthropological Association (president, F. W. Hodge) and the American Folk-Lore Society (president, Robert H. Lowie) met at New York City, December 26th-29th, in conjunction with Section H of the American Association for the Advancement of Science.

The Bureau of American Ethnology supported archaeological work in the Southwest by Dr. J. W. Fewkes and linguistic investigations among Algonkian tribes by Dr. T. Michelson and in Oregon by Dr. L. J. Frachtenberg; ethnological researches were conducted by Miss F. Densmore on the music of the Mandan and Hidatsa, by Mr. F. La Flesche among the Osage, Mr. J. Mooney among the Cherokee, and Mr. J. N. B. Hewitt among the Iroquois of Ontario and New York. Dr. Walter Hough of the U. S. National Museum, after returning from the reinstallation of the San Francisco government exhibit at the San Diego exposition, conducted archaeological and ethnological research in western New Mexico and northern Arizona. Dr. W. E. Roth made an ethnological collection of British Guiana material for the Smithsonian Institution. Under the auspices of the Carnegie Institution Mr. S. G. Morley visited the ruins of Quirigua and Copan, where he was met by Prof. W. H. Holmes of the U. S. National Museum. The American Museum of Natural History financed both archaeological and ethnological work in the Southwest: Mr. N. C. Nelson continued excavation in the Galisteo region, Mr. E. H. Morris examined the Aztec and the San Juan drainage ruins, while stratigraphic work at Zufii was allotted to Mr. L. Spier; Professor Kroeber at Zufii, Dr. P. E. Goddard among the White Mountain Apache, and Dr. R. H. Lowie among the Hopi devoted themselves to the study of social organization and ceremonialism. Under the same auspices Mr. G. L. Wilson visited the Mandan and Hidatsa, while Dr. H. J. Spinden visited Venezuela and later Porto Rico for archaeological research. Mr. C. W. Bishop returned to the University of Pennsylvania after an exploration of the Chinese province of Szechuan. The Museum of the American Indian, Heye Foundation, financed archaeological work by Messrs. M. H. Harrington and A. B. Skinner in Arkansas, and by Messrs. Skinner and W. Moorehead in Pennsylvania and New York; Mr. T. De Booy resumed his survey of the Antilles and Central America. The Peabody Museum dispatched Mr. A. Carpenter for an exploring trip to Guatemala. Under the auspices of the University of California Mr. L. Outhwaite made an archaeological survey of the Santa Barbara archipelago and Dr. J. A.

Mason studied the Salinan language; with the aid of a joint grant from this institution and the New York Academy of Sciences Mr. E. W. Gifford collected data on California kinship systems. The Geological Survey of Canada dispatched Mr. C. M. Barbeau to collect folk-songs and tales among the French Canadians of the lower St. Lawrence region, while Mr. F. W. Waugh investigated the technology of the Ojibwa and Mr. D. Jenness continued his ethnological work as a member of the Stefánsson expedition. Under the same auspices a visit to Ottawa of Indian chiefs from British Columbia was used for somatological measurements and ethnological investigation by members of the staff.

Physical anthropology sustained a severe loss through the death of Prof. Hermann Klaatsch, prominently identified with the study of evolutionary problems, and folklorists mourn the demise of Sir Laurence Gomme, one of the most active British investigators of mythology and kindred fields.

**PHYSICAL ANTHROPOLOGY AND THE ANTIQUITY OF MAN.** This tendency to study the racial types of European nations continues to be stimulated by the political situation. L. Bartucz, in a paper on "The Stature of the Modern Magyars," finds that the average height of Hungarian men is between 167 and 168 cm., the mean stature of the women approximating 154 cm. A very considerable regional variation is noteworthy, suggesting mixture with different racial types. The maximum height is attained at the age of 29; it descends gradually in the thirties and very rapidly after 60. In this connection may be mentioned a paper by Emil Fischer on "The Proportion of Slavic Elements in Rumanian" (*Korrespondenz-Blatt*, xlvii, p. 56 *et seq.*), for while using primarily linguistic data this author's object is to prove that the Rumanians of to-day are not a pure Latin stock but represent a mixture of Latin and Slavic elements. The language is a mixture of Thracio-Romance and Slavic, while somatological traits, such as pronounced short-leggedness, brachycephaly, dark hair, and fecundity, point to an infusion of Slavic blood. The problem of the racial affinities of the primitive Slavs is attacked by K. F. Wolff (*Mannus*, viii, 35 *et seq.*), who arrives at the conclusion that the "Altslaven" were North Europeans and more particularly East Germans who adopted a Slavic tongue from Little Russian and other sources and acquired secondary somatological traits by mixture with alien stocks. Notes on the Montenegrins are furnished by Pittard (*Revue anthropologique*, 1916, p. 198 *et seq.*), who finds them to be typical representatives of the tall, short-headed Dinaric race. Unfortunately the pages of the *Revue* are now largely occupied with vituperative characterizations of the Germans which transgress all bounds of decency and taste. Thus, M. Capitan proves to his satisfaction that the Germans are criminal lunatics (p. 79) emitting offensive odors in the most literal sense of the term. The German counterblast to this species of anthropological war literature is to be found in Professor Kossinna's *Mannus* (vii, pp. 187-190), where the French are described as a nation of degenerates who will surely meet with condign punishment.

Other continents have not been wholly neglected. In *L'Anthropologie* (xxvii, pp. 47-95,

211-242), M. Verneau summarizes M. de Gironcourt's West African observations, according to which the Tuareg of the caste of noblemen are both markedly dolichocephalic and of very tall stature (175 cm.). A monograph on Peruvian skeletal finds has been published by George F. Eaton under the title of "The Collection of Osteological Material from Machu Picchu" (*Mem. Conn. Academy of Arts and Sciences*, vol. v). Dr. A. Hrdlička's study of "Physical Anthropology of the Lenape or Delawares, and of the Eastern Indians in General" (*Bureau of American Ethnology*, Bulletin 62) shows that the Iroquois, while linguistically distinct from surrounding Algonquins, show no somatological individuality as compared with these alien neighbors. Physically, the stocks are identical. All Eastern crania belong to the same type, characterized by marked to moderate long-headedness in males and by moderate dolichocephaly to mesocephaly in females. This type is akin to that of the Shoshoneans in the West, the Piman-Aztec in the South, and the Andean type of South America. Where suggestions of brachycephaly appear, Dr. Hrdlička traces them to admixtures of probably recent origin. Among descriptive contributions must be mentioned E. W. Hawkes' "Skeletal Measurements and Observations of the Point Barrow Eskimo" (*Amer. Anthropologist*, 1916, pp. 203-244). The results of racial mixture have been investigated by A. E. Jenks in his *Indian-White Amalgamation, an Anthropometric Study*.

Views bearing directly on anthropological problems are advanced in William K. Gregory's paleontological *Studies on the Evolution of the Primates*. From comparative anatomical and embryological data this student infers that man and the anthropoids have been derived from a primitive anthropoid stock, man's nearest living relatives being the chimpanzee and gorilla. While with these, however, ancestral habits and character of brain, dentition, skull, and limbs have persisted with only subordinate changes, the forerunners of the Hominidae underwent a profound change in function, giving up arboreal frugivorous adjustments and becoming at an early period terrestrial, bipedal, and predatory, with the development of crude flints for cutting up and smashing the varied food. The ancestral stock from which man, the gorilla, and the chimpanzee have sprung is represented by two Upper Miocene genera—*Sivapithecus* and *Dryopithecus*—of which the former is more directly the ancestor to the Hominidae. Man differs from the *Sivapithecus* largely in the way of retrogressive changes due to the alteration of his food habits. In this connection Gregory cites the retraction of the face and dental arch, the reduction of the canines and of the jaw muscles, as well as the loss of the prehensile character of the hallux. Other differences are secondary adjustments in relative proportions, connected with the change from semi-arboreal to fully terrestrial bipedal locomotion. The Hominidae probably branched off from the Simiidae not earlier than the Miocene or even Upper Miocene. *Homo heidelbergensis* seems to be the direct ancestor of all later Hominidae.

**GENERAL ETHNOLOGY.** Though the detention of Graebner as a military prisoner on Australian soil renders the discussion of his theoretical views a somewhat one-sided affair, the reverberations of the hubbub created by his theories of

diffusion and cultural strata are still audible. In a dissertation on "The Idea of Fertilization in the Culture of the Pueblo Indians" (*American Anthropological Association, Memoirs*, iii, pp. 1-55), H. K. Haeberlin attacks more particularly the complete neglect of psychological factors practiced by Graebner and his followers. This is done with special reference to the concrete facts of Pueblo culture. The Navajo and Hopi share many ceremonial features, the presence of which is intelligible only by borrowing. But this conclusion, which exhausts the phenomenon from Graebner's point of view, is in reality of very limited significance. For the same objects which the Navajo employ to cure the sick are used by the Hopi to produce rain. An analysis of Hopi ceremonialism reveals the predominance of this idea of fertilization, which really forms the distinctive trait of Pueblo culture as distinguished from that of other regions. This setting entirely eludes a Graebnerian analysis, which looks on a culture as the mere summation of cultural objective atoms. Since the importance of this cultural atmosphere cannot be doubted, the purely external point of view is thus reduced to an absurdity.

If Graebner himself is unable to take up cudgels on behalf of an unlimited tendency to diffusion, English protagonists of the theory have arisen for whom the boundaries of time and space no longer exist. Foremost among recent converts is Prof. Elliot Smith, who interprets an elaborately carved Central American idol as the undoubted representation of the elephant of India, made, however, not after nature but copied from an earlier model presumably made by an Asiatic immigrant. This position is obviously of tremendous importance since the indigenous or derived character of pre-Columbian civilization in Central America is linked with the problem here broached. Elliot Smith flouts the theory of Maudslay that the proboscidean might represent the indigenous tapir, as well as Seler's hypothesis that the carving suggests tortoise heads. Arguing against Smith on the basis of the Maya style of realistic representation, Drs. Tozzer and Spinden have independently reasserted the approved American view that the animal in question is a blue macaw. In a spirited rejoinder Elliot Smith protests against the ethnological "Monroe doctrine" which vindicates an exclusively aboriginal origin for the native American cultures and supports his argument by a comparison of the folklore gathered round the rain-gods of India and Mexico. More specifically, much of the ancient Indian pantheon centred round the god Indra is alleged to have been bodily adopted by the Maya. Smith assumes that the process of diffusion began about 200 B.C. and continued for a long period, the several cultural elements being brought in by small bands of immigrants whose higher status of civilization enabled them to effect an influence on the cruder autochthonous population quite disproportionate to the number of the transmitting groups. In this way practically every element of the early civilizations of America is said to have been borrowed from the Old World,—a truly astounding conclusion for the professional Americanist. (For the entire discussion, see *Nature*, xcvi, pp. 340 f., 425, 501, 592-594, 612.)

In another paper on "The Origin of the Pre-Columbian Civilization of America" (*Science*,

1916, pp. 190-195), Elliot Smith with, if possible, greater vigor than ever attacks the idea of an independent evolution of American culture. According to this latest pronouncement, the period of the New Empire in Egypt witnessed a combination of bizarre and disparate practices, some of them of older standing, and in this new form the chance association of cultural traits began to spread some time after 900 B.C. from Egypt to the eastern regions, until with various Ethiopian, Mediterranean, West Asiatic, Indian, Indonesian, East Asiatic, and Polynesian modifications and additions it reached America. The doctrine of independent development is repudiated on the ground that the traits in question are far too numerous and specific and their association purely fortuitous, so that psychic unity as an explanatory factor seems out of the question. In reply to Smith, A. A. Goldenweiser (*Science*, 1916, pp. 531-533) vindicates the claims of the theory of independent evolution wherever diffusion has not been definitely proved. Philip A. Means (*ibid.*, p. 533 f.) urges against the Egyptian origin of American culture the absence of the wheel in aboriginal America, and the low development of Central and South American navigation. He also regards the period of time suggested by Elliot Smith for the process of transmission as entirely too short, proposing as a substitute 1500 B.C. as the approximate date at which the cultural wave might have begun to roll from Egypt toward the New World.

The discussions of the position of ethnology with reference to other branches of learning are being vigorously continued. Two authors have independently advocated the definition of ethnology as a purely historical science, as voiced by Kroeber in his "Eighteen Professions" (see YEAB BOOK for 1915). In his address on "Psychology and Ethnology" (*Folk-Lore*, xxvi, pp. 115-137), A. M. Hocart argues that the ethnologist's business is to determine the series of social changes by historical research. Psychology is of no use for ethnological problems because of the psychic unity of mankind. Our subject-matter is the "ever changing and endless variety of custom and belief," and this cannot be deduced from a psychic constant. The psychological interpretation is irrelevant because of its generic character where the demand is for a specific account. Similarly C. Wissler in his "Psychological and Historical Interpretations for Culture" (*Science*, xliii, pp. 193-201), finds that all attempts to explain particular cultural traits as due to psychic unity have been abortive and that the reason for the development or association of certain ideas can be ascertained only historically, while the most minute description in psychological terms would be futile. Psychology can be of use to ethnology only by defining what human activities are due to innate equipment and which are the result of nurture, as opposed to nature. A vigorous rejoinder to Kroeber's "Eighteen Professions" has been published by H. K. Haeberlin (*American Anthropologist*, 1915, pp. 756-759), who protests against the rigid exclusion of psychology from the ethnological sphere; as the science of all mental phenomena, he contends, psychology is the ideal link for uniting the natural and the mental branches of knowledge.

A suggestive contribution to the psychology of scientific thinking is made by Kroeber in his

"Inheritance by Magic" (*American Anthropologist*, 1916, pp. 19-40). He begins with the hesitancy of biologists to relinquish the notion of the inheritance of acquired characteristics. This attitude, he holds, is the result of a naive confusion of biological with ethnological modes of thought. All of us note the "use inheritance" or transmission of traditional culture elements; the biologists in question are merely transferring, by a false analogy, a fact of social science to the domain of organic processes. It is merely necessary to recognize the source of their error, and the belief in Lamarckian factors will be swept away.

Among the synthetic works of large scope that were launched during 1916 may be mentioned *The Mythology of All Races*, edited by Louis H. Gray and published by the Marshall Jones Co. of Boston. This is intended to comprise thirteen volumes, of which two (i, "Greek and Roman" by William Sherwood Fox, and x, "North American" by Hartley Burr Alexander) have been published during the current year.

#### ANTI-SALOON LEAGUE OF AMERICA.

Largely as a result of the work of the League, State-wide prohibition of the liquor traffic was adopted in four States, Montana, Nebraska, South Dakota, and Michigan, at the general election held on Nov. 7, 1916. This makes a total of 23 States that have taken such action. Two other States, Utah and Florida, elected Legislatures pledged to enact State-wide prohibitory laws. At the end of the year 89 per cent of the land area of the United States, embracing 59 per cent of the population, was legally "dry," and when the new laws in the four States named, together with the Territory of Alaska, go into effect, these percentages will be largely increased. While the Anti-Saloon League works for prohibition, whether by State-wide measures or local option, its great objective is national prohibition, to be secured through an amendment to the Constitution of the United States. Before the end of 1916 both the House and the Senate Judiciary Committees had voted to recommend passage of the bill drafted by the League. The Postoffice Committee had voted to recommend passage of a bill to bar liquor advertising from the United States mails, and a Senate vote in January had been promised on a bill for prohibition in the District of Columbia. The officers of the League for 1917 are as follows: President, Bishop Luther B. Wilson; general superintendent, Rev. P. A. Baker, Westerville, Ohio; secretary, Rev. S. E. Nicholson; treasurer, Foster Copeland.

**ANZAC.** A name that came into prominence during the War of the Nations as indicating the Colonial troops of Great Britain. It was composed of the initials of the more important British Colonial possessions, namely, Australia, New Zealand, Africa, and Canada.

**AQUEDUCT.** NEW YORK: The development of a 250,000,000 gallons per day addition to the Catskill water supply system of the city of New York was authorized during the year and funds were made available for utilizing the Schoharie watershed. This involves the building at Gilboa of a large dam, probably between 200 and 300 feet high, to impound the water from the Scho-

harie drainage area, amounting to 314 sq. miles, and the construction of a tunnel 18 miles long to convey the water to the Ashokan Reservoir of the present system. The estimated cost of this addition was \$22,000,000 and the construction of the dam and tunnel were to require about eight years. The tunnel was to be about 11 feet in diameter and was to be driven from eight shafts ranging in depth from 100 to 640 and distant from each other about 10,400 to 14,200 feet. It was to pass through one of the main ranges of the Catskill Mountains extending from a point on Schcharie Creek below the dam site at Gilboa to Aesopus Creek near Shandaken. The tunnel was to be at hydraulic gradient with a slope of about 4 feet per mile and have a concrete lining with a minimum thickness of 12 inches.

At the end of the year the completion of the Catakil Aqueduct was virtually consummated, and Mayor Mitchel of New York appointed a committee to arrange to formally celebrate this event in 1917. The twelfth anniversary of the appointment by Mayor McClellan of the three commissioners of the Board of Water Supply would occur in June, 1917, at which time would also occur the 75th anniversary of the turning of Croton Water into the city of New York.

LOS ANGELES. During 1916 surplus water from the Los Angeles Aqueduct amounting to 125 second feet was being furnished to the San Fernando Valley. Of this amount 100 second feet was being used for the irrigation of 20,000 to 30,000 acres and the remainder for domestic purposes. The irrigation supply first utilized in May, 1915, was being developed so that eventually 87,300 acres would be irrigated by aqueduct water. While a single distribution system had been planned political conditions required two geographical divisions. The San Fernando irrigation district No. 3 with 76,090 acres was formed in 1914 and in the following year voted \$2,606,000 bonds so that actual construction was begun in 1916. The other division known as the Mission District with an area of 11,215 acres completed its organization and voted bonds for construction work. The general scheme of development provided for serving the irrigated area by trunk lines ranging from 54 to 30 inches in diameter. It was estimated that 1 inch of water, continuous flow, would be required for every 7½ acres within the district. That is the equivalent of 1 inch to 5 acres for an irrigation season of 240 days. When the district is fully served it will use surplus water to the extent of more than 11,000 inches, giving Los Angeles an approximate revenue of \$250,000 a year. The annual sales in 1916 totaled approximately \$100,000.

Contracts amounting to approximately \$559,755 for pipe and materials were awarded and were followed by contracts for additional pipe. The advanced methods followed in the construction of the aqueduct proper were also seen in this work. To July 1st approximately 25 miles of trunk lines and laterals had been constructed and placed in operation.

The pipe was hauled to the valley and distributed along the ditches by auto trucks. Steam shovels excavated the main trenches, while smaller laterals were dug by power excavators and a power-driven machine was used for back-filling. Thus practically the entire work is done without hand labor.

It was estimated that the total cost of completing the system would be \$4,354,895.

WINNIPEG. In the construction of the Winnipeg aqueduct described in the 1915 YEAR BOOK an important feature of the year 1916 was the cracking of considerable portions of the concrete structure. Out of 65,390 feet of aqueduct completed in 1915 cracks developed in the invert of about 14,380 feet. Usually there was a single crack along the middle, but in a few of the badly cracked sections there were also cracks in the side walls of the arch. A board of engineers investigated the matter and found that the cracks were due to the settlement of the aqueduct where it was founded on compressible soil. Repairs were undertaken by cutting out the crack to a depth of 1½ to 2 inches and to a width of about 1 inch. This was packed with neat cement slightly moistened and hammered into place with a calking tool. Tests showed that the joint was of considerable strength and breaks were more likely to occur in the old concrete. For new construction the board recommended that in firm soil the base of the invert should be extended on both sides to a length of 8 inches beyond the sidewall and that in compressible soils the inverts should be heavily reinforced. This was done and in the construction of 1916 no settlement cracks developed. Modifications in the plans in the interest of economy may be possible, but a revised estimate for the entire project taking into consideration the changes found necessary amounted to \$6,867,700, as compared with the original estimate of cost of \$7,097,640.

MONTREAL. A voluntary commission of seven prominent Canadian engineers, of which W. S. Tye was chairman, submitted a report on November 20th to the city authorities of Montreal on the water-power project which has been under construction for several years in connection with the city's water-supply. This involved the enlargement of the open canal originally used to divert water from the St. Lawrence River for municipal purposes. In 1909 a closed reinforced concrete conduit was built along the route of the canal and while this was adequate for the city's water supply, the power project was advanced so as to reduce the cost of pumping and afford power for various municipal purposes. The commission found that the final cost of the water power project would be at least \$10,600,000, and that not over 7000 horse power could be developed. The minimum fixed charges and operating expenses of the power plant would be \$108 per horse power per annum, while the city could purchase power in the open market from some of the hydroelectric plants in the vicinity of Montreal for not more than \$20 to \$25 per horse power per annum.

The commission urged that the city should abandon the present project, on which it had already expended over \$5,000,000, and estimated that by so doing it could save \$262,000 per annum by purchasing power compared with the cost of completing the present project. This elaborate project, it was alleged, originally was undertaken by the municipal government without adequate and competent engineering advice.

See WATER-WORKS AND WATER PURIFICATION. **ARBITRATION, INTERNATIONAL.** See INTERNATIONAL PEACE AND ARBITRATION.

**ARBITRATION AND CONCILIATION, INDUSTRIAL.** As in preceding years, 1916 brought an increase in the sentiment in the

United States favoring the application of methods of arbitration and conciliation in preference to strikes and lockouts and other displays of force in the settlement of industrial differences. Street railway strikes in New York, Washington, and elsewhere, and especially the threatened strike of the great Railroad Brotherhoods in the late summer, brought sharply before the public the question of the advisability of compulsory arbitration in industries intimately connected with the general welfare of cities or of the country. Another tendency of recent years was illustrated by the renewal of various trade agreements and by the reestablishment, after a bitter strike, of the protocol in various branches of the clothing industries in New York. A few of the important controversies and their settlements are described below. For others, see STRIKES AND LOCKOUTS.

**CLOAK AND SUIT INDUSTRY OF NEW YORK.** For six years controversies between employer and employee, in this industry, have been settled by means of the famous protocol devised by Louis Brandeis and others and accepted by the Manufacturers' Association in 1910. This was a progressive instrument in arbitration and though not used always with success had at least contributed much toward keeping peace. In May, 1915, relations of protocol were declared severed by the Manufacturers' Association, but early in July both sides agreed to submit differences to a Council of Conciliation appointed by Mayor Mitchel. The old board of arbitration not being reestablished the Council with tacit consent of both association and union assumed its duties. On March 1, 1916, the Council made the decision that a union man eligible for employment under terms of the "preferential union shop" clause of the agreement should be one of good standing with union dues paid up. But March 3rd, the Cloak, Suit, and Skirt Manufacturers' Protective Association not only notified the Council of Conciliation that it would not accept the recommendation "because it created new legislation," but refused to send representatives to a conference which the Council had called. The various locals of the International Ladies' Garment Workers' Union replied by saying they were unable to deal longer with the Association. With no means for settlement of the controversy a general strike among workers of the industry was then imminent. In order to avert it, Mayor Mitchel called a conference to which were invited E. J. Wile, president of the Association, Benjamin Schlesinger, president of the Union, members of the Council of Conciliation and several representative citizens, Jacob H. Schiff, Oscar S. Straus, W. C. Breed, and Dr. Henry Moskowitz. The Manufacturers' Association refused to attend this, the result of an attitude due chiefly to a small reactionary faction. But the Association held a secret session during which it decided to close its shops and fight the Union, defending itself with the plea that the controversy was over the old principle of open and closed shop and that the open shop was necessary to the success of the business. J. H. Schiff and Oscar Straus then made a further attempt to avert a lockout by inviting the 409 members of the Manufacturers' Association to discuss various means of settlement in a private conference. But only 30 of the members attended and no decision was reached.

Meanwhile a parade and demonstration on May Day by the strikers further complicated the situation. Three hundred and fifty of the 1800 independent clothing manufacturers and three of the 409 members of the Manufacturers' Association then made individual settlements with the strikers, with the result that several thousand of the 60,000 strikers returned to work, agreeing to devote a certain per cent of their wages to the Union. All manufacturers asking individual settlements were expelled by the Association.

The stock and shipping clerks in the cloak, suit, and skirt factories then joined the Union, increasing the number of strikers. However, C. L. Bernheimer, chairman of the Arbitration Committee of the Chamber of Commerce, averted a strike in the men's clothing industry by successful arbitration. Workers in the industry in factories outside of New York City were called to join the strikers, and by May 11th the strike had spread to Chicago, Vineland, N. J., and Stamford, Conn. The Union further crippled the Manufacturers' Protective Association by prohibiting the Merchants' Society of Ladies' Tailors from selling styles to members of the Association.

Throughout the controversy with one exception the Manufacturers' Association had refused to confer with any one, and hence it was held responsible for conditions not only by the Union but by citizens and economists as well. But the crisis in the strike came June 1st when the employers of the Manufacturers' Association threw open their doors to "open shops" and invited the Union to return but on the employers' terms entirely: the workers refused to go back since no concession had been made them.

The Mutual Cloak, Suit, and Skirt Manufacturers' Association now offered to let Mayor Mitchel arbitrate the strike, but the Union, fearing this a ruse on the part of the Protective Association, refused. Finally, however, the strike was terminated August 4th, and a new agreement was then signed by representatives of the Cloak, Suit, and Skirt Manufacturers' Protective Association, of the International Ladies' Garment Workers' Union, and of the Joint Board of Cloak Makers Unions of New York City. The following is a summary of the main points of the new agreement: 1. Preferential union shop for worker proving union membership. 2. Forty-nine hours in week's work of six days. 3. No overtime work in manufacture of cloaks and suits between November 15th and February 1st nor between April 15th and August 15th. Manufacturers of special lines shall have right to establish periods different from these according to demands of business. But overtime shall not exceed 10 hours a week nor 2½ hours a day and shall be restricted to first five working days of the week. Additional overtime shall not be permitted save in cases of emergency and then only with consent of union, with double pay for overtime for week workers. 4. Minimum wages were increased. All piece rates to be settled between employer and price committee of shop. 5. No time contracts except with foremen, designers, and pattern graders. 6. No strike to be called by union nor lockout by employers until after 24 hours' notice. 7. Agreement shall continue three years from date of execution.

**THREATENED RAILROAD STRIKE.** One of the most notable instances of attempted arbitration

in the United States was that of the conference of railroad men in New York City in August. This conference was held between 25 men representing 225 railroads with \$20,000,000,000 of capital and five men representing the four great railroad brotherhoods, Locomotive Engineers, Enginemen and Firemen, Railroad Conductors, and Railroad Trainmen. Chairmen of the conference committees of these brotherhoods to the number of 600 from all over the United States were also present.

The discussions of the meeting dealt with hours, wages, schedules, and overtime pay. The employees demanded an eight-hour day with one and one-half pay for overtime, the demand applying only to the freight service. In making this demand, brotherhoods cited 78,940 cases where the working day had been in excess of the maximum number of 16 hours permitted by Federal law. In reply employers asserted that if the demand were granted \$75,000,000 to \$100,000,000 would be added to the annual payroll, and hence as most railroads pay low dividends, it would necessitate an increase in freight rates. Moreover, this increase in salaries would affect only 18 per cent of the employees and as those affected were already the highest paid men, such an increase would be unfair to the other 82 per cent. The employees then attacked the validity of wage figures offered by the companies, saying they were able to earn a reasonable income only by working excess hours.

After several days of discussion, the contending parties were unable to arrive at an agreement. Negotiations before the Federal mediators were then taken up, but ended in a deadlock, both parties refusing to arbitrate. By a referendum vote of the unions previously taken 95 per cent of the total membership had authorized a strike, and the whole country faced the calamity of famine and a general tie-up of business. When matters were at such a crisis, President Wilson called both sides to the White House for a conference, and for a week devoted his entire time to adjusting the issues. Finally the President proposed that the railroads should concede the eight-hour day with straight time payment for overtime, and that the unions' demand for one and one-half times pay for overtime and the railroads' demand for elimination of double pay should be held in abeyance while the eight-hour experiment was being made. This done, the President promised to secure authority from Congress to appoint a committee to investigate and report on the situation, either side being free then "to give notice of a termination of the present agreements with a view to instituting inquiry into suggested readjustments of pay or practice." This plan was approved by the chiefs of the four brotherhoods and formally accepted by the committee of 600 minor union officials to whom power of settlement had been given. But it was unanimously rejected by the managers' committee and 33 railroad presidents on the claim that they were contending for the principle of arbitration.

On August 29th, when it was evident that the railroad presidents had no new measures to propose, and when 600 chairmen of the brotherhoods had gone home with orders for a strike to become effective September 4th, President Wilson addressed a joint session of the two Houses of Congress. He asked for the adoption of six measures essential for handling the situation

and also for protecting the interests of the country in future controversies of a similar nature. Briefly these measures were: 1. Enlargement of the Interstate Commerce Commission. 2. An eight-hour law for employees engaged in operation of trains. 3. The creation of a commission to study the effect of the eight-hour day. 4. An expression of "explicit approval by Congress of the consideration by the Interstate Commerce Commission of an increase in freight rates" if facts justify it. 5. The adoption of a law similar to the Canadian Industrial Disputes Act which would make railway strikes unlawful pending the outcome of a government inquiry. 6. A measure giving the President power to operate the railroads and draft employees into service if military necessity should require it.

In stating his reasons for legislating on the matter, the President mentioned that the men refused to arbitrate, the railroads would make no concessions, and a strike which would bring calamity to the whole country was imminent. Also, he contended, the spirit of the time and recent economic experience favor the eight-hour day.

*Adamson Law.* But only two of the proposed measures were enacted into law. On August 30th, a bill embodying the President's recommendations in regard to the eight-hour day, and the commission of investigation was introduced by Representative Adamson of Georgia, chairman of the Interstate Commerce Committee of the House. Next day a hearing was held at which the representatives of the brotherhoods spoke in favor and the representatives of the railroads opposed. However, it was passed by both Houses and signed by the President, and marks a new step in the settlement of labor controversies. The law provided that after Jan. 1, 1917, "eight hours shall, in contracts for labor and service, be deemed a day's work and the measure or standard of a day's work for the purpose of reckoning the compensation" of employees engaged in operation of trains. Further, it required the President to appoint a commission of three to investigate the operation of the law for a period of six to nine months and to make a report to the President. Opinion in the country was sharply divided between those who held that the unions had scared the President and intimidated the country and those who held that the President had taken the best and only possible course under the circumstances. Candidate for the presidency, Charles E. Hughes, made an important campaign issue out of the manner of settlement and the importance of preserving the principle of arbitration.

In October President Wilson announced the selection of General George W. Goethals, Edward E. Clark of the Interstate Commerce Commission, and George Rublee of the Federal Trade Commission as the board to investigate the workings of the eight-hour law. This board must report to Congress not less than six months nor more than nine months after the eight-hour day goes into effect. The railroads are forbidden by the law to reduce wages until 30 days after the presentation of the report of this board.

*Constitutionality.* The railroads at once made preparations to test the constitutionality of the Adamson Law. The Missouri, Oklahoma, and Gulf Railroad Company sought in the United States District Court of Kansas City an injunction

tion against the enforcement of the law. On November 22nd, Judge Hook of that court declared the law unconstitutional, but his opinion was hastily rendered in order to get the case speedily before the Supreme Court. The matter was to be argued before this latter court in January. Meanwhile both railroads and men perfected elaborate organizations to carry on the contest. The railroads were supported by a large number of industrial concerns organized in the National Industrial Conference Board; while the 400,000 trainmen involved in the original dispute were supported by 300,000 others and by the American Federation of Labor. The railroad spokesmen announced that they "would fight to the end," while W. G. Lee, head of the Brotherhood of Railway Trainmen, retorted that "a strike vote is still in effect," and President Gompers of the American Federation of Labor declared that "whatever steps the railroads may take to kill the Adamson Law, that law is going into effect on January 1st, and it will be enforced." There thus appeared prospects of a huge industrial contest in 1917. Toward the end of December a conference of managers and union officials took place in New York City with a view to arriving at a working agreement pending the Supreme Court decision. The brotherhood chiefs demanded that the law go into effect on January 1st and remain valid regardless of the Court's opinion until the termination of judicial proceedings. About \$5,000,000 in wages per month were involved. The railway heads insisted that the law should not begin to operate until upheld by the highest court and announced that they had agreed with the Department of Justice to keep a full record of all excess pay due under the law after January 1st. The conference adjourned after only one and one-half hours' discussion without any agreement. The union leaders then on December 29th referred the situation to members.

*Compulsory Investigation.* In his address before Congress on December 5th President Wilson outlined his strike prevention proposal first suggested when the Adamson Law was enacted. He pointed out that provision for full public investigation of industrial disputes and the granting to the executive of power to operate railroads in time of war or other public necessity would, together with the undoubted power of the Interstate Commerce Commission to regulate rates, constitute "a programme of regulation, prevention and administrative efficiency." He favored some modification of the Canadian Law requiring the compulsory investigation of industrial disputes before a strike or lockout may be legally declared. He carefully distinguished between compulsory investigation, which would prevent the cessation of industry while the facts were being made clear to the public, and compulsory arbitration which would force employees to remain in a position of employment against their wills. He said, "To pass a law which forbade or prevented the individual workman to leave his work before receiving the approval of society in doing so would be to adopt a new principle into our jurisprudence which I take it for granted we are not prepared to introduce. But the proposal that the operation of the railways of the country shall not be stopped or interrupted by the concerted action of organized bodies of men until a public investigation shall have been instituted which shall make a

whole question at issue plain for the judgment of the opinion of the nation is not to propose any such principle. It is based upon the very different principle that the concerted action of powerful bodies of men shall not be permitted to stop the industrial processes of the nation—at any rate, before the nation shall have had an opportunity to acquaint itself with the merits of the case as between employee and employer, time to form its opinion upon an impartial statement of the merits, and opportunity to consider all practicable means of conciliation or arbitration."

This proposal aroused most bitter opposition on the part of labor leaders and socialists and most enthusiastic support from employers and the public press in general. Most of the former refused compulsory investigation with compulsory arbitration. Thus President Gompers of the American Federation of Labor said, "Involuntary service can not be enforced under the Constitution of the United States. You may make strikes illegal and may make them criminal, but you are not going to avert strikes when strikes are necessary in order to express the needs of America's workers for a higher and better consideration of their rights." Other similar comment declared the proposal "a blow at the vitals of organized labor," "enslaving labor," as only a preliminary to "continuous trouble and slavery." On the other hand, the public press in general praised the proposal as an absolutely essential step in preventing future holdups by organized labor and as laying the basis for intelligent public judgment on industrial disputes of vital interest to the business and welfare of the country.

*RAILROAD SWITCHMEN.* The Switchmen's Union of North America early in the summer demanded an eight-hour day, an advance in wages and overtime pay at time and one-half, the demands being submitted to 13 railroads. Six thousand men were immediately affected, but 60,000 switchmen were indirectly interested. On August 7th the Union and the Conference Committee of the Railways agreed to submit the dispute to arbitration under the Newlands Act. In addition to their own representatives Judge Charles B. Howry of Washington and Prof. J. W. Jenks of New York University were named neutral arbitrators. Public hearings were held from November 13th to December 8th. The award granted an eight-hour day, an increase of pay of five cents an hour, payment for overtime at usual-time rates, and made minor regulations regarding time and payment.

*THE BOSTON ELEVATED RAILWAY COMPANY.* The following provisions were the chief ones in the articles of agreement between the Boston Elevated Railway Company and the Amalgamated Association of Street and Electric Railway Employees of America. 1. All differences which cannot be mutually adjusted by committees to be referred to boards of arbitration composed of one member chosen by the company, one chosen by the association, and a third selected by these two. 2. Employees not to be discriminated against because of membership in the association. 3. One day off in 15 to be granted upon request. 4. All employees guaranteed not less than six and one-half hours' pay provided they remain on duty as long as required not to exceed 14 hours. These articles are effective for three years from May 1, 1916.

PROTOCOL OF HART SCHAFFNER AND MARX COMPANY AMALGAMATED CLOTHING WORKERS. This new agreement superseding the one of 1911 was made April 14, 1916, and is to run for three years. It provides for a preferential union shop, a trade board consisting of a representative of each side with an impartial chairman for adjustment of grievances, and an arbitration board as a court of last resort. It retains all the essential machinery of the old agreement. A reduction was made in working hours from 52 to 49 a week, and there was a 10 per cent increase in wages. A minimum wage of \$9 a week is fixed for women apprentices and \$12 for men. In order to avoid abrupt changes in establishing these standards, the increases are to take effect progressively in from three months to two years. A characteristic feature of the settlement is that the 10 per cent increase is not to apply without distinction to all employees, but at the request of the union the greater proportion is to go to those receiving the least wages. Wage increases thus ranged from 20 per cent for the poorest paid to 5 per cent for the best paid.

COLORADO COAL COMMISSION. This was a Congressional body appointed to deal with the labor disturbances in the Colorado coal fields during the year 1914-15. It submitted its report to the President in April. The report reviewed the general conditions in the Colorado coal mines with special reference to arbitration and conciliation, the checking system, and the discrimination against trade union members. The report pointed out that the fundamental causes of unrest had been greatly modified by the enactment of State laws creating an industrial commission with large powers, providing workmen's compensation, and permitting the formation of mutual insurance companies to carry such compensation. Moreover, laws were enacted providing that checkweighmen be selected and paid by the coal miners themselves. In addition the Welfare Plan of the Colorado Fuel and Iron Company which was put into operation Oct. 1, 1915, greatly affected the underlying conditions because it regulated by contract many of the relations of employees to the company. The new State Industrial Commission was given powers of compulsory investigation, very much after the manner of the Canadian Industrial Disputes Investigation Act. Either a strike or a lockout is forbidden during 30 days pending investigation; but while the Canadian Law is limited to "industries affected with a public interest" the Colorado law applies to all industries whatsoever. Under the welfare plan each employee is guaranteed the right to belong to a union or not, as he pleases; men in each mine may choose their own representatives in carrying out an elaborate scheme of mutual coöperation of company and employees; and each employee is given a right to appeal from his immediate foreman to higher officials up to the president of the company. This right of appeal was found to greatly lessen the arbitrariness of local officials. Moreover, employee representation on four joint committees, dealing with industrial coöperation and conciliation, safety and accidents, sanitation and housing, and recreation and education, has greatly lessened antagonism toward the corporation.

NORWAY. By a law of June 9, 1916, the royal authorities of Norway are permitted to compel

arbitration of such disputes as involve matters of grave public concern. But such authority is to continue only so long as the European war lasts. The Arbitration Act of Aug. 6, 1915, already secured compulsory investigation of labor disputes, incorporation of associations of employees or employers, and the legal recognition of collective agreements. Originally this act had been a compulsory arbitration law, but was defeated by opposition on the part of both employers and employees. Under the new law, conditions of work, hours, and wages must continue unchanged pending reference to arbitration; and the determination of the arbitration court takes the form of a collective agreement which becomes a definite legal contract of employment. Hence a strike for determining the application of a collective agreement becomes illegal. No agreement is to remain in force longer than three years unless both parties stipulate otherwise. The court established under the new law consists of a chairman and four associates with alternates for the latter. The national associations of employees and employers are equally represented by these associates, while the Crown appoints the chairman.

SWEDEN. A report of the Labor Department published in 1916 presented a historical review of industrial disputes in Sweden, analyzed the principles involved in legislation for settling disputes, and made proposals for a new law. It arrived at the conclusion that compulsory arbitration in Norway, Australia, and New Zealand was not sufficiently successful to warrant final judgment. The proposed law would increase the authority of conciliators and make possible the enforcement of arbitration awards in certain cases. It strongly favored collective agreements to be in force from one to five years and having the quality of legal contracts. The law provided that during the continuance of a collective agreement a strike or lockout would be prohibited. The principle of compulsory investigation was adopted in the prohibition of strikes unless at least seven days' notice had been given; and also for two days after notification by a conciliator of his purpose to intervene. A special arbitration tribunal of seven members including employers' and employees' representatives and appointed by the Crown was proposed. The law would become applicable Jan. 1, 1918.

**ARCHÆOLOGICAL INSTITUTE OF AMERICA.** In conjunction with the American Philological Association and the College Art Association of America, the Archæological Institute held its eighteenth general meeting at Washington University, St. Louis, December 27-30, 1916. F. W. Shipley was re-elected president and Mitchell Carroll general secretary. John Williams White and Francis W. Kelsey are honorary presidents. At a joint session Mr. Shipley presided and the president of the Philological

Association, Prof. Carl Darling Buck, presented a paper on "Comparative Philology and the Classics." At other sessions the following presided: Charles C. Torrey, chairman of the managing committee of the American School in Jerusalem; William H. Holmes, chairman of the managing committee of the School of American Archaeology; John Picard, president of the College Art Association; and Andrew F. West, chairman of the School of Classical Studies of the American Academy in Rome. Among others, addresses were made by Ellsworth Huntington on "The Relation of Climatic Changes to Archaeological Studies"; Charles C. Torrey, "The Art of the Hairdresser in Ancient Babylonia"; Herbert Richard Cross, "The Study of American Art in American Colleges"; John Adams Scott, "The Close of the Odyssey"; Paul Shorey, "Illogical Idiom." The president, in his annual report, discussed the effect of the European war upon schools supervised by the Institute. The American School for Classical Studies at Athens had but one student in residence, but most of the staff remained in Greece conducting scientific investigations. The School for Oriental Research in Jerusalem will be discontinued until the end of the war. The American School of Classical Studies in Rome, which when amalgamated with the American Academy in Rome passed from the control of the Institute, is to be related to it again by a new joint advisory council.

The School of American Archaeology at Santa Fé has developed greatly within the last year. The director collected and installed an important archaeological and anthropological exhibit at the Panama-California Exposition at San Diego. The State of New Mexico raised its annual contribution to the Museum of American Archaeology from \$5000 to \$10,000 and gave \$30,000 toward the erection of a \$60,000 Art Museum building. A Museum of Ethnology has been established at San Diego and will utilize certain of the permanent exposition buildings. At the end of 1916 the property of the School was valued at about \$500,000. During the year excavation or studies were made on the Pajarito Plateau (by the director, Edgar L. Hewett), in Chaco Canyon, in the Rito de los Frijoles (Frank Springer), in the Manzano district (J. L. Nusbaum), at Pecos (Dr. A. V. Kidder), and at Otowi (Dr. L. L. Wilson).

After ten years as editor-in-chief of the *American Journal of Archaeology*, Prof. Harold North Fowler is to retire. In 1916 another periodical published by the Institute, a nontechnical archaeological magazine called *Art and Archaeology*, was converted into a monthly and largely improved. The treasurer reported an excess of receipts over expenditures. The membership is about 3000. The following deaths were announced: Seth Low, second president and later honorary president of the Institute; Horace Davis, founder and a president of the San Francisco Society; Eckley B. Coxe, Jr., president of the Pennsylvania Society; Lucius M. Cuthbert and Joel F. Vaile, president of the Colorado State Society.

**ARCHÆOLOGY.** The continuation of the European war has prevented archaeological investigation to any considerable extent.

In Egypt, however, which is somewhat aloof from the turmoil of war, several sites have been examined. At Gebel Barkal, Reisner has been at

work upon the pyramids located at that place. The excavations betrayed the fact that they were always so located that their approach faced the river. Unfortunately these funeral monuments had been visited and plundered in antiquity, so that little remained to tell their story. Fragments of pottery, however, made it clear that these buildings are of Meroitic date. On the same site, also, much work was done on the temples. The earliest work done upon these temples is that of Thothmes III. This is followed by that of Thothmes IV and Rameses II. In all cases the information is afforded by sculptural remains. After Rameses II there occurs a long gap, in which no kings are mentioned, until Tirhakah and the succeeding, less known, Ethiopian rulers. One Meroitic king left a conical sandstone block covered with sculptured necklaces and other ornaments. This stone is believed to be the decorated omphalos of Ammon. This king, Manach, by name, had as well the prænomen Nebmare, which belongs also to Amenhotep III.

At Memphis the Coxe Expedition has been busy. Here close to the temple of Meremptah, the investigators discovered a large palace. This find is of importance, since very few palaces have been discovered so far and our knowledge of Egyptian domestic architecture is very limited. This is the first structure of its kind to be found at Memphis. The palace was originally about 180 feet in length and about 100 feet broad. In it were twenty or more rooms of different sizes. Apparently the building had been attacked by fire, for several of the rooms show traces of scorching. In what is thought to be the throne room many valuable finds were made. Among these may be mentioned a bronze which evidently once belonged to a chariot, a number of bronze lamps, gold earrings, and necklaces. Along with these were many scarabs, and since some of these objects go back in time to the sixth dynasty the inference to be drawn is that the owner of the palace must have been a collector of antiques. Particularly interesting was the discovery of several doorways which were executed in the finest style of architecture; one of these was inlaid with a kind of faience; another was similarly treated with gold.

At Abkah, in Nubia, the expedition of the Peabody Museum discovered a number of early dynastic burials of the usual sort. One or two new characteristics appeared. Thus one of the burials showed a body with a cloak of feathers over the shoulders, while another showed a body with a feather headdress upon the head. Not far from these archaic interments were discovered three or four graves dating from the New Empire. One of these burials, for example, contained a good specimen of black-topped pottery, associated with the usual pottery of the New Empire. Near Gammay, about 2 miles distant from Abkah, were found extensive predynastic cemeteries of late date. These had been thoroughly rifled. Near the river was discovered a small Meroitic cemetery (Romano-Nubian) from which five excellent classic bronzes were recovered. Part of this cemetery was covered by pagan burials of the third and fourth centuries of the Christian Era.

At Thebes the expedition of the Metropolitan Museum of Art has been working upon the tomb of Pu-im-rê. The rock roof and walls had collapsed in ancient times, breaking into bits the

reliefs which had decorated the tomb. Several hundreds of these fragments have been recovered and in many instances preserve the original colors in an almost perfect condition. In the sunken court of the "Biraba" most of the coffins had been riddled by white ants. However, a large number of bronze vessels, toilet utensils, weapons, scarabs, pieces of musical instruments, and a foundation deposit of the time of the Rameses were recovered.

At Thebes, also, Ernest Mackay, acting for Mr. Mond, discovered two tombs which had been lost sight of since the time of Lepsius. One of them was the tomb of Nebenkême, a military officer who lived in the time of Thothmes III and Amenhotep II. The other tomb was that of a counter of the grain of Amûn. The name of this official, however, had been erased when at a later date the tomb was used by Mahu, an official high in command in the Ramesseum.

**AFRICA.** Several Christian tombs have been discovered at Carthage. In one of them was found a marble sarcophagus which contained the body of a woman richly adorned with jewels. Among these jewels was an emerald and ruby necklace with clasps of uncut precious stones. Besides these were heavy gold pins, buckles, and rings, as well as other valuable objects which were sewn on the garments.

**GREECE.** The excavation of the American school last spring at Corinth brought to light some interesting prehistoric vase fragments. Among these may be mentioned some fragments that unquestionably were brought from Crete, particularly a very fine pitcher of Late Minoan I or Early Minoan II style. Besides these there turned up some cups with Late Minoan I designs done in the regular excellent Mycenaean technique but not of Cretan origin. This is a new ware and appeared in only two or three instances at Tiryns. At Hexamitia the same school found some neolithic, dull-painted ware in connection with very little Mycenaean.

About 150 feet outside the citadel wall of Tiryns was found a copper kettle, a copper tripod, a fine piece of the same metal covered with reliefs of birds and animals, a copper plaque, swords, brooches, and potsherds. The kettle proved to be a veritable treasure house, for in it were 500 gold beads, gold wires upon which in all probability the beads had been strung, several plaques of gold, studded with jewels, pieces of conical-shaped money, a number of amber beads, a golden wheel with spokes of amber, and a tube stamped with hieroglyphics. Most important of all in the find were some gold rings. Of one of these the setting is engraved with a boat from which several persons are disembarking, while four men and women on shore wait to greet them. The bezel of another shows a goddess seated on a throne while four lions bring offerings to her. In the background is a tree on which is a bird. Behind the tree appear the sun and the moon. These objects date about 1200 B.C.

In Northern Greece several finds have been made in the territory now within the war zone. At Lake Langaza in the Balkans a tomb of classic times was found. It contained a skeleton adorned with objects of bronze and gold. At Salonika, or rather in the vicinity, many antiques have come to light in the course of digging the trenches. Among them may be men-

tioned gold and bronze rings and incised geometric pottery. On the site of Pella French troops have found statuettes, vases, and marble stelæ. This, it will be remembered, is the site made famous by Philip.

At Koráko, some three kilometers to the west of New Corinth, the American School conducted excavations for six weeks during the summer of 1916. The site lies on a low bluff just above the Gulf of Corinth. Test pits demonstrated the fact that the hill is covered to a depth of four to five meters with the debris of successive prehistoric settlements. Several foundation walls of stone bedded in clay, and several layers of clay (originally sundried brick) show as many as eleven superposed strata of occupation of the site. Three periods are easily characterized by the remains of pottery. The first is represented, in the two to two and one-half meters of deposit above the bed rock, by so-called *urfirnis* ware. This ware is hand made and either unpainted or varnished or monochrome decorated ware. A typical form of the first class is that of a straight-sided flaring bowl, and this type of ware differs from that of the second group only in lacking the thin varnish-like slip which appears in the latter. The second group is represented by more fragments and has as a characteristic form a shape somewhat like a wine-skin. The monochrome ware, well-made, shows red or black surfaces, on one of which patterns are picked out in dark paint on the light ground.

This primitive period, which runs from about the end of Early Minoan I period to Middle Minoan II, came to an end with a fire which left a thick bed of ashes. Immediately above this appears a second layer of deposit from one to about one and a half meters in thickness. This is characterized by the predominance of Minyan pottery. This ware is wheel-made of a fine gray clay with a smoothly polished surface of a soapy feel. This is never painted but is sometimes decorated with incised lines filled with white material. The shapes are graceful and seem imitated from metal or stone ware. This is probably an imported ware.

Along with this Minyan ware occurs a dull-painted, pre-Mycenaean geometric. The shapes are pithoi large jars, bowls, and basins and vary from coarse to fine ware. The decorations become polychromatic in the later phases. One of the pithoi contained the skeleton of a child.

This period, which extends from Middle Minoan II to Late Minoan I, passes over suddenly into the third period, which is Mycenaean in character.

The third period deposit reaches down from the surface of the ground for about 1.20 m. It shows four levels of occupation, and from it a vast quantity of Mycenaean pottery was recovered. One pit alone produced over nine thousand fragments. From these some hundred vases dating from the Middle Minoan III to the Late Minoan III period were reassembled. A number of fragments belong to Cretan importations.

From this stratum of deposit a new type of Mycenaean ware was recovered. It has arbitrarily been called "Ephyraean" and belongs in the latter part of the Late Minoan I period. It seems to be confined to one shape—a deep two-handled goblet with a low shank—and the clay varies from buff to yellowish-green. The

ware is glazed in and out with a buff or greenish slip, on which Late Minoan I designs are painted in red (on buff ware) and black (on yellow or greenish). The decorations are more often lilies or rosettes or spirals. One large flower usually appears on each side of the vase.

In the first period the foundation walls show the stone laid in clay for mortar and numerous indications of the employment of sundried brick were at hand. No complete house has yet been excavated. In the second or Minyan period, however, a dwelling has been cleared. It measures about 11.40 m. by 4.50 m. The southern front is rectangular, the north apsidal. The foundation consists of walls about .30 m. thick made of small stones bedded in clay. In this foundation rested the house walls of sun-baked brick. The internal arrangements show two cross walls, one of which shuts off the apse while the other, near the southern end of the house, makes a room at this end about 2 m. wide. This may have been a vestibule. In the central room, which is about 6.20 m. long, is the hearth. There are no indications of columns, as at Tiryns, to support the roof. From this room a door opened out to the west. The floor was packed with earth.

The clearing away of a large portion of the top of the hill brought to light a large number of foundation walls of the Late Minoan III period. The plan of six houses can be made out of the complex. From these it has been determined that the ordinary house of this time at Koráko was a long rectangular building. At one end was the entrance which led into a vestibule, which in turn opened into a large room—the megaron. Near the centre of this is a hearth with a column-base near by. This may have supported a "baitylon" with which the family worship was associated. Behind the megaron are sometimes one sometimes two rooms, each with a hearth. In one instance at least to judge by vase fragments, these rooms may have been kitchens.

A few trial pits sunk at Giriza not far from Hexamilia showed fragments of vases from the *urfirmis* period. The finds show that this period was of long duration.

ITALY. At Bettona, ancient Vettona, work has been done on an Etrusco-Roman tomb which dates in the third century before our era. The tomb, a splendid example of massive stone work, has a chamber which measures 7.86 meters by 4.25 meters. The floor is arranged with a series of steps which give an amphitheatral effect. From the excavations a number of earrings, bracelets, and rings were recovered. One of the latter shows a cameo carved with a beardless male head in profile. At Caere, modern Cerveteri, a cemetery street has been explored. The tombs, which belong after the fifth century B.C., are located side by side upon this street. The Italians have also continued their work on the Via dell' Abondanza at Pompeii. The house of Trebio Valente has also been excavated. In the peristyle of this building were found the skeletons of four persons. In Rome in the Via Labicana the *Casa Rossa* has been partially excavated, with the result that several rooms have been laid bare. One of these measures 7.75 meters by 5.8 meters and is paved with mosaic. In the same city also some interesting funeral monuments have come to light at the end of the Villa Volkonski-Campanari, between the Via S.

Quintano and the Via Santa Croce di Gerusalemme. The burial chambers, which were vaulted, still contained the ashes of the dead, preserved in urns. Portraits of the dead appeared in reliefs which also carried inscriptions and names of freedmen of the *Gens Quinta* and *Clodia*. The inscriptions forbid the use of the tombs by succeeding generations. In the island of Sardinia excavations have been carried on at Laerru upon the tumuli and "tombs of the giants." At Vignanello, in Etruria, the town and the necropolis have been excavated. One of the tombs opened was perfectly preserved, although the vases found therein were badly broken. The *dromos* of the tomb was 14 meters long and 1.28 meters wide. The tomb contained potsherds dating from the sixth to the third century B.C. Among the finds was a kylix in the style of Charchrylion and a stamnos of the severe red figured style of vase painting. In tomb III was found a fine tripodic bronze candelabrum.

**ARCHBOLD, JOHN DUSTIN.** An American capitalist, a leader in the oil industry of the country, died at Tarrytown, N. Y., Dec. 5, 1916. Of Scotch-Irish ancestry, he was born in Leesburg, Ohio, in 1848, was early a clerk in a general store, and as a youth went with his parents to Titusville, Pa. There he became identified with the Acme Oil Company, and rose in it to a position of influence. The company was considered the bitterest enemy of the South Improvement Company, which developed into the Standard Oil Company, with the Rockefeller interests behind it. John D. Rockefeller became impressed with young Archbold's initiative and ability, and secured his services. From that time, 34 years ago, he had grown steadily in importance as a dominating force in the corporation. When the Standard Oil Company was dissolved in 1911 through government action, Mr. Archbold was its vice-president. In the reorganization then effected he became president of the Standard Oil Company of New Jersey, the most important of the new units. Mr. Archbold came before the public in several striking situations. He seemed to be the chief fighting man of the Rockefeller forces, and was never unwilling to take the stand in vigorous defence of the methods employed in the oil industry. In 1912 letters which, he claimed, had been stolen from his files and sold, were published by William Randolph Hearst. They apparently showed close relations between Standard Oil and several prominent politicians, including Senator Joseph B. Foraker of Ohio. Within the same year, a tilt occurred between Mr. Archbold and Theodore Roosevelt, the former asserting that Mr. Roosevelt, when a candidate for President in 1904, knew that the Standard Oil had contributed \$100,000 to the Republican national campaign. Mr. Roosevelt thereupon added Mr. Archbold to the membership of the Ananias Club. Mr. Archbold was president of the trustees of Syracuse University and gave large sums to that institution, including \$500,000 at his death. He left to his family a fortune of \$25,000,000, acquired wholly through his oil interests. He was buried in Sleepy Hollow Cemetery.

**ARCHITECTURE.** In the past year, which has been one of more than ordinary prosperity

MASSACHUSETTS INSTITUTE OF TECHNOLOGY  
LIBRARY AND ADMINISTRATION BUILDING  
William Welles Bosworth, Architect

for the United States, building has been active throughout the country. In the two years preceding, however, a great many building projects of major importance were carried on, as may be learned specifically from the reviews of ARCHITECTURE in the 1914 and 1915 YEAR BOOKS. Even during the time when conditions in Europe most acutely affected American business, the most conspicuous falling off in building operations took place in residential architecture. In other types of building it would be difficult to prove that conditions in Europe caused any significant difference in the projecting or completion of the normal and usual variety or importance of architectural undertakings.

In a brief review it is impossible to give complete lists of buildings or of architects. Specific buildings mentioned are given as typical examples in each case, and with due recognition of the impossibility of making such lists complete. In like manner the names of architects in certain cities or localities are given here for reference value and intended to comprise only the most conspicuous practitioners.

It has been an interesting practice of architectural critics to deduce from the completed work of a year or a decade various observations upon the growth of certain styles or certain schools of architecture. Accurate deductions of actual value are virtually impossible because of the nation-wide eclecticism of architecture in the United States. Despite the predominance of certain architectural styles in certain localities, it is always possible to see a country-house of Elizabethan "half-timber" derivation in Lower California, and a white-walled, tile-roofed "Mission" country-house at Newport, R. I. Our architecture is consistent only in its inconsistency, and it is rarely possible to trace "tendencies" which are either continuous for any length of time, or generally uniform in any given locality.

The following review, then, is designed to summarize the present degree of attainment which has been reached in the several types of building considered, as well as to record certain specific works of the year.

**EDUCATIONAL BUILDINGS.** A year seldom passes without witnessing the completion of at least one architectural project of the first magnitude. The year 1916 can record the opening of the principal buildings of the great group designed for the Massachusetts Institute of Technology, by William Welles Bosworth, a graduate of the Institute, in the Class of '89. The impressive alignment of buildings on the Cambridge bank of the Charles River, across from the "Back Bay" section of Boston, declares at once the architect of Beaux-Arts training. The superficial aspect of the group shows a broad architectural intention, excellently carried out. Dignity, symmetry, and the classic ideal are the architectural fundamentals of the whole, and liberal funds have made it possible for the officers of the institution, and for the architect, to erect buildings essentially modern in every technical and mechanical detail of construction and equipment.

The centre of the group is marked by a domed building, with a splendid Ionic colonnade, not unlike McKim, Mead & White's immortal Columbia Library. Upon each side of this are symmetrically disposed the other buildings, which flank a great three-sided court, open to

the river front. The technology buildings are to be recorded not only as one of the most noteworthy of the world's educational groups, but as one of the finest of large architectural projects carried out in this country.

Colleges throughout the country yearly add a dormitory or a single building, but are seldom enriched by any such significant addition as the "Scholastic" Gothic Graduate School building, at Princeton, by R. A. Cram.

Work continues on the permanently important West Point group, on the Hudson River, one of the most remarkable achievements of the now dissolved firm of Cram, Goodhue & Ferguson, but in this group the entire scheme was laid out and agreed upon many years ago.

Like other architectural expression in the United States, collegiate architecture is consistent neither nationally nor locally. In several cases the "Harvard" type, of brick and stone, a Georgian Colonial style, prevails, while the buildings of Princeton, University of Pennsylvania, Washington University in Illinois, and Bryn Mawr College in Pennsylvania, show well-considered renderings of the English type of "Collegiate" or "Scholastic" Gothic architecture by Cope & Stewardson, Day & Klander, and other architects.

In the design of public schools, the names of two American architects stand out with merited prominence—W. B. Ittner, in St. Louis, Mo., and E. F. Guilbert, in Newark, N. J.

The past year adds further credit to the former's excellent work in school design, with the Barton School and the Lowry School (both in Minneapolis, Minn.). Local architects are often associated with Mr. Ittner, who is a specialist in schoolhouse design, and in Minneapolis, the firm of Stebbins & Haxby collaborated on both the above mentioned schools. Another new school, of unusually "homelike" appearance is the Mullanphy School, in St. Louis, Mo., also by Mr. Ittner.

The type of school developed to its present high degree of excellence and efficiency by Mr. Ittner, as well as by Mr. Guilbert, has set a type for modern schoolhouse design throughout the country. Essentials observed in the planning and construction of the modern school have been essentials of efficiency as resultant from plenty of light, scientific ventilation and heating, highest sanitary requirements observed throughout, and installation of the best of modern equipment for every department of every building.

In point of style, both Mr. Ittner and Mr. Guilbert, as well as their many followers, have adhered with excellent consistency to various modifications and adaptations of the English scholastic Tudor architecture, traditional from Gothic to Renaissance, and here modernized to a degree of ready appropriateness to the expression of the American school building of to-day.

An important technical school building of the year is the Carter Harrison Technical High School, in Chicago, Ill., by A. F. Hussander, and Salt Lake City, Utah, has also seen the completion of a Technical High School, by Cannon & Fetzner. The style, in the latter building, shows a radical departure from the conventional, and a distinctly interesting expression of the "Modernist" or "Secessionist" type of architecture associated with Frank Lloyd Wright. The building is of brick, confidently handled in a

manner at once structural and decorative, with an introduction of symbolic architectural sculpture as commendable as it is unusual.

Many new school buildings have been erected in California in the past year, their design making up in individual merit, perhaps, what it lacks in the general consistency of the buildings as related to each other.

In general it is to be said that in few types of building has such remarkable advance been made in recent years as in public school buildings, which have become not only agreeable to look upon as works of architecture, but (even more important) as models of efficiency, sanitation, and modern equipment.

**HOSPITALS.** Parallel with the development of the modern school along lines of ever-increasing efficiency is the development of the modern hospital.

One of the most important large hospitals of the year is the New Mt. Sinai, at Cleveland, Ohio, by George B. Post & Sons. Since it is proper that by far the greater part of an expenditure on a hospital building (apart from its actual construction) should go into its equipment, the problem of designing the exterior has resolved itself, in the hands of the best architects, into a matter of creating the most pleasing and cheerful effect with the greatest economy and simplicity of means. Hospitals, as a result, have in recent years lost their former resemblance to second-rate State capitols or penal institutions, and have taken on a sane, suitable, and even inviting architectural guise.

A noteworthy example of the year is the hospital designed by York & Sawyer, of New York, for the United Benevolent Association, of Grand Rapids, Mich., and said to be one of the finest and most expensively equipped buildings of its type in the United States. The architectural style chosen was a happy one—a modified Italian Renaissance, carried out in a mellow-toned brick. Open Palladian loggias, agreeably breaking the wall-surfaces at various points, not only serve the purpose of stylistic expression, but afford ample out-door space for patients who require it. Several of these loggias are at a great height above the ground, so that even a hot day in summer would fail to rob a delicate patient of the best air.

**BANKS.** Few types of building seem less affected from year to year by the spark of inspiration than the bank buildings. Those completed in 1916 are indistinguishable from those of 1915, and those, again, from the year before. It would seem that our architects (or, perhaps, our bankers) had hit upon a decent and imposing ideal for a bank building, and were resolved not to depart from it on any account. The accepted type has much to recommend it, and also little to arrest or surprise the eye of the architectural critic. Each new bank is a variation of the same theme, with differences appearing chiefly as dictated by peculiarities of the site, or by the importance or prosperity of the institution. Each is a partial façade of a Greek temple (Doric, Ionic, or Corinthian), with fine plate glass and, perhaps, a bit of bronze grille-work between the columns. A bronze door admits to a marble-and-bronze interior, each remarkably like all the others, and all displaying a commendable uniformity in the expression of substantial dignity. Much excellent design, in detail, and much fine artisanship is apparent in

the typical modern American bank, and unless a departure from the existing type were obviously superior, we may well take satisfaction in the circumstance that our bank buildings are as architecturally seemly as those we see about us on every hand.

In several cities of the Middle West, however, one architect has designed and erected a considerable number of bank buildings which are not only unclassic in their character, but unlike any specific architectural style. One of these banks, to be recorded as of 1916, is the Merchants' National Bank, of Grinnell, Iowa, designed by Louis H. Sullivan. Mr. Sullivan will be remembered as the first of the Chicago school of architectural "Secessionists," and the originator of an essentially decorative kind of non-stylistic ornament, strangely interlaced and contrived—Oriental, yet not Oriental. This ornament, applied to architectural forms radically differing from all historic precedent, constitutes a distinct and personal contribution to the variety of architecture in the United States. By reason of its surprising and sometimes bizarre qualities, the writer has often regarded it as a strange choice for the architectural expression of a bank building, yet the most captious critic must admit that the results, as seen in a number of important bank buildings by Louis H. Sullivan, are peculiarly pleasing, and undeniably interesting. It may be that they would be less pleasing if encountered in a more conservative community, surrounded by old precedents, while they possess a remarkable architectural spontaneity and freshness in the open-minded and progressive Middle West.

**LIBRARIES AND MUSEUMS.** For the most part, the architectural character of public libraries and museums varies but little, and differences are apparent chiefly in the degrees of merit evidenced by the architect's rendering of an adapted Classic theme.

The most notable building of 1916, in this category, is the Cleveland Museum of Art, Cleveland, Ohio, by Hubbell & Benes. The treatment, as agreeably familiar as it is suitable, makes use of the Greek Ionic order, in a gracious and dignified building of white Georgia marble.

An unusual library building is seen in the Haddington Branch of the Philadelphia (Pa.) Free Public Library, by Albert Kelsey. Here the architect, abandoning the familiar Classic colonnade idea, skillfully blended the local brick-and-stone Georgian Colonial architecture of Philadelphia with an element of modified Italian Renaissance. The result proved pleasing and unique interest was added to the building by the introduction of much symbolic detail, especially in the polychrome glazed terra-cotta soffit of the main entrance arch.

A successful small library at Needham, Mass., by James H. Ritchie, is typical of a recent and highly commendable tendency in most of the older eastern communities of the North Atlantic States. This tendency is toward the use of carefully studied versions of the Georgian Colonial style for small libraries, town halls, churches, and other buildings of public or semi-public nature. Even banks in some small New England towns have been made to most agreeably recall the more substantial and time-honored style of local prototypes, worthily perpetuating our only architectural heritage.

AMERICAN SCHOOL ARCHITECTURE, 1916  
William B. Ittner, Architect

**HOTELS AND APARTMENT HOUSES.** The erection of large and ultra-magnificent hotels seems to keep pace with the business growth of our larger cities, and the last decade has witnessed the opening of an astonishing number of these remarkable and essentially American buildings.

The hotel as a human and mechanical organism of efficiency and service has been developed to a high degree in this country, the United States, indeed, having devised more conveniences and inventions in hotel equipment than any other country. Hotel building in the United States, moreover, has been practiced on a larger scale than in Europe, with the result that several interesting architectural developments have taken place.

A brilliantly superficial "style" (or composite of style) has been created for the definite purpose of attracting guests, for pleasing and amusing them after they have been attracted, and for subtly flattering them while they are beneath the hotel's roof. Hence the diversity of styles seen in a single hotel, the special rooms carried out in such unusual schemes as mediæval monastery wine-cellars, Assyrian throne-rooms, Pompeian villas or whatnot. There is no thought that any of these may be in even a remote stylistic relationship with the eighteenth century Franco-American exterior—the intention is solely to attract and amuse a novelty-weary public. The opening of the Ritz-Carlton and Vanderbilt hotels in New York City (1911 and 1912; Warren & Wetmore, architects) ushered in a new ideal for hotel architecture, and one which has widely influenced hotel design and furnishing ever since, governing it, for the most part, to-day. Ornate French styles, as well as more restrained French styles, were abandoned in favor of the eighteenth century English style of the Brothers Adam. Plain wall-surfaces took the place of walls of ornate marble or decoration; Adam, Hepplewhite, and Chippendale furniture took the place of French furniture, and to this there was added that eighteenth century English decorative curiosity called "the Chinese taste." The results of the radical change in style, as exemplified by nearly a score of recent hotels, are most pleasing, and it seems as though a better expression of *good taste* in hotel architecture had been achieved without any loss of superficial attraction.

Several large hotels were opened in 1915, and 1917 will see the opening of two large hotel projects now in building progress—the Pennsylvania Hotel, by McKim, Mead, & White, on Seventh Avenue, New York City, close to the great Pennsylvania Railroad terminal, and the Hotel Statler in St. Louis, Mo., George B. Post & Sons, architects, with Mauran, Russell & Crowell, associated. The latter hotel, uniform with the hotels Statler in Buffalo, Cleveland, and Detroit, will be of an architectural character embodying traits of several styles, but exemplifying no one. There will be found some Italian elements, some of the eighteenth century English Adam style, and some connoting Georgian Colonial inspiration. The composite is an agreeable one for modern hotel architecture, and bids fair to hold in favor for some time to come.

An important hotel of medium size, designed in this general vein, is the Robert Treat Hotel, opened in 1916 in Newark, N. J., Guilbert & Betelle, architects

The design of apartment houses, confined, naturally, to cities of such size that artificial housing conditions exist, has shown progressive improvement in recent years. This improvement is evidenced not only in the more attractive superficial appearance of the buildings, but in their planning, construction, and equipment.

Typical of the finest type of apartment house building in New York City, in the year past, is the Astor Court Apartment Building, by Charles A. Platt. Like several earlier apartment buildings by the same architect, Astor Court is designed in a skillfully modified Italian Renaissance, dignified and urbane. Many less pretentious apartment houses have taken the hint from good examples about them, and present a degree of merit which is becoming the rule to-day, instead of the exception of a few years ago.

It seems that owners and operators of valuable real estate are now convinced that "good architecture" is a "good investment," instead of a waste of money. "The Apartment House Medal," awarded each year by the Architectural League of New York for the best design of that year, has done much to direct interest and attention toward the question, not only on the part of the architects, but of the owners and building promoters.

In the Middle West, apartment house design of the year past shows a tendency to depart from stereotyped architectural conventions, and to express a new freedom, together with a certain clever "externality" which may or may not be a good sign. The "St. George" Apartments, in Chicago, Ill., by Norman E. Brydges, is typical of this newer conception of the problem—a conception undeniably attractive even though accepted on probation by the conservative critic.

On the Pacific Coast remarkable success has been attained in the design of "garden apartment houses," by such architects as Irving J. Gill. Here, where land is not at a great premium, rows and groups and blocks of white-walled houses are picturesquely disposed about luxuriantly flowering courtyards, or stepped quaintly up a terraced hillside, with a profusion of vines and planting making them, indeed, "garden apartments," and one of the most unique and engaging of current architectural innovations in the United States.

**RESIDENTIAL ARCHITECTURE.** In no type of building is the stylistic selection of both architect and client so apparent as in the American country house. Critics, having long since abandoned hope of detecting or pointing out any "American style," are now more profitably engaged in studying the varied architectural expression seen in country house architecture as a matter of "derivations."

In so brief a review it is possible only to point out the more conspicuous tendencies apparent in certain localities, with an enumeration of the architects whose beliefs and works to some extent are influential or dominating in these localities.

The most consistent local expression of American domestic architecture is to be observed in Pennsylvania, in the works of a group of architects whose offices are in Philadelphia, and who erect buildings within a considerable radius thereof.

The most conspicuous influence to be discerned in this group comes from Wilson Eyre

(now in the firm Wilson Eyre & McIlvaine), and from Frank Miles Day, in the firm of Day & Klauder. Other Philadelphia architects to be noted for admirable country house work are Cope & Stewardson, D. Knickerbocker Boyd, John T. Windrim, Mellor & Meigs, Duhring, Okie & Ziegler, Edmund B. Gilchrist, Charles Willing, Savery, Scheetz & Savery, and Furness & Evans. Wilson Eyre developed and still practices a style which combines the picturesque elements of the English country house, both old and new, with local materials and modern American needs. Evidences of his influence are apparent in the works of nearly all the Philadelphia architects. Skillfully blended with this picturesque type of domestic architecture, or carried out alone, is a fine revival of early local types of Colonial farm houses. Philadelphia architects of large and monumental projects are Horace Trumbauer, Albert Kelsey, and Edgar V. Seeler, the last named being the architect of the large building completed in 1916 for the Penn Mutual Life Insurance, on Independence Square, diagonally across from the great Curtis Publishing Plant, an earlier work of the same architect.

Observation of work in the vicinity of New York discloses no consistent effort toward any one type of expression in domestic architecture. Able architects too numerous to list have been busy in the year past, in residences for both town and country, many of these of great magnitude, and representative of great expenditure. Most notable, perhaps, are two large country houses by John Russell Pope, one for Mr. Ogden L. Mills at Woodbury, L. I., the other for Mrs. Arthur Scott Burden at Jericho, L. I. Two similar houses of the year, of equal importance, are for Mr. G. Hewitt Myers at Washington, D. C., and for Mr. J. S. Frick, at Baltimore, Md. In all four of these large country houses the architect has employed an adaptation of the Adam style in a manner professionally interesting and superficially attractive. Charles A. Platt continues to occupy his place as the American architect preëminently master of the adapted Italian villa, though each year witnesses marked advances in the sympathetic rendering of the type by others. A notable "Italian villa" completed in the past year is the house and gardens for Mr. H. H. Rogers, at Southampton, L. I., by Walker & Gillette, architects. No published work has appeared in the year past from the offices of Harrie T. Lindeberg or Aymar Embury II, both of whom are noted as the designers of highly successful American country houses.

The region of New York, however, affords no opportunity for a descriptive summary because of the wide diversity of stylistic expression, and even a lengthy enumeration could develop no conclusions differing in any way from conclusions which might be made the preceding year, or earlier years.

Architects in the South appear to have developed no distinctive convictions regarding domestic architecture, for we find no publication of conspicuous examples, nor any evidence of the influence of any one leading spirit. Each year there is a considerable amount of building in the South, but no great architectural achievements. The most interesting one which has come to the writer's attention is a great palace which is called a "ranch house" on a million

acre ranch near Kingsville, Texas. Perhaps the most interesting feature of this Santa Gertrudis ranch house (Adams & Adams, architects) is its fireproof construction, and the scale of the entire establishment, farm buildings, etc., of which it is a part.

Domestic architecture in the Middle West, centering about Chicago, has for many years presented a great quantity of lively material for study and observation.

Roughly speaking, the influence is a dual one, and part of each year's output shows the exuberance of the "Secessionists," the other part the earnestness of the "Conservatives." In the forefront of the Secessionists is Frank Lloyd Wright, and other architectural "free-thinkers" whose works are numerous are William Drummond, Von Holst & Fyfe, Tallmadge & Watson, and George W. Maher.

The most important Conservative, an architect of extensive practice and remarkable versatility, is Howard Shaw. Despite the fact that architectural radicals have for some years made active efforts to develop a distinctive type of Middle Western domestic architecture, each year sees the erection of a far greater proportion of houses in all respects similar to those of the East.

The development of a characteristic type of American country house in California is favored by its peculiar climate, its Spanish mission precedents, and its distance from distracting outside influences. There are several distinctly Californian types, notably that derived from the Spanish missions, that developed from Japanese architecture, and a remote adaptation of the Swiss chalet. There are, as well, many notable examples of frankly adapted European styles, of which the Italian villa is the most appropriate.

The following architects are among the most able and prominent of the Pacific Coast: Bliss & Faville, Elmer Grey, Myron Hunt, Robert D. Farquhar, Willis Polk & Co., Lewis P. Hobart, Greene & Greene, L. C. Mullgardt, Irving J. Gill, and Arthur R. Kelly.

**CHURCH ARCHITECTURE.** The past year has not seen the erection of any epoch-making church edifice, unless we accord such a marked designation to the great Cathedral of the Immaculate Conception at Ferdinand, Indiana, by Victor J. Clutho. Here is an enormous Romanesque cathedral of brick, admirably handled in detail, and of immediately impressive mass.

The style of this cathedral reminds us that recent years have seen an increasing number of churches — especially small churches — designed in the Romanesque manner. It may, indeed, be a tendency which will go further, and cause the pendulum to swing (perhaps but temporarily) away from Gothic adaptations and back to the Romanesque, which was so ardently introduced in this country by H. H. Richardson in 1874.

The Romanesque style, perhaps, is more readily rendered to-day by the average American architect, than the Gothic style, and for this reason the increasing tendency noted above may be an excellent one.

Few American architects other than Cram, Goodhue & Ferguson (now practicing separately), have ever achieved really worthy Gothic buildings, considered as stylistic expressions, or even considered regardless of style.

American church architecture, taken during

the year past, or through previous years, reflects less distinction and credit on our architects than most of their other works, though of course there are happy exceptions, and always the exception of Cram, Goodhue & Ferguson. Certain important works from the hand of Mr. Goodhue are still incomplete, and Mr. Cram's work on the Cathedral of St. John the Divine in New York City is ever in a mutable state, aside from the finished work of a few years ago on the Deanery and several other subsidiary buildings.

On the Pacific Coast there have been erected a profusion of small churches, many of them very pleasingly and appropriately carried out in the style of the old Spanish missions. This style, by reason of its simplicity, seems to be particularly acceptable to the Christian Scientists, who have also made excellent use of a modified version of the Romanesque style. Among California architects who are distinguishing themselves in these types of modern American church design, mention should be made of Irving J. Gill, Elmer Grey, and Myron Hunt.

**COMMERCIAL ARCHITECTURE.** Great promise for some future day is to be read in the steady and rapid advance of a new architectural mastery of the exigencies of utilitarian structures. Within the recollection of all of us is the time when no thought or effort was expended upon factories—it was assumed at the start that a factory *could* not be beautiful, or even decent to look at, and little effort was made to upset this theory because of the coexistent theory that there was no reason why a factory *should* be good looking, even if it were possible to make it so.

Let us make a brief survey of the following important types of "utilitarian architecture": office buildings, stores, factories, and power plants. The design of the tall office building, originated in this country, has been variously (and for the most part, excellently) met by the ingenuity and resourcefulness of American architects, who can point with justifiable pride to such achievements (in New York City) as the Bankers' Trust Building, City Investing Building, Trinity Building, Woolworth Building, Equitable Life Building, and Metropolitan Building.

The most important tall office building of 1916 in New York City is the Postal Life Building, on Fifth Avenue at 43rd Street, by York & Sawyer, who are distinguished for their ability in designs of this kind.

Mention should also be made of the Heckscher Building, on East 42nd Street, New York City, Jardine, Hill & Murdock, architects.

An important insurance building was completed for the Northwestern Mutual Life Insurance Co., in Milwaukee, Wis., by Marshall & Fox, of Chicago. These architects, with the firms of Graham, Burnham & Co., Holabird & Roche, and Pond & Pond, are the most prominent designers of large office buildings in the Middle West. In San Francisco, the firm of Willis Polk & Co. appears as designing a large proportion of bank and office buildings, and projects of the same nature in Boston, Mass., and Baltimore, Md., are largely the work of Parker, Thomas & Rice, who have offices in both cities. This firm has completed, in the past year, an important office building for Public Service, in Baltimore. So many large office buildings are

erected yearly in New York City that many firms of architects engage a large part of their time in this kind of work. To chronicle the year's buildings, however, in the present compass, would be impossible.

Nearly all the larger merchants in New York City had rebuilt their stores in magnificent scale on Fifth Avenue prior to 1916, but each year sees the erection of a great many smaller stores and shops on Fifth Avenue, and on its immediate side streets, but here, again, a chronicle would be impossible. Suffice it to say that the New York shops are showing a high order of architectural expression in several styles, each vying with the other in conveying to the passer-by an impression of "smartness," prestige, and self-respect.

The past year in factory design has been a prolific one, and the impetus given to American industry by the European war has resulted in the erection of many new plants, as well as extensive additions to existing factories.

Among the latest of admirable designs for factories are those for several buildings for the great Sears-Roebuck Mail-Order Company. Some of these buildings are at Kansas City, Mo., others at Seattle, Wash., and all show the real architectural possibilities of the factory. George C. Nimmons, the architect of these and many other factory buildings, usually designs in a free and colloquial sort of brick-and-stone Tudor-Gothic, and often gives a fine dignity and a dominant note of *design* to his factories by insistence on a great, massive, square tower, with buttresses. The present buildings for Sears-Roebuck at Kansas City represent but one-eighth of the projected group—the whole, when completed, will offer one of the most interesting and instructive studies in the planning and designing of industrial buildings.

It is an encouraging fact that greater attention is being paid yearly to the *appearance* of the factory. Any visitor to Detroit will find much to interest him in this connection in observing the many recently completed automobile factories, and other machine plants. Although most of these great factories present exteriors almost entirely of window area, of metal sash, their mass-design has been so well considered that they have an "architectural" aspect entirely different from our earlier factories.

The Twin City Branch of the Willis-Overland Company, Mills, Rhines, Bellman & Nordhoff, architects, has the appearance of a castle, because of a well-designed tower and good general proportions, although its walls are almost entirely of glass.

Several recent factories of design well worthy of mention are those of Rogers & Co., Chicago, Ill. (Mundie & Jensen, architects); C. P. Kimball Mfg. Co., Chicago, Ill. (George C. Nimmons, architect), and the Liquid Carbonic Plant, also in Chicago (Nimmons & Fellows, architects). In the last named, a great tower is again seen to raise the entire building to the status of "architecture," and out of the status of "utilitarian building."

A Chicago (Ill.) printing plant has been imaginatively designed by Howard Shaw (a prominent local country house designer) in a distinctively mediæval vein which is unusually interesting, and seems not at all incompatible with utilitarian aims. Throughout the country an astonishing and highly gratifying improve-

ment is seen in the design of factories, warehouses, and other similar buildings.

On the Pacific Coast, the architectural firm of Willis Polk & Co. has demonstrated that power-houses, pumping-stations, gas and electric plants and the like, may also be graciously designed buildings, of Classic or Renaissance character. An awakened sense of civic beauty, and the relationship between architecture and civic values will become increasingly apparent as the years go on, and one is safe in predicting Mr. Polk's beautiful power-houses, which are now "beautiful exceptions," will become the general and usual type in many parts of the country.

**CLUBS.** Clubs and Fraternal Orders usually add a number of interesting buildings to each year's architectural output, and a few of the more noteworthy examples may be mentioned here.

Most notable, perhaps, is the new building for the Colony Club of New York on 62nd Street, east of Fifth Avenue, by Delano & Aldrich. This building takes the place of the previous home of the club (by McKim, Meade, & White) on lower Madison Avenue. The new building is of brick and Indiana limestone, and is designed in a vein combining certain Adam traits with certain others more suggestive of Georgian Colonial.

In a very different style, and for a club of very different nature, is the building on West 48th Street, by Harry Allan Jacobs, recently opened for the Friars' Club. Here the architect most appropriately based his design on a modified sort of mediæval, monastic Gothic. Grotesques are effectively used, and tall, pointed windows with leaded diamond panes contribute largely to the desired flavor of antiquity, both within and without.

Palatial clubs called "Athletic Clubs" in all the larger cities of the Middle West are now becoming an indispensable index of civic progress and enlightenment, and the past year has seen the opening of three, in addition to all those in operation prior to 1916.

The Minneapolis Athletic Club, of Minneapolis, Minn., was designed by Bertram & Chamberlain. The Missouri Athletic Club, of St. Louis, Mo., was designed by Wm. B. Ittner and G. F. A. Brueggeman, associated. The Detroit Athletic Club of Detroit, Mich., was designed by Albert Kahn and Ernest Wilby.

The most important country club opened for some time past is the South Shore Country Club, of Chicago, Ill., designed by Marshall & Fox. This is a club-house of vast extent and complex equipment, rising from the shores of Lake Michigan, twin towers and a bulk of building suggesting a large summer hotel. Luxurious and complete, it typifies the height of modern American country-club requirements.

**RAILROAD STATIONS.** The planning of modern railroad stations continues along the advanced lines of development which the last 10 years have evolved. As in school and hospital design, there are new and efficient solutions of problems involving ventilation and sanitation, as well as new forms for the superficial expression of design. It seems as though broad ramps, or slightly pitched run-ways, may eventually take the place of nearly all stairways in railroad station construction, as well as in many other types of building where large crowds of people

are in continuous motion. A ramp relieves much of the crowd-congestion resultant from stairways. Great promise of further and even more radical developments in the sane and pleasing design of all buildings intended for public use is to be read in the remarkable progress which the last three, four, or five years have witnessed.

**THEATRES, ETC.** The erection of buildings for the production of theatrical enterprises has been largely arrested by the ever-increasing popularity of the motion picture. This condition has naturally resulted in the development of "The Motion Picture Theatre," which may be a diminutive affair of less than twenty feet street frontage, or a large and elaborate theatre carried out with a great deal of "style" and considerable expenditure. A material frequently used is glazed terra cotta, plain or in polychrome matt glazes. Hundreds of motion picture theatres are now erected annually, and the observer will be able to note with gratification that many of the architectural solutions are by no means without merit.

Many inventions bearing upon problems of construction, many new manufactured building materials, and many new devices and inventions in the realm of efficient or harmonious equipment yearly make possible the performance of architectural work of constantly advancing merit, economy, and appearance. Many new needs have arisen in recent years, but all are being met or are a subject for earnest study by our indefatigable architects. Even those who, through ordinary observation, are sufficiently interested in the current architecture of their own country to look about them, should feel, at the close of each year, that there lies behind a tangible record of earnest effort and worthy achievement, and that there lies ahead unqualified promise of still better things, and of new opportunities for the ultimate expression of the best that American architecture can produce.

**ARCHITECTURE IN EUROPE.** For the most part the warring nations are at a standstill in the pursuit of their several constructive and creative arts, the present situation being but a continuation, with the additional aggravation of another year of war, of the conditions outlined in the *YEAR BOOK* for 1915.

*The Studio* (published in this country as *The International Studio*), English, continues to print its usual quota of interesting British country houses, under the heading "Recent Designs in Domestic Architecture," and unless the material is being drawn from the editorial files, it is evidence of anything but a serious suspension of architectural activity in England. As might well be supposed, the architects of England are now called upon extensively for the design of memorial monuments and tablets, which present the admirable qualities of serious dignity and sincerity which would be looked for under the circumstances.

**ARCTIC EXPLORATION.** See *POLAR RESEARCH, Arctic*.

**ARGENTINA.** A federal republic of southern South America. Argentina, or the Argentine Republic, is officially called *la República Argentina* or *la Nación Argentina*. The capital is Buenos Aires, coextensive with the Federal District.

**AREA AND POPULATION.** The republic consists of 14 provinces, 10 territories, and the

Federal district. Estimates of area differ considerably; the one which seems most acceptable is 2,987,356 square kilometers (1,153,417 square miles); a planimetric calculation made at the University of La Plata shows an area of 2,789,462 square kilometers (1,077,011 square miles). In recent years the population has rapidly increased, but greatly excessive estimates, as 9,000,000 and even 10,000,000, have appeared in print.

The census of June 1, 1914, showed a total population of 7,885,237 (about 6.84 per square mile), as compared with 3,954,911, the number returned by the census of 1895. It is estimated, however, that 30,000 Indians and 60,000 other persons were not included in the 1895 census. Of the 7,885,237 inhabitants in 1914, 5,527,285 were Argentines; this number includes children of foreign parentage born in the republic and 33,219 naturalized foreigners. Foreigners not naturalized numbered 2,357,952; of these, 777,845 were in the Federal district. Of the Argentines, males numbered 2,753,214, and females 2,774,071; foreign males numbered 1,473,809, and foreign females 884,143. The population of the States and the Federal district was 7,526,499; that of the territories, 358,738.

A 1915 estimate of the population places the total at 7,979,259, or about 6.92 per square mile. The estimate for the Federal district (that is, the city of Buenos Aires), with an area of about 72 square miles, was 1,594,170; Province of Buenos Aires, 2,155,118 (18.29 per square miles), Santa Fé, 922,406 (18.19); Córdoba, 598,545 (8.95); Entre Ríos, 423,100 (14.47); Corrientes, 365,434 (10.90); Tucumán, 348,582 (33.45); Mendoza, 296,553 (5.25); Santiago del Estero, 247,004 (4.46); Salta, 161,150 (3.34); San Juan, 130,412 (3.44); San Luis, 126,895 (4.37). The least populous divisions of the republic are the territories Tierra del Fuego (with 0.29 per square mile, as estimated in 1915), Chubut (0.27), Santa Cruz (0.08), and Los Andes (0.07).

Buenos Aires is the largest city of the Southern Hemisphere and, after Paris, the largest Latin city in the world. Its population June 1, 1914, was 1,560,163; as estimated Jan. 1, 1916, 1,598,571. The second Argentine city is Rosario, with an estimated population of 234,885 in February, 1916. The 1914 estimate for the city of Córdoba was 135,000; La Plata (1912), 106,382; Tucumán (1913), 78,695; Bahía Blanca, 75,000; Mendoza, 62,000.

The great war has sharply affected immigration and emigration. Immigrants and emigrants in 1913 were reported to number 302,047 and 156,829 respectively; in 1914, 182,659 and 221,008; the reported number of immigrants in 1915 was 86,166.

EDUCATION. Of the population over six years of age about one-half is illiterate. Primary instruction is free, secular, and nominally compulsory between the ages of six and fourteen. The population of school age in 1913 is stated at about 1,275,500, of whom about 804,000 were in school attendance. For secondary education, the Federal government maintains 30 colleges (about 8800 students); private institutions of the same grade number 38 (about 3200 students). Besides normal schools and industrial, commercial, and other special schools, there are five universities; national universities are those of Córdoba (founded 1613), Buenos Aires

(1821), and La Plata; the universities at Santa Fé and Tucumán are provincial. Of the universities, Buenos Aires has by far the largest attendance; the enrollment in its various faculties and affiliated schools was 8032 in 1914. There is no state religion, but the Roman Catholic Church receives government support. Civil marriage was established in 1884.

PRODUCTION. Agriculture and stock-raising are Argentina's principal sources of wealth. Various minerals, including petroleum, occur, but mining has not become of any great importance. The leading industrial business is meat-packing, in the River Platte region. Flour-milling shows a considerable development. Besides flour and preserved meats, the manufactures include butter, cheese, sugar, wine, quebracho extract, and textiles. It was reported in 1916 that on account of the great war manufactures, particularly textiles, were showing an especial increase.

The following table shows in hectares the reported area of the principal grain crops in the years 1914-15 and 1915-16, average for the 5-year period 1909-10 to 1913-14, and the percentage of the 1915-16 crop on the average crop for the 5-year period:

	Area in hectares			Percent- age
	1914-15	1915-16	5-year av.	
Wheat ...	6,261,000	6,645,000	6,495,744	102.3
Rye .....	92,800	85,600	84,308	249.5
Barley ...	169,850	174,500	93,035	187.6
Oats .....	1,161,000	1,038,000	969,714	107.0
Corn .....	4,203,000	4,018,850	3,524,850	114.0
Linseed ..	1,723,000	1,619,000	1,620,584	99.9

Below are shown the corresponding figures for production, in metric quintals:

	Production in metric quintals			Percent- age
	1914-15	1915-16	5-year av.	
Wheat ...	45,850,000	46,988,000	40,526,152	116.0
Rye .....	460,000	510,000	855,325	148.5
Barley ...	1,120,000	1,400,000	956,977	146.3
Oats .....	8,310,000	10,927,000	8,118,186	134.6
Corn .....	85,916,450	40,930,000	48,694,000	84.1
Linseed ..	11,255,000	9,974,000	8,018,584	124.4

Other important products are alfalfa, potatoes, sugar cane, and wine. The government is encouraging the cultivation of rice and yerba maté. Of the latter, immense quantities are imported from Paraguay and especially from Brazil. Reported wine production in 1915, 4,823,475 hectolitres; of this, 80.4 per cent was produced in the Province of Mendoza and 16.7 per cent in San Juan. In the production of linseed Argentina ranks first among the countries of the world. See COTTON.

A recent live stock estimate is as follows: horses, 9,700,000; mules, 580,000; asses, 340,000; cattle, 29,500,000; sheep, 80,000,000; goats, 4,500,000; swine, 3,050,000. Returns published in 1916 of a live stock census of Buenos Aires province showed 3,371,179 horses, 11,336,513 cattle, 18,528,641 sheep, and 1,324,408 swine; as compared with the live stock census of 1908, horses showed an increase of 851,226, cattle 985,278, swine 613,167, and sheep a decrease of 16,076,151.

COMMERCE. In 1914 and 1915 imports amounted to \$263,663,363 and \$220,085,951 respectively; exports, \$338,776,517 and \$541,532,224. In 1914 there was a very great decline in foreign trade, due both to domestic economic

conditions and to the great war. About the beginning of 1915 trade began to adjust itself to the changed conditions caused by the war; imports continued below the normal of peace times, and exports above the normal, the latter case being due in part to increase of prices. Valued in thousands of pesos gold, imports and exports have been as follows:

	1905	1910	1913	1914	1915
Imports	205,154	351,771	421,353	271,818	226,893
Exports	322,844	372,626	483,505	349,254	558,281

Principal classified imports, in thousands of pesos gold, in 1914 and 1915 respectively: textiles and manufactures thereof, 52,517 and 51,935; oils, grease, etc., 20,053 and 36,140; food products, 23,324 and 22,556; earths, stone, glass, coal, etc., 28,847 and 19,890; iron and steel and manufactures thereof, 35,158 and 18,646; building materials, 17,935 and 11,935; chemicals and pharmaceutical products, 11,110 and 10,590; railway cars, equipment, carriages, automobiles, etc., 22,959 and 6798; wines, liquors, and other beverages, 8131 and 6562; agricultural implements and machinery, 3239 and 6547; tobacco, 5908 and 6145; metals (other than iron and steel) and manufactures thereof, 7648 and 5870; paper and manufactures thereof, 7421 and 5823.

Exports as classified under six general heads are shown below, in thousands of pesos gold:

	1912	1913	1914	1915
Live animals and meat products	188,216	165,800	151,746	218,780
Agricultural products	278,187	301,267	184,367	312,884
Forest products	8,983	10,618	9,239	19,012
Mining products	285	195	84	180
Hunting and fishing	2,608	1,817	1,320	2,045
Miscellaneous	2,712	3,808	2,498	5,380
Total	480,391	483,505	349,254	558,281
Value in thousands of dollars	465,980	468,999	338,777	541,532

Imports and exports of coin and bullion (not included in the foregoing figures) were 4,200,517 and 6346 pesos respectively in 1915.

Imports by principal countries, in thousands of pesos gold:

	1912	1913	1914	1915
United Kingdom	118,669	130,887	92,475	67,782

\* The exports "for orders" are not recorded at Argentine ports as for specific countries, but are subject to cable or other orders for final destination.

The effect of the great war on shipping entered and cleared at Argentine ports is very marked. In 1913, foreign tonnage entered and cleared was 27,007,000 (metric); in 1915, 18,866,000. In 1913, nearly 92 per cent of the foreign tonnage was under the flags of the now belligerent nations; in 1915, about 70 per cent. British shipping entered and cleared in 1913 and 1915 respectively was 18,433 and 11,094 thousand tons; Dutch, 446 and 1494; Italian, 1444 and 1148; Norwegian, 498 and 1023; French, 1182 and 775; Spanish, 430 and 755; Greek, 74 and 556; American, 27 and 499; Belgian, 347 and 269; German, 2840 and 16.

COMMUNICATIONS. In length of railway, Argentina ranks first among Latin-American countries and ninth among the countries of the world. The reported length of railway in operation in 1915 was 22,688 miles, of which 4136 miles belonged to the state. The electric service on the Argentine Central Railway, between the two stations of Retiro and Tigre, was inaugurated during 1916. This line was proposed in 1910 and after the consent of the government had been obtained orders for the machinery, rolling stock, and equipment were placed in 1913. The line is about 17 miles long, and the third rail system is used. The rolling stock, only a portion of which had arrived in Argentina owing to the war, was to consist of 105 coaches—of which but 72 had been received—50 trailer coaches and 55 motor coaches.

Telegraph lines (1915), 43,153 miles (of which, national lines 23,978 miles), with 131,586 miles of wire. Radiotelegraph stations, 12. Post offices (1915), 3365.

FINANCE. The monetary unit is the peso (gold), equivalent to 5 francs, or 96.475 cents. Under the conversion law of 1899, the paper peso is current with a value of 44 per cent of the monetary unit, or 42.449 cents. For 1915 and for 1916, the budget showed estimated revenue of 393,230,564 pesos paper—322,554,626 ordinary and 70,675,938 extraordinary. The estimated expenditure according to the 1915 budget was 392,818,501 pesos paper—322,142,563 ordinary and 70,675,938 extraordinary. For 1916, the budget showed estimated expenditure of 352,930,871 pesos paper—307,142,079 ordinary and 45,788,792 extraordinary. Import duties constitute nearly one-half of the estimated ordinary revenue. Other important sources of revenue are tobacco, spirits, land tax, stamps, and port dues. In the 1916 budget, the larger estimated ordinary expenditures were: for public debt, 88,738,069 pesos paper; justice and education, 60,171,637; interior, 47,332,181; army, 26,059,327; navy, 22,121,033; treasury, 17,287,803; pensions, etc., 14,250,006;

agriculture, 11,462,008; public works, 7,350,804. The estimated extraordinary expenditure included 33,538,254 pesos paper for public works. The government's gold reserve on Sept. 1, 1916, was reported at 316,827,643 pesos; against this reserve, paper, nickel, and copper money in circulation totaled 1,013,081,058 pesos.

**ARMY.** The army of Argentina in 1916 came in for more than its usual share of interest for the reason that attention was directed to the scheme of universal service in force, as well adapted to a republic and especially to American conditions. At the same time critics in Argentina were by no means convinced that the military laws were the best possible inasmuch as features of French and German statutes or regulations had been taken that were not applicable to Argentine conditions. According to the law of September 28, 1905, as subsequently amended, personal military service in Argentina is obligatory on every citizen from 20 to 45 years of age, one year of the first period of service being spent with the colors, 10 years in the national guard, and 5 years in the territorial guard. With universal service the men of military age are trained and divided into 8 classes for the army of the line, which has an effective strength of 170,000. Of these 138,000 have received military training of from 3 months to 2 years. An effective strength of 215,000 was claimed for the national guard, of which 100,000 had received military training. It was estimated that Argentina could raise on mobilization an army of about 260,000 men of from 20 to 40 years of age. In 1916 considerable difficulty was experienced on account of the large number of illiterates, and in the *Resista Militar* for May it was stated that 5730 of 13,700 men incorporated in the last conscription were illiterate, so that there was involved the problem of adjusting the training to their various capacities. A change in the law was demanded so as to diminish the time of service for the more intelligent and increase it for the illiterate. Compulsory service in Argentina has had the effect of assimilating the foreign born, who form a large portion of the population, and the army is said to be the institution that has contributed most highly to the state. The actual organization of the army was provided by the law of 1913 and in times of peace consists of a permanent army of 6 generals of divisions, 12 generals of brigades, 70 colonels, 150 lieutenant colonels, 200 majors, 320 captains, 220 first-lieutenants, 300 lieutenants, 144 sub-lieutenants, and 20,000 men. On a peace footing there are five divisions, comprising 20 regiments of infantry, 9 regiments of cavalry, 5 regiments of field artillery, 1 regiment of field howitzers, 2 groups of mountain artillery, 1 battery of horse artillery, 1 battery of siege artillery, 1 machine gun battalion, 5 battalions of engineers, and the requisite supply, medical, and technical troops.

**NAVY.** The navy includes: 2 old coast guards (1890 and 1891), aggregating 4600 tons; 1 old coast guard (1880), 4200 tons; 4 armored cruisers, *Garibaldi* (1896), *San Martin* (1897), *Belgrano* (1898), *Pueyrredon* (1898), aggregating 27,400 tons; 3 protected cruisers (1890 to 1895), 11,620 tons; several torpedo-boat destroyers, torpedo boats, river gunboats, etc. Besides the foregoing vessels Argentina possesses two

dreadnoughts, the *Rivadavia* and the *Moreno*, both launched in 1911, the former at Quincy, Mass., and the latter at Camden, N. J.; each displaces about 28,000 tons, and has a main battery of 12 12-inch guns and a speed of 22.5 knots.

**GOVERNMENT.** The executive authority is vested in a president, who, with a vice-president, is elected for six years by indirect vote and is ineligible for the next term; he is assisted by a responsible ministry of eight members. The legislative power is exercised by a congress of two houses, the Senate and the Chamber of Deputies. Senators (30 in number, 2 from each province and from the Federal district) are elected for nine years by the provincial legislatures and, in the Federal district, by a special body of electors. Deputies (120) are elected by direct vote for four years. For the term ending Oct. 12, 1916, Roque Sáenz-Peña was elected president, in succession to Figueroa Alcorta. Sáenz-Peña died Aug. 9, 1914, and the vice-president, Victorino de la Plaza, assumed the executive office. On Oct. 12, 1916, Hipólito Irigoyen was inaugurated president, and Pelagio Luna vice-president, for the six-year term.

**HISTORY.** On July 9th President Victorino de la Plaza narrowly escaped death at the hands of an anarchist, who attempted to assassinate him while he was reviewing the troops from a government building in Buenos Aires. The nomination for president was offered to Dr. Hipólito Irigoyen on Mar. 22nd. Upon his declining it the Radical party at its national convention voted unanimously against accepting his refusal, whereupon Dr. Irigoyen consented to become a candidate. He was elected president, with Don Pelagio Luna as vice-president, by the electoral college on June 12th, receiving 152 votes out of 298 after an extremely bitter political campaign. He was the first Radical chosen to that office. During the campaign there were disturbances in the provinces, which caused the national government to intervene, and to establish military authority. Congress ratified the presidential election on July 20th. This was the first election held under the law introducing minority representation, the *scrutin de liste*, and the secret obligatory vote.

**ARIADNE AUF NAXOS.** See MUSIC, Germany.

**ARIZONA. POPULATION.** The estimated population of the State at the end of 1916 was 259,666. The population in 1910 was 204,354.

**AGRICULTURE.** The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1915-16 were as follows:

		Acreage	Prod. Bu.	Value
Corn	.....1916	22,000	770,000	\$1,078,000
	.....1915	20,000	600,000	690,000

	.....1915	147,000	a 470,000	4,512,000

a Tons.

**MINERAL PRODUCTION.** The output of gold, silver, copper, lead, and zinc in the State in

1915 was valued at \$90,600,349, an increase of nearly 40 per cent over 1914. The increases are especially noteworthy in lead and zinc, the great change in the prices of these metals making this nearly \$26,000,000 in copper, \$400,000 in lead, and over \$200,000 in zinc. The output of gold increased slightly, but the production of silver surpassed all previous records. It amounted to 5,649,020 ounces, a gain of nearly 25 per cent over 1914. Arizona is the leading copper-producing State, and had an output for 1915 of nearly 460,000,000 pounds, an increase over the previous year of nearly 57,000,000 pounds, and in value nearly \$26,000,000. The output of lead increased 22,272 pounds in 1915, or over 48 per cent. The production of zinc increased to 17,729,000 pounds, or over 21 per cent. During the year deposits of quicksilver were discovered in the Mazatzal range. The development has not progressed to a point which would indicate the practical value of these deposits.

The output of gold, silver, copper, lead, and zinc in the mines of the State in 1916 had a total value of nearly \$203,000,000, according to the estimates of the United States Geological Survey. This is the record production of the State, and may be compared with the value of \$90,600,349 in 1915. The notable output of copper and the high price of metals assisted in this increase of 123 per cent. The production of gold increased from \$4,166,025 in 1915 to approximately \$4,427,000 in 1916, an increase of over 6 per cent. The production of silver increased from 5,649,020 ounces in 1915 to a record of about 6,823,000 ounces in 1916. As the market value was much higher, the value increased from \$2,864,053 to nearly \$4,490,000, or nearly 51 per cent. The mined output of copper surpassed all records and previous estimates. It increased from 459,972,295 pounds in 1915 to approximately 693,000,000 pounds in 1916. The value of the output increased from \$90,495,252 to nearly \$190,000,000, or 135 per cent. The mined output of lead increased from 21,738,969 pounds in 1915 to a record production of over 26,000,000 pounds in 1916, and the value increased from \$1,021,732 to \$1,768,000, or 73 per cent. The production of zinc increased from 18,220,863 pounds in 1915, valued at \$2,259,387, to about 20,980,000, valued at \$2,874,260, in 1916, an increase of nearly 27 per cent in value.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in so far as the figures relating to the individual States are concerned in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments . . . . .	311	322
Average number of wage earners . . . . .	6,441	6,898
Capital invested . . . . .	\$32,873,000	\$40,300,000
Wages . . . . .	5,595,000	6,229,000
The value of materials used . . . . .	33,600,000	39,283,000
The value of products . . . . .	50,257,000	64,090,000

**TRANSPORTATION.** The railway mileage of the State on June 30, 1915, was 2989. The railways having the longest mileage are the Atchison, Topeka, and Santa Fe, 1159; Southern Pacific, 682; Arizona Eastern, 448; and the El Paso and Southwestern, 349.

**FINANCE.** The latest figures available for

the financial condition of the State are for 1914. At the beginning of that fiscal year there was in the treasury a balance of \$1,034,183. The receipts for the year amounted to \$2,770,571, and the disbursements to \$3,051,356, leaving a balance of \$703,298 at the end of the year. The bonded debt of the State amounted to \$3,500,000.

**EDUCATION.** The total school population of the State in 1916 was 57,259. There were enrolled in the public schools 47,945 pupils. The average daily attendance was 31,812, and in the high schools 2244. The male teachers numbered 202, and the females 1162. The average monthly salary of male teachers was \$114.18, and females \$87.86.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions of the State with their population in 1916 were as follows: State Hospital for the Insane, 487; Arizona State Prison, 376; Home for the Aged and Infirm Arizona Pioneers, 42; State Industrial School, 66.

The most notable feature of the administration of these institutions during the fiscal year 1916 was the effect of prohibition on the prison population. The population of the prison on June 30, 1914, at which time the sale of intoxicating liquors was legalized, was 436. For the fiscal year ending June 30, 1916, which was the first fiscal year entirely free from intoxicating liquors, the population was 329. During the fiscal year ending June 30, 1914, there were received in the State prisons from the courts 289 prisoners, while during the fiscal year ending June 30, 1916, there were received 195 prisoners. Prior to the inauguration of prohibition the prison population was increasing annually.

**POLITICS AND GOVERNMENT.** The campaign in Arizona resulted in one of the surprises which distinguished the presidential campaign of 1916. The State has been normally Democratic since its admission to the Union, and it continued its tradition in casting its vote for President Wilson by a considerable plurality, while it elected by a plurality of only 32 votes, a Republican Governor. The national campaign was not pressed with great vigor by the Democrats. W. J. Bryan made speeches, as did Senators Owen and Gore of Oklahoma. The Senators from the State also took an aggressive part in the campaign. The most distinguishing feature from the Republican side was the visit of Colonel Roosevelt in October. He made an address at Phoenix, in which he severely criticised the administration on its course in Mexico. The candidates for Governor were George W. P. Hunt, Democrat, who had been Governor of the State since its admission, and Thomas E. Campbell, Republican. The final vote was 27,978 votes for Campbell, and 27,946 for Hunt. For United States Senator Henry F. Ashurst received 29,873 and Joseph H. Kibbey 21,261. The State officers with the exception of Governor are all Democratic. The vote for President was 33,170 for Wilson, 20,524 for Hughes. A number of amendments were voted on, and the most important of them were carried. An initiative and referendum amendment was carried by a vote of 18,356, for, to 13,561, against. The amendment for prohibition was carried by a vote of 28,473, for, to 17,379, against. An amendment providing for work-

men's safety was defeated. An amendment abolishing the State Senate was also defeated. An amendment abolishing the death penalty was carried by a small majority. An amendment creating a Department of Labor was defeated, as was also the amendment creating the office of State architect. An amendment providing for absolute divorce was also defeated.

President Wilson in June signed a proclamation excluding 558,520 acres from the Dixie National Forest. Three-fourths of this area are subject to settlement under the Homestead laws from July 12th to and including August 8th, and thereafter to disposition under any public land law which applies to them. The excluded lands lay in the northwestern part of the State, and are valuable chiefly for grazing purposes.

The decision of the Superior Court of the State which held that under the Webb-Kenyon Act liquor could not be lawfully brought into the State even for personal use, was set aside in April by the Supreme Court of the State, which held that the judge of the Superior Court erred in his decision and that "it is not unlawful in Arizona to have or to personally use intoxicating liquors."

**STATE OFFICERS.** Governor, Thomas E. Campbell, Republican; Secretary of State, Sidney P. Osborn; State Auditor, Jesse L. Boyce; State Treasurer, David F. Johnson; Attorney-General, Wiley E. Jones; Superintendent of Public Instruction, C. O. Case; Corporation Commissioner, Amos A. Betts; State Mine Inspector, G. H. Bolin.

**JUDICIARY.** Supreme Court: Chief Justice, Alfred Franklin; Associate Justices, D. L. Cunningham, Henry D. Ross; Clerk, Clay F. Leonard.

**ARIZONA, UNIVERSITY OF.** A co-educational State institution at Tucson, Arizona, founded in 1885. It comprises a College of Agriculture, a College of Mines and Engineering, and a College of Letters, Arts, and Science, the total number of students in the autumn of 1916 being 492. In the faculty were 65 members. Mining interests of the State have lately given \$100,000 to be added to a \$75,000 State appropriation for the erection of a mines and engineering building. An observatory will be built and equipped through a gift of \$60,000, so far anonymous. The university receives \$90,000 annually from the Federal government and for the biennium 1915-17 was granted \$537,028 by the State. In addition, it has in productive funds \$167,223 and in income \$6688. There are 25,000 volumes in the library. President, R. B. Von Kleiss Smid.

**ARKANSAS. POPULATION.** The estimated population of the State at the end of 1916 was 1,753,033. The population in 1910 was 1,574,449.

**AGRICULTURE.** The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1915-16 were as follows:

	Acreage	Prod. Bu.	Value
Corn .....	2,550,000	45,185,000	\$44,232,000
..... 1915	2,700,000	62,100,000	89,744,000

a Tons. b Pounds. c Bales of 500 pounds gross weight.

**MINERAL PRODUCTION.** The coal production in the State in 1915 was 1,652,106 short tons, valued at \$2,950,456, compared with 1,836,540 short tons, valued at \$3,158,168, in 1914. About 70 per cent of the total of the State is produced in Sebastian County. This county, however, showed a decrease in 1915 whereas all other counties showed increases. There were 3751 men employed in and about the coal mines in 1915.

The lead and zinc mined in the State in 1915 was valued at \$801,754, compared with \$65,214 in 1914. The shipments of zinc carbonate in 1915 amounted to 7925 tons, valued at \$408,079, an increase of 700 per cent in quantity and 1500 per cent in value over 1914.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments...	2,925	2,604
Average number of wage earners .....	44,982	41,979
Capital invested .....	\$70,174,000	\$77,162,000
Wages .....	19,113,000	20,752,000
The value of materials used..	34,935,000	44,907,000
The value of products .....	74,916,000	83,940,000

**TRANSPORTATION.** The total railway mileage of the State is 5400 miles.

**FINANCE.** The report of the State treasurer for the fiscal year 1916 shows total receipts from all sources \$3,961,075, disbursements \$3,728,016, balance \$254,055. The chief sources of revenue are direct tax. The chief expenditures were for schools, Confederate pensioners, charitable institutions, and for officers' and employees' salaries. The bonded debt of the State was \$1,250,500.

**EDUCATION.** The total school population of the State in 1916 was 649,083. The total enrollment in the public schools was 437,953, and the average daily attendance was 283,566. There were 4982 male teachers, and 6080 female teachers. The average monthly salary for male teachers was \$65, and for female teachers \$50.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions of the State include the State Hospital for Nervous Diseases at Little Rock, the Deaf Mute Institute at Little Rock, School for the Blind at Little Rock, the Confederate Soldiers' Home at Sweet Home, the Arkansas State Penitentiary and State Farm,

and the Arkansas State Reform School at Little Rock.

**POLITICS AND GOVERNMENT.** There was no meeting of the Legislature in 1916, as the sessions are biennial, and the last was held in 1915. There were three candidates for the Democratic candidacy for Governor, Dr. Charles H. Brough, formerly of the Chair of Political Economy at the University of Arkansas, Earl W. Hodges, former Secretary of State, and L. C. Smith, formerly sheriff and county judge. Dr. Brough received the nomination. The Republicans nominated Wallace Townsend, lawyer, of Little Rock. In the vote for Governor, Brough received 122,041 votes, and Townsend 43,965. United States Senator James P. Clarke, who was serving his third term, died on October 1st. There was no time to hold the Democratic primaries for the election of November 7th, and the Democratic State Central Committee nominated William F. Kirby, of the Supreme Court. His opponent was H. L. Rimmel, Republican national committeeman from Arkansas. The State elections were formerly held in September, but the Legislature of 1915 passed a measure consolidating the State and national elections. Mr. Kirby was elected United States Senator, by a vote of 110,293 to 48,922 for his Republican opponent. In the voting for President, President Wilson received 112,282, Mr. Hughes, 47,135 votes. Two important proposed acts and three proposed constitutional amendments were submitted to the voters through the initiative. Act. No. 1 was a proposed new primary election law. It was adopted by a vote of 93,790 to 46,696. Act. No. 2 proposed to substitute a local option law for the State-wide prohibition measure which was passed by the Legislature of 1915. It was defeated by a vote of 109,697 to 58,064. A constitutional amendment, No. 12, proposed to give school districts the right to increase the local school tax from 7 to 13 mills. It was adopted by a vote of 108,173 to 52,175. Amendment No. 13 proposed a new referendum and initiative to take the place of the present measure. The general argument against it was that it was too radical. The measure provided among other things that no law adopted by the people could be regarded as unconstitutional, except by a unanimous vote of the supreme court. This measure was defeated by 73,782 to 69,817. Another initiative and referendum has already been drafted which is designed to remove the serious objections that were urged against the one defeated. Amendment No. 14 would have authorized counties to vote the present three-mill record tax for periods as long as 30 years instead of two years as now, so that bonds might be issued against the revenue thus provided for. The amendment received 82,703 votes to 67,656 against it, but failed adoption because it lacked about 5000 votes of the majority of all those cast in the election which the constitution requires.

**OTHER EVENTS.** On February 6th, the flood waters of the Arkansas River broke the levees, and flooded a number of towns in the southeastern part of the State. Sixteen lives were lost, several thousands of persons were made homeless, and damage was done to the extent of several hundreds of thousands of dollars. The Arkansas City water rose 15 feet above the level of the town on one side, and on the other side formed a great lake about 40 miles long and about 20 miles wide.

**STATE OFFICERS.** Governor, Charles H. Brough; Secretary of State, T. J. Terral; Treasurer, Rufus G. McDaniel; Auditor and Insurance Commissioner, Hogan Oliver; Attorney-General, J. D. Arbuckle; Superintendent of Education, J. L. Bond; Commissioner of Agriculture, J. H. Page; Commissioner of Public Lands, W. B. Owen — all Democrats.

**JUDICIARY.** Supreme Court: Chief Justice, Edgar A. McCulloch; Justices, F. G. Smith, C. D. Wood, T. Hayden Humphreys, and Jesse C. Hart; Clerk, P. D. English.

**STATE LEGISLATURE.** Almost wholly Democratic.

**ARKANSAS, UNIVERSITY OF.** A co-educational State institution founded in 1871 at Fayetteville, Arkansas. In the fall of 1916 there were 814 students and 70 instructors. The productive funds amounted to \$130,000 and the total income from all sources to about \$236,000. The library contains 25,500 volumes. President, John Clinton Futrall.

**ARNOLDSON, KLAS PONTUS.** A Swedish author and peace advocate, died in Stockholm, Feb. 20, 1916. He was born at Göteborg in 1844 and was largely self-educated. From 1871 to 1881 he was in the service of the state railways. During this time he became prominent by his writings in support of rationalistic philosophy and as a publicist. As a member of the Riksdag from 1882 to 1887, he advocated permanent neutrality for the Scandinavian countries. By founding the Swedish Society for Peace and Arbitration he made himself a leader in the world peace movement. Other public causes that gained his support were those of religious freedom, women's rights, and social betterment. In 1908 the Nobel peace prize was divided between Arnoldson and M. F. Bajer of Denmark, Arnoldson devoting his share of the money to the cause of peace. He edited several periodicals and wrote much besides, publishing as his most important work *Seklernas hopp: en bok om världsfreden* (*The Hope of the Centuries: a Book on World Peace*), which appeared in 1900 and was translated into English, French, German, and Norwegian.

**ASHLEY, CLARENCE DEGRAND.** An American legal scholar and educator, died in New York City, Jan. 26, 1916. He was born in Boston in 1851, graduated from Yale in 1873 and in law from Columbia in 1880, meanwhile having studied for two years also in Berlin. After practicing law for some years, he organized in 1891, and was a professor in, the Metropolis Law School. When, four years later, this school was merged with the New York University Law

School, Professor Ashley became professor of law in the latter, and also vice dean and then acting dean; and in 1896 he added to his duties as a teacher those of dean. In this post he remained till his death. From 1899 to 1910 he also lectured at Bryn Mawr College. Early an advocate of the teaching of law by the case system, and a promoter, through the Woman's Law Class of the New York University Law School, of legal education for women, Dean Ashley published, in the field to which he devoted most attention, *Cases on Contract* (1899, 1912), *The Law of Contracts* (1911), and articles in legal journals.

**ASHURST, HENRY FOUNTAIN.** Reflected Democratic United States Senator from Arizona, Nov. 7, 1916.

**ASIA.** See articles on the various Asiatic countries; also **EXPLORATION**.

**ASPHALT.** The natural asphalt of all kinds sold in the sources of production in the United States in 1915 aggregated 75,751 short tons, valued at \$528,490, a decrease of 4137 tons, or 5 per cent in quantity, and \$15,633, or 2 per cent in value, from the production and value of 1914. The sales of manufactured asphalt in 1915 were 604,553 short tons, valued at \$4,715,583. This was obtained from petroleum of domestic origin. An increased amount was manufactured during the year for petroleum imported from Mexico. There were in 1915 39 plants manufacturing asphalt. The States producing natural asphalt were California, Kentucky, Oklahoma, Texas, and Utah. Utah in 1915 was the largest producer, and was followed by Kentucky. The asphalt imported in the United States in 1915 was 138,252 short tons valued at \$680,357. The principal use of asphaltic metal in the United States is for highway and pavement construction and maintenance. The asphalt industry in other countries was seriously affected in 1915 by the war in Europe. The amount exported to Europe from Trinidad in 1915 was 18,025 tons, compared with 75,297 tons in 1914. The exports to the United States, however, increased greatly. Trinidad is the largest producer of asphalt. Other countries producing large quantities are Venezuela, Cuba, and Canada.

**ASTOR, WILLIAM WALDORF.** A British capitalist, formerly an American citizen. He was created Baron Astor of Hever Castle by King George V Jan. 1, 1916.

**ASTRONOMY.** During 1916 the European observatories reported a continued diminution of activity, owing in many cases to the withdrawal of members of their staffs for war service. The American observatories, on the other hand, maintained their high level of productive research, the Mount Wilson Solar Observatory leading in the variety and importance of its contributions to astronomical science. The total solar eclipse of February 3rd passed almost unobserved. A new "runaway" star having a greater proper motion than any previously known was discovered by Professor Barnard. Encke's Comet was again observed at Heidelberg in September

when barely a month had elapsed from the time of its passage through aphelion, and three new comets were detected; none of the periodic comets due to return during the year was observed. An important event of the year was the dedication of the new Van Vleck Observatory of Wesleyan University, Middletown, Conn. The death roll of the year included the names of Oskar Backlund, director of the Imperial Russian Observatory at Pulkova, distinguished for his researches on the period of Encke's Comet; William Frederick King, chief astronomer of the Canadian government, and superintendent of the Geodetic Survey of Canada; Friedrich J. C. Krüger, director of the Aarhus (Denmark) Observatory, well known for his work on colored stars; Percival Lowell, founder and director of the Lowell Observatory at Flagstaff, Arizona, famous for his observations of the planet Mars; Mauryc Rudzki, director of the observatory at Cracow, and the author of numerous contributions to geophysics and seismology; and Karl Schwarzschild, director of the Potsdam Astrophysical Observatory, distinguished for his theory of radiative equilibrium of the sun, and his ellipsoidal hypothesis of stellar motions, and for other important contributions to astronomy and physics.

**MOUNT WILSON SOLAR OBSERVATORY.** The results obtained at this observatory during 1915 were briefly summarized under 78 heads by Prof. George E. Hale, the director of the observatory, in his annual report. Among the most important may be mentioned the following: The testing, both by solar observations and by laboratory experiments, of the tentative working hypothesis of sunspots, first proposed in 1912. A series of photographs was obtained showing the various phenomena of the Zeeman effect more perfectly than ever before. The continuation of the observations on the Stark effect gave positive results, but the indications are that the sun's general electric field is not more than 200 volts per centimeter at the hydrogen level. The conclusion was reached that, if anomalous refraction has any influence on the positions of the Fraunhofer lines, it must be of the second order, no correspondence being found between the solar phenomena and the degree of anomalous dispersion observed in the laboratory. The equatorial value of the sun's rotation was found to have undergone a progressive diminution when compared with the results obtained in former years. Much work on nebulae and star clusters was accomplished, 23 new variables being discovered in the globular cluster Messier 3, thus bringing the total number in that cluster to 155; and 5 new variables were found in the cluster Messier 13. The magnitudes and colors of more than 1000 stars in the latter cluster were catalogued, and a similar catalogue was made for 300 stars in the open cluster Messier 37. In the case of M13, 70 per cent of the 400 brightest stars were found to be redder than the normal solar star, while 85 per cent of the 400 faintest stars were found to be bluer. The radial velocities of 500 stars were published during the year; for four of these, the surprisingly large values of 114, -290, -148, and -179 kilometers per second were obtained; and generally stars of very low absolute luminosity, and probably of small mass, were found to have exceptionally high radial velocities. The radial velocity of approach of the Andromeda nebula was calculated to be equal to 329 kilometers per

second, while the bright-line nebula N. G. C. 1068 was determined to be retreating in the line of sight with the great velocity of 765 kilometers per second. The spectrum of Nova Geminorum No. 2, discovered by Enebo in 1912, was under observation, and changed during the year from the type characteristic of a planetary nebula to that of a Wolf-Rayet star. Success attended the work of determining the absolute magnitudes of stars, and hence their individual parallaxes, from the relative intensities of certain lines in their spectra. Considerable progress on the 100-inch telescope was reported. The dome was finished and more than 85 per cent of the work of parabolizing the great mirror was done, so that there is every probability that the instrument will be ready for use during the summer of 1917.

**THE SUN.** In 1912 Professor Hale put forward a tentative working hypothesis to account for the phenomena observed in connection with the hydrogen flocculi associated with sunspots. According to Professor Hale, the flocculi may be classified in three classes: unipolar flocculi, consisting of curved or radial lines surrounding single spots; bipolar flocculi, surrounding a bipolar spot group and bearing a more or less close resemblance to the lines of force about a bar magnet; and multipolar flocculi, which resemble somewhat the bipolar flocculi, but have a less symmetrical configuration owing to the influence of the numerous spots in a complex group. The second class affords the most numerous examples. Various explanations of these phenomena have been offered, some investigators regarding them as entirely hydrodynamical in nature, while others, including Professor Hale himself, have attributed them mainly to the magnetic fields existent in sunspots. An initial vortex is supposed to be started by an internal eruption or some other cause which forces a column of gas upward from within the sun toward the surface of the photosphere, the vortical motion being due to differences in the velocities of adjacent surfaces as the column rises. Owing to expansion cooling takes place at the centre of the vortex and gives rise to the central dark cloud or umbra. Negative ions then flow rapidly in from the hot gases outside to the cooler gases in the centre, and, partaking of the vortical motion, set up a magnetic field, along the lines of force of which the hydrogen gases in the higher atmosphere are drawn. If the spot is bipolar, its polarities are opposite, and the hydrogen flocculi arrange themselves in lines like those due to a bar magnet. In order to test which of the two sets of forces—hydrodynamical, and magnetic—are the dominant factor in producing the configurations observed, Professor Hale and Mr. Luckey made an extensive series of laboratory experiments in vortical motion. Starting with the assumption that a single spot is represented by a columnar vortex, vortices of this type were formed by spinning a vertical wire helix in a tank of water, and it was found that eventually the lower extremity of such a vortex turned up until it met the surface of the water, and the two ends in the surface afforded an excellent representation of the two spots of a bipolar group. It was also found that horizontal columnar vortices produced at some distance below the surface of the water behaved in similar fashion when the velocity of spin became sufficiently great. By filling the space above the water with smoke

it became possible to study the secondary vortices which are set up in the air by semicircular vortices below the surface of the water, and characteristic configurations were obtained which seem to be duplicated in the sunspots, as shown in a series of spot photographs recently secured at Mount Wilson by Mr. Ellerman. Further experiments conforming more nearly to solar conditions are planned, and it is expected that these will clear up certain points which are at present obscure.

**Solar Activity.** The period of maximum solar activity is again approaching, and during the year a number of large spots made their appearance on the sun's disc from time to time, several persisting through more than one rotation period. One fine large group, which crossed the central meridian on May 25th, was nearly 100,000 miles long and contained several distinct umbra. Probably associated with this spot in some way was an eruptive prominence of exceptional altitude which was observed on May 26th by Mr. Evershed at his station in Kashmir. He was able to secure a complete series of photographs from almost the beginning of the eruption. The final altitude reached by the flying fragments was a little over a semidiameter of the sun, so that the height of the prominence must have been almost 500,000 miles, which is probably a record.

**Solar Eclipse.** A total eclipse of the sun took place on February 3rd. The path of totality, which was about 9000 miles long and from 50 to 100 miles wide, started in the Pacific Ocean, crossed Colombia, Venezuela, and the Island of Guadeloupe, and, passing a few miles to the west of the Azores, ended in the Atlantic Ocean about 200 miles south of the Irish coast. Owing to the preoccupations of the European observatories, none of them fitted out expeditions, and, of the American observatories, only the Argentine National Observatory at Córdoba seems to have dispatched a party to observe the eclipse. The expedition had its headquarters at Tucacas, Venezuela, but no details of its observations have yet been received. The eclipse appears to have been observed also by a party of ten unofficial observers at Barquisimeto, Venezuela, who made a number of interesting observations with very meagre equipment. They reported that a coronal ray, three solar diameters in length, was seen on the east side of the sun's disc, and that there was a large prominence, about 125,000 miles high, to the northwest of the disc. The corona was of intermediate type, showing less flattening at the poles than at a time of minimum solar activity.

**MARS.** Prof. W. H. Pickering continued his series of monthly reports on the appearance of Mars from his station at Mandeville, Jamaica. For convenience of reference, he divides the Martian year of 688.6 (taken as 689) Martian solar days into 12 months, to which he gives terrestrial names. The first nine months have 56 days each, and the remaining three 55 days. March is the first month of the Martian year, and the vernal equinox in the northern hemisphere of the planet falls on March 1st. The autumnal equinox falls on September 36th, and the summer and winter solstices on June 27th and December 12th, respectively. Among the interesting features noticed by Professor Pickering is the shifting of some of the markings on the surface of the planet, in some cases to the extent

of 200 miles, and it is suggested that they are swamps surrounded by low ground, which is liable to extensive inundation whenever the water-level rises slightly. Certain prominent markings which appeared in drawings made by Lockyer and other observers over 40 years ago were recorded as having disappeared completely.

Professor Lowell called attention to the fact that, contrary to the general belief, the "unfavorable" oppositions of Mars are really better suited than the "favorable" oppositions for viewing the canals, for it is then that the Martian season falls during which the canals are most visible, and, moreover, the planet at the same time turns toward the earth the hemisphere on which the canals are most noticeable.

From an examination of the records of the melting of the polar caps of Mars from 1862 to 1914, M. Antoniadi found that the rate of melting can be correlated with the solar activity. The melting was found to proceed most rapidly at the maxima of the sunspot cycles, and most slowly at the minima. Only four series of observations out of 21 failed to support his conclusions which are in general agreement with the commonly accepted view, derived from direct experiment, viz., that an increase in the solar activity is accompanied by an increase in the solar radiation. The exceptions were the oppositions of 1862, 1873, 1877, and 1886. During the first two oppositions which occurred during maximum sunspot periods, the rate of melting of the caps was found to be normal, while during the last two rapid melting took place at times when the solar activity was only slight, or at least subnormal.

**SATURN.** Professor Lowell made a new series of measurements of the rings of Saturn, and detected a number of new subdivisions in ring B. He claimed that these were due to the perturbative action of Mimas, Saturn's nearest satellite, since they occur where a particle belonging to the ring would revolve about the primary in a period having some simple ratio to the period of revolution of the satellite.

**MONOCHROMATIC PHOTOGRAPHY OF SATURN AND JUPITER.** In 1912, Prof. R. W. Wood, of Johns Hopkins University, showed how by combining photographs of the moon taken by light from three or more regions of the spectrum, it was possible to gain some idea of the nature of the rocks composing the lunar surface. The most conspicuous dealt with in his experiments was an area in the vicinity of the lunar crater Aristarchus which showed as a dark patch when photographed by ultra-violet light but was invisible in an ordinary photograph or one taken by the yellow rays. Laboratory experiments on various rocks and minerals led him to conclude that the patch is probably matter ejected at some time from the crater, and consists of sulphur or perhaps ash containing sulphur. He recently extended his researches to Jupiter and Saturn, and by means of suitable screens was able to secure photographs of both planets by infra-red, yellow, violet, and ultra-violet light. The most interesting results were obtained in the case of Saturn. The infra-red picture showed the planet practically free from surface markings. Through the yellow screen, the ordinary visual appearance of the planet showing the narrow belts very distinctly was seen. The photographs by violet and ultra-violet light resembled each other, a very broad, dark equatorial belt and a

dark polar cap being shown in both; the only difference was that the broad belt between the polar cap and the equatorial belt was decidedly broader in the ultra-violet photograph. Two possible explanations were suggested. According to one hypothesis, the crape ring extends inward to the surface of the planet and consists of material which reflects the short wave lengths to a slight degree. According to the second hypothesis, the planet's atmosphere contains some substance, a fine dust or perhaps a gas, which is capable of absorbing the violet and ultra-violet rays. Such a gas would be of a pale yellow color. Chlorine and sulphur vapor naturally suggest themselves, but laboratory experiments on these gases seem to negative the supposition that it is either of them. The photographs of Jupiter showed differences almost as marked as those of Saturn. In this case, however, it was found necessary, on account of the rapid motion of the planet, to make the pictures as quickly as possible in order to obtain comparable results.

**TRANSNEPTUNIAN PLANET.** The discovery of the planet Neptune forms one of the most interesting chapters in the history of astronomy. Adams and Le Verrier were prompted to take up the question of the existence of a trans-Uranian planet by the necessity of accounting for the constantly increasing deviations from the positions demanded by theory which Uranus exhibited. In like manner, the failure of both Uranus and Neptune to conform exactly to their ephemerides, has led recent astronomers to enquire whether the differences which still exist between the theoretical positions of those planets and their observed positions are not due to a still more remote member of the solar system than Neptune. In 1908 Prof. W. H. Pickering announced that he had obtained evidence of the existence of such a planet, and later Gaillot attempted to reconcile theory and observation by postulating the existence of two new planets lying beyond the orbit of Neptune. Neptune has been known far too short a time as yet for much reliance to be placed upon its deviations from its theoretical positions in a search for a more distant planet. The case is otherwise with Uranus, the earliest observation of which was made by Flamsteed in 1690, and for which there are a number of other observations prior to its recognition as a planet by Sir William Herschel in 1781. Prof. Percival Lowell examined the whole series of observations from 1690 to the present time, and announced that the residuals could be reduced by 71 per cent, or, including errors of observation, by from 90 to 100 per cent, by the hypothesis of a single unknown planet, for which two possible positions, differing by 180° in longitude, were indicated. The distances, periods, masses, and orbital eccentricities of the two bodies are practically identical, the distance being about 44 times the distance of the earth from the sun, the period of revolution 290 years, the mass one-fifty thousandth of the sun's mass, and the eccentricity of the orbit .2. The planet will probably have a magnitude of 12 or 13, with a disc about a second in diameter. As it will change its position in the heavens very slowly, it is hardly likely that it will leave a trail on a photographic plate of sufficient length to ensure its identification, but M. Borrelly considers that the photographic chart of the heavens on which are recorded stars as faint as the 14th magnitude will prove of use in its ultimate detection.

**STARS WITH LARGE PROPER MOTION.** Professor Barnard, at the Yerkes Observatory, made the photographic discovery of a faint star of the 11th magnitude in Ophiuchus which proved to possess the largest proper motion known, viz., 10 seconds per annum. Two other faint stars with large proper motions were also reported. One of these, a small red star near  $\alpha$  Centauri was discovered by Mr. Innes at the Cape of Good Hope Observatory, using the blink microscope method; its proper motion amounted to about five seconds per annum. The other was observed photographically by Prof. Max Wolf at Heidelberg. It is situated in the constellation Pisces, and has an annual proper motion of 2.6 seconds.

**STELLAR PARALLAXES BY SPECTROSCOPY.** In a series of papers published in the *Proceedings of the National Academy of Sciences*, Washington, Prof. W. S. Adams described a new method of determining parallaxes spectroscopically, which will undoubtedly lead to important results. He has found that the relative intensities of certain lines in the spectrum of a star are closely related to its absolute luminosity, and by measurements on stars of known luminosity he has been able to obtain curves which give the absolute luminosity when the relative intensity of the lines has been determined. A knowledge of the apparent luminosity then gives the distance of the star at once. The method was applied to 66 stars of known parallax, the agreement between the values of the parallaxes derived in this way and those obtained by direct measurement being very striking.

**PLANETARY ALBEDOES.** Prof. H. N. Russell, of Princeton University, re-determined the albedoes of the planets from the most reliable data. His results are given in the table below:

Object	Magnitude	Visual Albedo	Photographic Albedo
Moon	..... - 12.55	0.07	0.05
Mercury	..... - 2.50	0.06	...
Venus	..... - 4.77	0.59	0.60
Mars	..... - 1.85	0.15	0.09
Jupiter	..... - 2.29	0.56	0.73
Saturn	..... + 0.89	0.63	0.47
Uranus	..... + 5.74	0.63	...
Neptune	..... + 7.65	0.73	...

The high value, 0.89, of the earth's albedo, obtained in 1913 by Professor Very from the brightness of earthshine on the moon was revised, and the value 0.49 was obtained.

**COMETS.** Only one comet of short period—Perrine's (1896 VII)—was due to return to perihelion in 1916. Its period is 6.454 years. (Owing to its unfavorable position at its first return in 1903, it was not found at that time, but it was observed on the occasion of its next return in 1909. It was due to pass through perihelion about the middle of April, 1916, but being again unfavorably placed it was not seen. There was also a possibility of the return of D'Arrest's Comet, which has been observed six times—in 1857, 1870, 1877, 1890, 1897, and 1910—since its discovery in 1851. It is, however, not expected to pass through perihelion until April, 1917, and the year passed without its detection.

Three new comets were discovered in 1916. These were: 1916 a; discovered by Neujmin at Simeis, Russia, on February 24th. It was a faint object of about the 10th magnitude. Its perihelion passage took place on March 11th.

1916 b; discovered by Wolf at Heidelberg on

April 27th. It was at first reported as minor planet ZK, but its cometary nature soon became evident. It possessed a stellar nucleus and a nebulous envelope, and was of the 13th magnitude. It will not pass through perihelion until June 16, 1917.

1916 c; discovered by Metcalf at Winchester, Mass., on November 17th, but no information regarding its magnitude, etc., was forthcoming at the end of the year.

Taylor's Comet, 1915 e, the discovery of which at the Cape of Good Hope on Dec. 2, 1915, was noted in the YEAR BOOK for that year, was under observation during the early part of the year. It proved to be a comet of short period, the period being 6.37 years. At the beginning of January it was of the 8th magnitude, and possessed a short tail. Early in February, it showed two distinct nuclei, and shortly afterward became too faint for observation. It passed through perihelion on Jan. 30, 1916.

An attempt to photograph Encke's Comet at the Yerkes Observatory when in aphelion was unsuccessful, but Prof. Max Wolf secured a photograph of it at Heidelberg a month later. It had the appearance of a small nebula of the 16th magnitude and showed a slight central condensation.

**MINOR PLANETS.** The report on the minor planets discovered in 1916 is necessarily incomplete owing to the difficulty of obtaining the foreign astronomical periodicals and the uncertainty of their arrival in this country. Up to April 30th, the discovery of 32 new minor planets was reported. They were provisionally designated by the letters YJ to ZQ. Ten of them (YK to YS) belong properly to 1915, bringing the total of new planets found during that year up to 35. In addition a new minor planet, designated 1914 d, was discovered upon reexamination of a plate taken at Heidelberg in 1914. Five of the new planets were discovered by Thiele (Bergedorf), and one each at the U. S. Naval Observatory (Washington), Barcelona, and Simeis; the remaining 24 were found at Heidelberg by Prof. Max Wolf, who reported that the work of the observatory had been seriously disorganized by the war. ZK proved to be a new comet, the second of the year, and ZN was identified with 271 Pentesilea.

**NEW OBSERVATIONS.** The Van Vleck Observatory of Wesleyan University, Middletown, Conn., was dedicated on June 16th. The observatory is the gift of the late Joseph Van Vleck in memory of his brother, the late John Monroe Van Vleck, for many years professor of mathematics and astronomy in the university. The principal instrument is an equatorial refractor of 18½ inch aperture and 26 feet focal length, which is to be used principally for the photographic determination of stellar parallaxes. Prof. Frederick Slocum, of the Yerkes Observatory, was appointed the first director of the observatory.

The mounting of the 72-inch reflector for the Dominion Observatory at Vancouver, B. C., was completed, and the building and dome are almost finished, so that it will probably be possible to begin observational work during 1917.

**OTHER EVENTS.** The Bruce gold medal of the Astronomical Society of the Pacific was awarded to Prof. George Ellery Hale, director of the Mount Wilson Solar Observatory, for his distinguished services to astronomy. The gold

medal of the Royal Astronomical Society was awarded to Dr. J. L. E. Dreyer for his contributions to the history of astronomy and his catalogues of nebulae.

**BOOKS.** Among the books on astronomy published during 1916 were: J. Nasmyth and J. Carpenter, *The Moon, Considered as a Planet, a World, and a Satellite*, new edition; C. H. F. Peters and E. B. Knobel, *Ptolemy's Catalogue of Stars: A Revision of the Almagest*; T. C. Chamberlin, *The Origin of the Earth*; and Sir David Gill, *Man and Astronomer*, edited by George Forbes.

**ATHLETICS.** See under the various sports, as BASEBALL, BASKETBALL, BILLIARDS AND POOL, BOWLING, BOXING, CYCLING, etc.

**ATHLETICS, TRACK AND FIELD.** Three names stand out in the performances on track and field during the year 1916. They are James E. (Ted) Meredith, who set a new world's record for the half mile of 1 minute 52 $\frac{1}{2}$  seconds and for the quarter mile of 47 $\frac{3}{4}$  seconds; Robert Simpson, who established a new world's mark for the 120-yard high hurdles of 14 $\frac{3}{4}$  seconds, and Villar Kyronen, who won the senior national cross country (q.v.) championship.

Meredith created the new half-mile record in a dual track and field meet with Cornell at Franklin Field, Philadelphia, on May 13th. Less than a month later in the intercollegiate games at the Harvard Stadium, Cambridge, Mass., he shattered all existing records for the quarter mile. Simpson, a student at the University of Missouri, twice flashed over the high hurdles in record-breaking time, first at the Missouri Valley Conference meet and then at the Intercollegiate Conference meet.

The two-mile world's record in relay racing was equaled by the Yale University team, comprising H. Rolfe, A. Barker, H. Cooper, and John W. Overton, at the relay carnival conducted by the University of Pennsylvania. The time was 7 minutes and 53 seconds. Cornell at these same contests equaled the world's record for the four-mile relay, 17 minutes and 51 $\frac{3}{4}$  seconds, the team being G. Taylor, J. Hoffmire, L. Windnagle, and D. Potter.

John W. Overton of Yale University established a new indoor A. A. U. record of 2 minutes 15 $\frac{3}{4}$  seconds for the 1000-yard run at the indoor national championships. On the same occasion J. Loomis of the Chicago A. A. ran 60 yards in 6 $\frac{3}{4}$  seconds and George H. Goulding of the Toronto (Can.) Central Walking Club walked two miles in 13 minutes 7 seconds, both performances eclipsing all former records.

One international competition took place during 1916, a team comprising five athletes from the United States making the trip to Norway and Sweden. A series of dual meets was held in which the visiting athletes were invariably victorious. The American aggregation consisted of James E. Meredith of the University of Pennsylvania, Jo G. Loomis and Andy Ward of the Chicago A. A., Robert Simpson of the University of Missouri, and Fred S. Murray of Leland Stanford University.

Loomis with 13 firsts, 2 seconds, and 2 thirds scored the largest number of points, 85 $\frac{1}{4}$ . Murray finished first 6 times, second 10 times, third 7 times, and fourth twice for a total of 80 $\frac{1}{4}$  points.

The points gathered by the other United States athletes were: Simpson, 58 $\frac{3}{4}$ ; Meredith, 44 $\frac{1}{2}$ ; Ward, 36 $\frac{1}{4}$ . One of the surprises was the defeat

of Meredith by Jean Bolin, the Swedish star, in the 800-meter races. In the shorter distances, however, Meredith scored easy victories over his rival.

The National A. A. U. senior outdoor championships were held at Weequahic Park, Newark, N. J., on September 9th. The Irish-American A. C. won the team honors with a score of 35. The New York A. C. was second with 30, while unattached athletes gathered a total of 27 points.

Other clubs to score points were: Chicago A. A., 25; Boston A. A., 17; Illinois A. C., 13; University of Wisconsin, 10; Los Angeles A. C., 9; Irish-American A. A., Boston, 5; Toronto Walkers' Club, 5; Multnomah A. C., 5; Mississippi Agricultural College, 5; Millrose A. A., 4; Salem-Crescent A. C., 3; Meadowbrook Club, 3; Missouri A. C., 2; Seattle A. C., 2; Long Island A. C., 2; Germantown B. C., 1; Kaleva A. C., 1.

In the junior outdoor championships which were also held at Newark the New York A. C. won the team title with 52 points. The Chicago A. A. was second with 20, and the Irish-American A. C. third with 16. Other scores were: Irish-American A. A., Boston, 13; Boston A. A., 13; unattached, 13; Los Angeles A. C., 10; Tioga A. A., Pittsburgh, 8; Pittsburgh A. A., 6; Knights of St. Anthony, 6; Multnomah A. C., 5; Shanahan C. C., Philadelphia, 5; Salem-Crescent A. C., 5; Swedish-American A. C., 5; Mohawk A. C., 3; University of Illinois, 3; Bronx Church House, 3; Alpha P. C. C., 3; Meadowbrook Club, 3; Kaleva A. C., 3; Long Island A. C., 3; Gladiator A. C., 3; Pastime A. C., 3; Spokane A. C., 2; Newark A. C., 2; St. Christopher Club, 1.

The senior indoor championships held at the Twenty-second Regiment Armory, New York, were won by the New York A. C. with 23 $\frac{1}{4}$  points. The Irish-American A. C. was second with 22, and the Boston A. A. third with 16. The New York A. C. also captured the junior indoor laurels with a score of 40. The Irish-American A. C. was second with 27, and the Knights of St. Anthony third with 16.

The 41st annual track and field meet of the Intercollegiate Association of Amateur Athletes of America was held at the Harvard Stadium, Boston, Mass., on May 26th and 27th. Cornell won the championship with a total point score of 45. Yale finished second with 29, and the University of California and Leland Stanford tied for third with 22. The standing of the other colleges was: Pennsylvania, 18; Dartmouth, 14; Michigan, 13; Harvard, 11; Princeton, 10; Bowdoin, 5; Syracuse, 3; Penn State, 2; Massachusetts Institute of Technology, 1.

The University of Wisconsin was victorious in the 16th annual games of the Conference Colleges of the Middle West, with a total of 49 points. Illinois was second with 35 $\frac{3}{4}$ , and Chicago third with 20 $\frac{3}{4}$ . Other scores were: Missouri, 20 $\frac{1}{4}$ ; California, 13; Purdue, 11; Mississippi Agricultural, 5; Kansas University, 4 $\frac{1}{2}$ ; Notre Dame, 4; Minnesota, 3 $\frac{3}{4}$ ; Oberlin, 3; Indiana, 2; Northwestern, 2; Ohio State, 1; Ames, 1.

The New England intercollegiate championships were won by Dartmouth with 50 $\frac{1}{2}$  points. Maine was second with 32 $\frac{1}{2}$  and Holy Cross third with 18. New York University captured the Middle States Conference title by scoring 25 points. Lafayette was second with 24 and Rutgers third with 19.

Frederick W. Rubien, secretary-treasurer of the Amateur Athletic Union, made the following selections for All-America athletic teams:

All-America Athletic Team—100-yard dash, Jo G. Loomis, Chicago A. A.; 220-yard dash, Andy E. Ward, Chicago A. A.; 440-yard run, James E. Meredith, Meadowbrook Club, Philadelphia; 880-yard run, Don M. Scott, Mississippi Agricultural College; 1-mile run, L. V. Windnagle, Cornell University; 2-mile run, D. F. Potter, Cornell University; 5-mile run, Joie Ray, Illinois A. C.; 10-mile run, Hannes Kolehmainen; cross country running, Villar Kyronen, Millrose A. A., New York; 120-yard high hurdles, Robert Simpson, University of Missouri; 220-yard low hurdles, Fred S. Murray, Leland Stanford University; marathon running, A. V. Roth, Dorchester Club, Boston; walking, R. Remer, New York A. C.; standing broad jump, Platt Adams, New York A. C.; running broad jump, H. T. Worthington, Boston A. A.; standing high jump, W. H. Taylor, Irish-American A. C.; running high jump, W. M. Oler, Jr., New York A. C.; running hop, step, and jump, D. F. Ahearn, Illinois A. C.; pole vault, Sherman Landers, Chicago A. A.; putting 16-pound shot, Patrick J. McDonald, Irish-American A. C.; throwing 56-pound weight, Michael J. McGrath, Irish-American A. C.; throwing the discus, A. W. Mucks, University of Wisconsin; throwing 16-pound hammer, Patrick Ryan, Irish-American A. C.; throwing javelin, G. A. Bronder, Irish-American A. C.; pentathlon, Fred W. Kelly, Los Angeles A. C.; all-around, Avery Brundage, Chicago, A. A.

All-America College Team—100-yard dash, H. L. Smith, University of Michigan; 220-yard dash, W. B. Moore, Princeton University; 440-yard run, James E. Meredith, University of Pennsylvania; 880-yard run, Don M. Scott, Mississippi Agricultural College; 1-mile run, L. V. Windnagle, Cornell University; 2-mile run, D. F. Potter, Cornell University; cross country running, John W. Overton, Yale University; 120-yard high hurdles, Robert Simpson, University of Missouri; 220-yard low hurdles, Fred S. Murray, Leland Stanford University; running high jump, W. M. Oler, Jr., Yale University; running broad jump, H. T. Worthington, Dartmouth College; pole vault, F. K. Foss, Cornell University; putting 16-pound shot, H. B. Liverledge, University of California; throwing 16-pound hammer, C. C. Gildersleeve, University of California; throwing discus, A. W. Mucks, University of Wisconsin; throwing javelin, R. L. Nourse, Jr., Princeton University, pentathlon, Howard Berry, University of Pennsylvania.

All-America Interscholastic Team—100-yard dash, F. Motley, Jr., Atlantic City H. S., N. J.; 220-yard dash, Evan Pearson, North Central H. S., Spokane, Wash.; 440-yard run, J. Rogers, Northeast H. S., Philadelphia, Pa.; 880-yard run, A. W. Gorton, Moses Brown School, Providence, R. I.; 1-mile run, E. W. Shields, Mercersburg Academy, Pa.; 2-mile run, George R. Goodwin, Wakefield H. S., Mass.; cross country, Robert Crawford, Flushing H. S., N. Y.; 120-yard hurdles, Walker Smith, Phillips Exeter Academy, N. H.; 220-yard hurdles, Frank Loomis, Oregon H. S., Ill.; running high jump, W. H. Whalen, Phillips Exeter Academy, N. H.; running broad jump, E. Smalley, Central H. S., Philadelphia, Pa.; pole vault, Sherman Landers, Oregon H. S., Ill.; putting 12-pound shot, James

Sinclair, Stuyvesant H. S., N. Y.; throwing 12-pound hammer, J. T. Murphy, Hebron Academy, Me.; throwing discus, Gordon Brown, Montclair H. S., N. J.; throwing javelin, Van Cortlandt Eliot, Hamilton Institute, N. Y.

See CROSS COUNTRY RUNNING AND MARATHONS.

**ATOMIC WEIGHTS.** See CHEMISTRY, GENERAL.

**AUSTRALIA, COMMONWEALTH OF.** A self-governing dominion of the United Kingdom, consisting of six original States and two territories. The temporary seat of the Federal government is Melbourne, in the State of Victoria. The permanent capital will be Canberra, founded 1913, in the Federal Capital Territory. Canberra is 204 miles southwest of Sydney, 429 miles northeast of Melbourne, and about 123 miles from Jervis Bay. The Federal Capital Territory is within the State of New South Wales.

**AREA AND POPULATION.** Australia is a vast region, much of which is uninhabited. A large part of the interior, especially in the west, is sandy and stony desert. In the table below are shown by States and territories the estimated area and the population according to the census of April 3, 1911, compared with the population as estimated at the end of 1915:

	Square miles	Population	
		1911	1915
New South Wales....	309,460	1,646,784	1,868,648
Victoria .....	87,884	1,815,551	1,417,801
Queensland .....	670,500	405,813	680,446
South Australia .....	380,070	408,558	489,860
Western Australia .....	975,920	282,114	318,016
Tasmania .....	26,215	191,211	201,025
Northern Territory....	528,620	3,810	4,568
Federal Capital Ter... ..	912	1,714	1,829
Commonwealth ..	2,974,581	4,455,005	4,981,988

The Australian States, excepting Tasmania, are notable in respect of their large areas, and Tasmania is slightly larger than Vermont, New Hampshire, and Massachusetts combined. Thus, Victoria, which is next to the smallest State, is more than half as large as Sweden, while the largest State, Western Australia, is more than twenty times as large as the State of Louisiana. New South Wales covers about 10.4 per cent of the area of the Commonwealth; Victoria, 3.0; Queensland, 22.5; South Australia, 12.8; Western Australia, 32.8; Tasmania, 0.9; Northern Territory, 17.6.

In the table above, the population figures are exclusive of full-blooded aboriginals. Such persons more or less civilized and in the employ or within the settlements of whites numbered 19,939. The total number of full-blooded aboriginals is not known; authorities believe that it was never large and that at present it does not exceed 100,000. In his report of May 31, 1913, the Queensland chief protector of aborigines estimates the total at 80,866, distributed as follows: New South Wales, 4761; Victoria, 269; Queensland, 20,000; South Australia and the Northern Territory, 29,836; Western Australia, 26,000. The last Tasmanian aboriginal died in 1876.

Persons of non-European race were returned at the 1911 census to the number of 52,343. Half-caste aboriginals numbered 10,113; full-blood and half-caste Asiatics, 34,838 and 3852 respectively; Africans, 357 and 336; Americans, 65 and 24; Polynesians, 2524 and 227; indefinite, 5 and 2.

Of the population in 1911 3,667,670 were born in Australia, 590,722 in the United Kingdom, 73,949 in other European countries, 31,868 in New Zealand, 36,442 in Asia, 4958 in Africa, 11,278 in America, 3410 in Polynesia, 4238 at sea, and 30,470 unspecified. The total number of males was 2,213,035, and of females 2,141,970.

The Australian population exhibits an excessive tendency to accumulate in towns, especially in the capital cities and their suburbs. In 1911, the aggregate metropolitan population (that is, the population of the State capitals with suburbs) was 1,694,329, or 38.05 per cent of the total population of the Commonwealth; as estimated for Dec. 31, 1913, 1,890,400, or 38.80 per cent. The capital of New South Wales is Sydney, which with suburbs had in 1911 629,503 inhabitants, while the estimated population at the end of 1913 was 725,400, or 39.60 per cent of the population of the State; capital of Victoria, Melbourne, with suburbs 588,971 in 1911, 651,000 in 1913, 46.10 per cent; of Queensland, Brisbane, 139,480 in 1911, 151,300 in 1913, 22.92 per cent; of South Australia, Adelaide, 189,646 in 1911, 201,000 in 1913, 45.68 per cent; of Western Australia, Perth, 106,792 in 1911, 121,700 in 1913, 37.95 per cent; of Tasmania, Hobart, 39,937 in 1911, 40,000 in 1913, 19.83 per cent. The capital of the Northern Territory is Darwin; in 1911 it had 958 inhabitants, or 28.94 per cent of the censused persons in the territory. The table below shows the area in acres of the capital cities with suburbs, their estimated population in 1915, and their percentage of the total State population:

	Acres	Population		Total	Per cent.
		Male	Female		
Sydney	118,299	522,700	361,300	763,000	40.83
Melbourne	163,374	322,700	361,300	684,000	48.24
Brisbane	195,277	79,170	82,768	161,938	23.80
Adelaide	170,850	100,107	109,343	209,450	47.64
Perth	89,000	53,231	53,561	106,792	33.58
Hobart	46,730	18,557	21,281	39,838	19.82

The average natural increase per annum in the Commonwealth in the period 1904-13 was 69,596. The number of marriages, births, and deaths, with the rate per 1000 mean population, was as follows in 1915:

	Marriages		Births		Deaths	
	No.	Rate	No.	Rate	No.	Rate
N. S. W.	18,129	9.70	52,885	28.30	19,610	10.50
Vic.	12,832	9.00	85,010	24.55	15,823	11.10
Qld.	6,141	8.94	20,165	29.35	7,560	11.00
S. A.	3,965	9.01	11,798	26.81	4,694	10.67
W. A.	2,580	8.00	9,018	27.98	2,992	9.28
Tas.	1,600	8.03	5,845	29.32	2,015	10.11
N. Ter.	12	2.73	61	13.85	97	22.08
Fed. C. Ter.	4	1.22	47	19.05	17	6.89
Total.	45,263	9.14	134,829	27.24	52,808	10.67

The average net immigration per annum in the period 1904-13 was 25,951, distributed as follows: New South Wales (including the Federal Capital Territory), 12,931; Victoria, 3748; Queensland, 4280; South Australia (including the Northern Territory), 2040; Western Australia, 4578; Tasmania, -1626 (departures in excess of arrivals). In 1913, arrivals and departures oversea numbered 141,906 and 87,131 respectively; in 1914, 111,086 and 128,456; in 1915, 70,961 and 162,014. The decrease of arrivals and the increase of departures in 1914 and 1915 are largely due to the great war. In

1914, the excess of births over deaths was 86,263, and the excess of departures over arrivals 17,370; so that the total increase of population in that year is stated at 68,893 (the total population at the end of 1913 was estimated at 4,872,059 and at the end of 1914 at 4,940,952).

RELIGION AND EDUCATION. The leading religious denomination is the Church of England. The 1911 census made the following classifications: Christian, 4,274,414; non-Christian, 36,785; indefinite, 14,673; no religion, 10,016; object to state, 83,003; unspecified, 36,114. Adherents of the Church of England numbered 1,710,443; Roman Catholics, 921,425; Presbyterians, 558,336; Methodists, 547,806; Baptists, 97,074; Congregationalists, 74,046; Lutherans, 72,395; adherents of the Church of Christ, 38,748; adherents of the Salvation Army, 26,665.

The number of persons five years of age and upwards at the 1911 census was 4,019,372; of these 139,749 were not able to read, and 95,727 were not recorded in respect of literacy.

State schools, teachers (exclusive of sewing mistresses), pupils enrolled, and the average attendance are reported as follows for 1913:

	Schools	Teachers	Pupils	Av. At.
N. S. W.*	3,285	6,627	245,819	178,028
Vic.	2,218	5,734	218,712	157,140
Qld.	1,898	3,246	98,619	79,955
S. A.	815	1,627	58,656	48,319
W. A.	556	1,303	41,558	36,264
Tas.	481	897	26,919	21,174
N. Ter.	4	6	123	68
Total	8,647	19,440	685,406	515,948

\* Including the Federal Capital Territory.

In 1912, the enrollment was 662,576, and the average attendance 496,252; in 1911, 638,850 and 463,799. Private schools in 1913:

	Schools	Teachers	Pupils	Av. At.
N. S. W.	733	3,593	64,591	54,305
Vic.	519	1,846	49,549	40,000
Qld.	153	795	18,092	15,518
S. A.	164	638	12,362	9,281
W. A.	119	459	10,385	9,101
Tas.	88	320	6,275	4,434
N. Ter.	1	2	65	40
Total	1,777	7,653	161,269	132,679

In 1912, the enrollment at private schools was 164,085 and the average attendance 133,940; in 1911, 160,794 and 132,588.

The following figures show the number of teachers and students at the Australian universities in 1913:

	Students		
	Teachers	Matriculated	Total
Sydney	134	1,167	1,645
Melbourne	82	...	1,256*
Adelaide	49	415	720†
Tasmania (Hobart)	11	92	162
Queensland (Brisbane)	23	198	207
W. Australia (Perth)	12	118	182

\* Exclusive of 86 music students. † Exclusive of 318 music students.

PENSIONS. The first State in the Commonwealth to introduce old-age pensions was Victoria, whose legislation on the subject became operative Jan. 18, 1901. The pension system of New South Wales came into force Aug. 1, 1901, and that of Queensland July 1, 1908. In the latter year an act providing for old-age pensions

throughout Australia was passed by the Commonwealth Parliament, superseding the State acts; it was assented to June 10, 1908, and payment of old-age pensions began as from July 1, 1909. The act also provided for invalid pensions, the first payments of which were made Dec. 15, 1910. The age qualification for an old-age pension is 65 years or, in the case of permanent incapacitation for work, 60 years. For women the age qualification has been 60 years since Nov. 19, 1910. The age qualification for an invalid pension is 16 years in case of permanent incapacitation for work. The rate of pension for either old age or invalidity is fixed by the commissioner of pensions or his deputy and must not exceed £28 per annum or be such as to make the pensioner's total income exceed £52 per annum. The following table shows the number of pensioners and the amount paid in pensions during fiscal years ended June 30th:

	No. of Pensioners			Amount Paid
	Old-age	Invalid	Total	
1910	65,492	.....	65,492	£1,497,380
1911	75,502	7,451	82,953	1,868,684
1912	79,071	10,768	89,839	2,148,034
1913	82,943	13,739	96,682	2,289,048
1914	87,780	16,865	104,645	2,579,265

In addition to the amounts stated above there are payments to asylums for the maintenance of pensioners; these aggregated £13,287 in 1913 and £14,236 in 1914. Of the old-age pensioners on June 30, 1914, males numbered 37,346 and females 50,434; that is, the masculinity, or the number of males to each 100 females, was 74.05. The invalid pensioners on the same date comprised 5454 males and 8411 females, the masculinity being 100.51. During the year 1913-14 the total cost to the Commonwealth of administering the Old-age and Invalid Pensions Department was £46,946, or about 1.8 per cent of the amount paid in pensions.

**PRODUCTION.** The values of the products of the Commonwealth as officially estimated for several years are shown below in thousands of pounds sterling:

	1908	1910	1912	1913
Agricultural	37,150	39,752	45,754	46,260
Pastoral	47,259	56,993	51,615	57,866
Dairy, poultry, etc.	15,045	17,387	20,280	20,341
Forestry and fisheries	4,286	4,789	6,432	6,338
Mining	24,580	23,215	25,629	25,808
Manufacturing*	86,637	45,598	57,022	61,586
Total	164,957	187,784	206,732	218,199

\* These amounts differ from figures sometimes used which include certain products here classified with dairy farming and forestry.

**Agriculture.** The area under crop in Australia in 1913-14 was 14,683,012 acres, as compared with 13,038,049 acres in 1912-13, 11,893,838 in 1910-11, and 9,433,455 in 1905-06. These areas do not include lands under permanent artificially sown grasses, which amounted to 3,208,362 acres in 1913-14 and 2,987,419 acres in 1912-13. Of the area under crop in 1913-14, New South Wales had 4,567,592 acres (which amount to 2.230 per cent of the area of the State); Victoria, 4,391,321 acres (7.807 per cent); Queensland, 747,814 (0.174); South Australia, 3,169,559 (1.303); Western Australia, 1,537,923 (0.246); Tasmania, 264,140 (1.574); Northern Territory, 354; Federal Capital Territory, 4309

(0.738); Commonwealth, 14,683,012 (0.771). Area and production of the principal grain crops and hay in 1913-14:

Next to wheat the most important crop is hay, and a very large proportion of it is cereal grasses; in New South Wales, South Australia, and Western Australia the principal hay crop is wheat, in Victoria oats, and in Queensland alfalfa. The acreage of crops not included in the table above were as follows in 1913-14: green forage, 486,504; orchards and fruit gardens, 216,921; sugar cane, 160,976; potatoes, 174,262; barley, 222,564; vineyards, 61,197; all other, 128,519. Sugar cane is grown for sugar-making only in Queensland and New South Wales, and much more extensively in the former than in the latter. Of the acreage in 1913-14, Queensland had 102,803 acres of productive and 44,940 of unproductive cane; New South Wales, 6198 acres of productive and 7034 of unproductive. The output of sugar in Queensland in 1913-14 was 207,196 tons; in New South Wales, 17,295; total, 224,491. Sugar produced in Australia by colored labor decreased from 107,454 tons in 1904-5 to 6693 in 1912-13 and 8814 in 1913-14. See AGRICULTURE.

**Grazing.** The following figures for live stock relating to 1914 are taken from a statement published in 1916 by the government statistician of Queensland:

	Horses	Cattle	Sheep	Swine
N. S. W.	893,393	2,317,540	33,009,088	236,704
Vic.	552,058	1,362,542	12,051,685	243,196

1910	2,165,866	11,744,714	92,047,015	1,025,850
1900	1,609,654	8,640,225	70,602,995	950,349

Australia's pastoral wealth is chiefly in wool; the output for the season ended June 30, 1914, was valued at about £28,588,000. The bulk of the wool is exported, the quantity used in local woolen mills being little more than 1.5 per cent of the total production. The estimated output in 1913-14, stated as in the grease, was 711,134,203 pounds, as compared with 648,851,

913 in 1912-13 and 726,408,625 in 1911-12. The Commonwealth statistician notes that a shortage apparently occurred in the collection of these statistics, as the aggregate estimates fall considerably below the approximate totals obtained from oversea shipments together with the quantity used in local manufacture. The total so obtained represented 754,123,633 pounds for 1913-14, 668,667,078 for 1912-13, and 785,753,099 for 1911-12.

**Mining.** According to statistics published in 1916, the Commonwealth's mineral output (exclusive of building stone, slate, cement, etc.) was valued in 1914 at £22,488,138; the total for 1913 was £25,807,557, and for 1912 £25,629,238. The total for 1914 comprised the following values: gold, £8,763,895; coal, £4,306,558; copper, £2,309,647; tin, £758,081; silver, £373,517; other, £5,976,440. The following table shows the value of the most important minerals, and the total for all minerals, produced in 1913, and the grand total of mineral production in each of the States from the beginning of mining to the end of that year; comparative totals are also given for 1912 and 1901:

	Gold £	Coal £	Sil. Id.* £	Copper £

\* Silver and lead.

The largest gold production in Australia was in 1903, when the output amounted to £16,294,684. Since that year the total annual output has steadily declined.

In the ten-year period 1904-13 Western Australia contributed 54.05 per cent of the annual average output of gold; Victoria, 21.12; Queensland, 15.45; New South Wales, 7.24; Tasmania, 1.70; South Australia, 0.24; Northern Territory, 0.20.

The number of persons reported as engaged in mining of all kinds in 1913 was 92,262.

**COMMERCE.** Australian importation attained its maximum in 1913, with a value of £79,749,653; exportation in 1911, with £79,482,258. With the great war there came a sharp decline in imports and exports of merchandise, while the year 1915 was marked by a large increase in the exportation of precious metals. Imports of merchandise are reported at £72,641,000 and £68,500,000 in 1914 and 1915 respectively, and of bullion and specie at £1,305,000 and £863,000; exports of Australian produce, £62,843,000 and

£57,610,000, and of bullion and specie (including gold and silver in matte and gold ore) at £2,995,000 and £11,176,000. Reported value of principal domestic exports:

	1913	1914	1915
Wool . . . . .	£26,277,000	£18,375,000	£28,243,000
Preserved meat . . . . .	7,131,000	9,114,000	8,016,000
Copper . . . . .	2,879,000	2,142,000	2,866,000
Hides and skins . . . . .	5,520,000	4,147,000	2,806,000
Lead . . . . .	1,848,000	1,819,000	2,720,000
Butter . . . . .	3,565,000	2,655,000	1,820,000
Wheat . . . . .	7,987,000	9,996,000	289,000

Imports, domestic exports, and total exports are shown in the table below. The figures for 1914 are for the first six months only; in that year the trade year was changed from the calendar to the fiscal year ending June 30th.

	Exports		
	Imports	Domestic	Total
1911 . . . . .	£66,967,488	£76,205,210	£79,482,258
1912 . . . . .	78,158,600	75,961,563	79,096,090
1913 . . . . .	79,749,653	75,188,147	78,571,769
1914 . . . . .	39,777,497	36,265,764	37,930,087
1914-15 . . . . .	64,380,747	58,273,110	60,600,302

In the year 1914-15, imports and exports of specie amounted to £434,601 and £1,994,400 respectively. Leading imports in 1914-15, in thousands of pounds sterling: metal manufactures, 9433; cotton and linen piece goods, 4267; apparel (exclusive of hats and caps), 3578; machinery, 3501; drugs, chemicals, and fertilizers, 2426; timber, 2150; silk piece goods, 2082; oils in bulk, 1893; woolens, 1850; bags and sacks, 1552; tea, 1529; spirits, 1291; tobacco, 902; arms and explosives, 744; boots and shoes, 624; books, 608; agricultural implements, 513. Principal exports in 1914-15, in thousands of pounds sterling: wool, 22,088; beef, 4990; hides and skins, 3522, mutton and lamb, 3414; butter, 2687; copper matte, ingots, ore, and bars, 2303; lead, pig and in matte, 2009; gold specie, 1941; tinned meat, 1854; tallow, 1571; leather, 1183; wheat, 859; timber, 795; silver, bullion, ore, and in matte, 755; coal, 721; gold, bullion, and in matte, 683; zinc concentrates, 613; live animals, 541; rabbits and hares, 531; flour, 509; tin ore, 187. The outbreak of the great war caused to be prohibited the exportation of many articles or restricted their exportation to British dominions or countries of the Allies.

Australian commerce with the more important countries is shown below for the years 1913 and 1914-15, in thousands of pounds sterling:

	Imports		Exports	
	1913	1914-15	1913	1914-15
United Kingdom . . . . .	47,616	37,905	34,805	38,548
United States . . . . .	9,523	9,552	2,631	4,947
British India . . . . .	2,964	2,646	1,355	1,425
New Zealand . . . . .	2,514	2,095	2,357	2,809
Japan . . . . .	919	1,393	1,429	1,967
Germany . . . . .	4,957	1,297	6,378	473
Ceylon . . . . .	969	977	1,124	435
Java . . . . .	714	787	687	384
Belgium . . . . .	2,359	524	7,466	796
France . . . . .	625	241	9,684	1,280
Union of So. Africa . . . . .	127	118	1,941	2,023

Share of the States in the foreign trade of 1914-15: New South Wales, £27,323,243 imports and £28,107,025 exports; Victoria, £20,997,294 and £12,357,334; Queensland, £6,428,688 and £12,015,484; South Australia, £4,750,361 and £3,566,335; Western Australia, £3,986,198 and

£3,120,798; Tasmania, £811,255 and £420,007; Northern Territory, £83,708 and £13,319.

**SHIPPING.** Merchant marine in 1914: steamers, 1165 of 329,105 tons; sail, 1632 of 120,532 tons; total, 2797 vessels of 449,637 tons, as compared with 2772 of 412,423 tons in 1910. Shipping entered and cleared in oversea trade:

	Entered		Cleared	
	Vessels	Tons	Vessels	Tons
1910	1988	4,607,820	2060	4,725,326
1912	2035	5,163,357	2017	5,111,957
1913	2014	5,371,581	1971	5,230,417
1914-15	1568	4,174,955	1648	4,424,308

**COMMUNICATIONS.** In the eastern, southeastern, and southern parts of the continent there is a considerable network of railway lines converging upon the principal ports. The ports are connected by lines running more or less parallel to the coast. In the east lines radiating from Townsville, Rockhampton, Brisbane, and Sydney extend inland for distances ranging up to 600 miles. In the southeast numerous lines converge upon Sydney and Melbourne. In the south four main lines, with branches, extend from Melbourne, and one main line, also with branches, runs north from Adelaide nearly 700 miles, while another extends southeast to meet the line from Melbourne at the Victorian border. The main interstate line, connecting Brisbane and Adelaide by way of Sydney and Melbourne, extends 1790 miles. In Western Australia there is a connected system of lines between the ports and the inland districts that are being developed. In Tasmania the principal towns are connected by rail. The longest possible railway journey in Australia on one continuous line is from Longreach in Queensland to Oodnadatta in South Australia, the distance being 3303 miles.

The length of government railways (that is, the railways owned by the Commonwealth government and by the State governments) open to traffic June 30, 1915, is reported at 18,999 miles. The cost of construction and equipment up to June 30, 1913 (for 17,775 miles) was £160,557,160; the gross receipts in 1914-15 were £20,743,029, and working expenses £15,140,230. The following table shows the railway mileage in operation June 30, 1914, for government lines and Dec. 31, 1913, for private lines (a Federal railways; b State railways; c private railways open to general traffic; d total open to general traffic; e private railways open for special purposes; f total railway mileage):

<b>Cwth.</b>	<b>629</b>	<b>17,703</b>	<b>1,188</b>	<b>19,470</b>	<b>1,059.5</b>	<b>20,529.5</b>

Of the total length of railway, 4602 miles were 5 ft. 6 in. gauge (chiefly in Victoria); 4126.5 miles 4 ft. 8.5 in. gauge (entirely in New South Wales and the Federal Capital Territory); 11,408 miles 3 ft. 6 in. gauge (chiefly in Queensland and Western Australia); 122 miles 2 ft. 6 in. gauge (in Victoria); and 271 miles 2 ft. gauge.

Towards the end of 1916 it was reported that 917 miles of the East to West transcontinental line from Kalgoorlie to Port Augusta had been laid and that but 41 miles remained for its completion. Up to July 29, 1916, the cost of this line had amounted to £4,255,961 (\$20,683,970), exclusive of rolling stock and stores on hand. Rolling stock had cost £809,745 (\$3,352,361).

At the end of 1913, the number of telegraph offices was 4624, with 46,218 miles of line and 108,931 miles of wire; post and receiving offices, 8409.

**FINANCE.** The estimated Commonwealth revenue and expenditure for the fiscal year 1915-16 amounted to £23,540,000 and £74,108,964 respectively, the revenue including £6,290,000 customs and excise, which as expenditure was allocated to the several States. The largest estimated disbursement was for military and naval operations in connection with the great war, amounting to £45,749,450. For the fiscal year 1914-15, the revenue was reported at £22,411,711 and the expenditure at £38,047,963. The final, official figures for revenue and expenditure are given below:

Revenue	1910-11	1913-13	1913-14
	£	£	£
Customs	10,507,080	13,055,925	12,652,737

<b>All States</b>	<b>47,296</b>	<b>47,018</b>	<b>46,562</b>	<b>49,095</b>

In addition to the ordinary expenditure, as given in the table above, the States each year make disbursements from loan funds for railways, water supply and sewerage, roads, harbors, advances to settlers, and other public works and purposes. Such expenditure by New South Wales in 1913-14 amounted to £9,126,844; Victoria, £3,276,994; Queensland, £2,190,150; South Australia, £2,762,686; Western Aus-

tralia, £2,883,169; Tasmania, £498,141; all States, £20,737,984, as compared with £18,429,274 in 1912-13 and £3,424,475 in 1904-5.

Public debt of the States June 30, 1914: New South Wales, £116,695,031; Victoria, £66,130,726; Queensland, £54,523,506; South Australia, £33,564,332; Western Australia, £34,420,181; Tasmania, £12,265,012; total, £317,598,788, as compared with £294,472,486 in 1913 and £230,738,671 in 1905. Aggregate State sinking funds in 1914 amounted to £7,784,961.

NAVY. The royal Australian navy constitutes one of the three units of the British eastern fleet. It is controlled by the Commonwealth government in peace and by the British government in war. In April, 1915, the navy comprised the following commissioned vessels: *Australia*, battlecruiser, 19,200 tons, 44,000 h. p.; *Childers* and *Countess of Hopetoun*, first class torpedo boats; *Encounter*, light cruiser, 5880 tons, 12,500 h. p.; *Gayundah*, gunboat, 360 tons, 400 h. p.; *Melbourne*, light cruiser, 5600 tons, 22,000 h. p.; *Parramatta*, torpedo-boat destroyer, 700 tons, 12,000 h. p.; *Pioneer*, light cruiser, 2200 tons, 7000 h. p.; *Protector*, gunboat, 920 tons, 1641 h. p.; *Sydney*, light cruiser, 5600 tons, 22,000 h. p.; *Tingira*, boys' training ship, 1800 tons; *Una* (late *Comet*), gunboat, 950 tons, 1350 h. p.; *Warrego* and *Yarra*, torpedo-boat destroyers, each 700 tons, 12,000 h. p.; AE2, submarine, 800 tons, 1750 h. p. Building in April, 1915, were: *Brisbane*, light cruiser, 5600 tons, 22,000 h. p., at Sydney; *Derwent*, torpedo-boat destroyer, 700 tons, 12,000 h. p., at Sydney; *Karumba*, oil-supply ship, 3000 tons, in England; *Platypus*, submarine depot ship, 3100 tons, in Scotland; *Swan* and *Torrens*, torpedo-boat destroyers, each 700 tons, 12,000 h. p., at Sydney. The strength of the naval forces (permanent and reserve) in April, 1915, was 9423 officers and men.

GOVERNMENT. Australia is a Federal Commonwealth within the British Empire. The executive authority is vested in the British sovereign acting through a governor-general, whom the sovereign appoints and who is assisted by a responsible ministry, the executive council. The legislative power is exercised by a parliament of two chambers, the Senate and the House of Representatives. Senators, 36 in number (six from each State), are elected for six years, and representatives for three years — all by universal suffrage. The number of representatives is as nearly as may be twice as great as that of senators, the number from each State being in proportion to population, but no State having less than five. On the basis of the 1911 census, New South Wales has 27 representatives; Victoria, 21; Queensland, 10; South Australia, 7; Western Australia, 5; Tasmania, 5; total, 75. The Governor-General in 1916 was Sir Ronald Craufurd Munro-Ferguson, G. C. M. G., who assumed office May 18, 1914, in succession to Thomas Baron Denman, G. C. M. G. Ministry in 1916 (formed Oct. 27, 1915, in succession to the ministry of Andrew Fisher, who became high commissioner for Australia in London): Prime minister and attorney-general, William Morris Hughes; minister for external affairs, Hugh Mahon; home affairs, King O'Malley; defense, George Foster Pearce; trade and customs, Frank Gwynne Tudor; navy, Jens August Jensen; postmaster-general, W. Webster; treasurer, W. G. Higgs; vice-president of the executive council, Albert

Gardiner; honorary minister, Edward John Russell.

## HISTORY

THE QUESTION OF CONSCRIPTION. On February 18th, the Premier of Australia, Mr. William M. Hughes (q.v.), was appointed a member of the Canadian Privy Council, this being the first occasion upon which a member of one of the Overseas Dominions became also a member of the Canadian government. The vigorous campaign of Mr. Hughes in Canada, and afterwards in England, for the solidification of the Empire and the relentless prosecution of the war, and especially his advocacy of conscription, offended an important element in the Labor party, which in his absence passed resolutions condemning his attitude and pronouncing against conscription. Upon his return he urged the immediate enactment of conscription and the Labor party split at once upon the issue, many members of the Commonwealth Parliament and some of the State representatives deciding for conscription, while the majority of the party opposed it. The programme of the Labor party in the three largest States, New South Wales, Queensland, and Victoria, involved opposition to conscription, and in New South Wales, from which Mr. Hughes was a representative, the Political Labor League expelled him from membership. Four members of the Commonwealth cabinet resigned on account of the Premier's conscriptionist policy and anti-conscriptionists also resigned from State cabinets that favored conscription. Before the referendum, the government, counting on success at the polls, drafted single men between the ages of 21 and 35, under the provision empowering it to do so for home defense, but with the ulterior design of dispatching them to the overseas service. On the one hand the conscriptionists argued that Australia being the most democratic of all countries had the most to fear from German domination. On the other the opponents of conscription advanced many objections, ranging from the Socialist condemnation of war in general to the contention that Australian independence was menaced. It was feared that married men would be drafted, and that there would not be enough workers left to carry on the food-producing industries. Australia had already enlisted 320,000 men for war service. The arrival of a ship load of Maltese laborers aroused the suspicion that the contract labor law was being evaded, and that well-paid Australian workmen would be drafted into military service and their places filled by cheap alien laborers. The bill for the referendum passed the Australian House of Representatives on September 21st, and the question was submitted to the voters on October 28th. The number who had voluntarily enlisted was 103,000 and the number that it was estimated would still be needed by July 1, 1917, was 100,000. Available men, that is the "fit, single and without dependents," were placed at 125,000. The government wished to resort to conscription only to supplement the voluntary enrollment, which was to be continued. Enough men to supply the deficit were to be called by conscription month by month. The age limit was 21 and the following classes were to be exempt: (1) Only sons; (2) single men who were the sole supports of dependents; (3) families from whom a member had volunteered to be exempt for one-half of the remaining members.

There were to be military courts to hear appeals for exemption. The vote on October 28th was against the measure. Figures published on November 6th showed a majority of 73,000 against conscription out of a total of 2,087,000 votes counted. This was explained by the democratic dislike of coercion, by the belief that the war was nearly over, and by the dissension in the Labor party as to methods of execution.

**THE GOVERNMENT WHEAT BOARD.** Among the important economic measures taken as a result of war conditions may be mentioned the Federal control of the wheat supply. Toward the close of 1915 it was announced that the government would take complete control of the wheat crop. It was to use the existing machinery for distribution, employing the present wheat agents, selling firms, and shipping companies. The management was vested in a central committee consisting of the Prime Minister, and the ministers for agriculture in Victoria, New South Wales, South Australia, and West Australia. There was much discussion of the advance price fixed for the farmers and some criticism, but of details rather than principle, for the fixing of prices had been going on for more than a year, boards for that purpose having been in operation in every State. Early in March the Commonwealth Wheat Board fixed the price of grain for millers at 4s. 9d. per bushel, which caused much complaint among the farmers as unfair. This was followed by the announcement of a fixed price for flour and bread.

**INDUSTRIAL UNREST.** During the first quarter of 1916 the number of labor disputes, according to the figures published, was double that of the corresponding period in the year before, though only half as large as during the quarter immediately preceding. The increase of labor difficulties in the country where conditions of labor are especially favorable gave rise to much discussion of the causes. A great many of the applications to wage boards for increase of wages in 1915 and 1916 were due to the high cost of living, but there were other more permanent causes alleged for the general situation. For example, it was pointed out that an active, progressive labor community in possession of political power, possessing a widespread popular system of education and a very high degree of industrial education would naturally raise its demands in proportion to its higher standard of living. Delays in the awards of wage boards were a fruitful source of unrest. An instance was cited in 1916 of one wage board that had taken two years to render a decision and of another that had taken five months. As awards were generally made for a period of three years, further delay was naturally exasperating. During the war there was also considerable delay as a result of the scarcity of legal or technical advisers. Again the decisions of the Commonwealth Arbitration Court were often rendered only after long delay and many of them were based on highly technical grounds, causing further dissatisfaction. Finally the difficulty had been accentuated by the dissension between the industrialist and parliamentary members of the Labor party. The former were dissatisfied with the moderate policy of the parliamentary group, and demanded more aggressive action. They were supported by the more energetic element in the party at large. The Industrial Workers of the World also played a part in stirring up

labor troubles, though it had not yet become strong in numbers or apparently acquired much influence over the main body of the Labor party, for some of its chief members were defeated for nomination as Labor candidates. For Australia's part in the great war, see the article **WAR OF THE NATIONS.**

**AUSTRIA-HUNGARY,** or the **AUSTRO-HUNGARIAN MONARCHY.** A monarchy of central Europe, consisting of the Austrian Empire, the Hungarian Kingdom, and the territory of Bosnia and the Herzegovina. The capital of Austria is Vienna, and of Hungary, Budapest. The examining and advisory body known as the Delegations, and acting for Austria and for Hungary in respect of their common affairs, convenes alternately at Vienna and Budapest. The permanent residence of the sovereign is Schönbrunn Castle at Vienna.

**AREA AND POPULATION.** The area of the monarchy is 261,241 square miles, which is somewhat smaller than the State of Texas. The population in 1916 was probably in excess of 52,500,000.

The population of the monarchy in 1910, exclusive of foreigners in Austria and the military in Bosnia and the Herzegovina, is stated at 50,748,403. Of these, German was the vernacular of 12,010,669; Magyar, 10,067,992; Bohemian, Moravian, or Slovak, 8,475,292; Croatian or Serbian, 5,545,531; Polish, 5,019,496; Rumanian, 3,224,755; Italian and Ladin, 804,271. Foreigners in Austria in 1910 numbered 608,062 (against 517,903 in 1900).

In 1910 Austria had 151 cities and towns with more than 10,000 inhabitants, and 7 with more than 100,000; Hungary proper, 85 and 2; Croatia and Slavonia, 7 with more than 10,000. Vienna had 2,031,498 inhabitants at the 1910 census, and Budapest 880,371.

Marriages, births, and deaths are shown in the following table:

		Marriages	Births		* Deaths
			Living	Still	
Austria	1910	214,970	923,545	23,275	602,046
	1911	217,378	898,702	22,243	628,805
	1912	212,187	903,407	22,275	592,426
	1913	195,524	863,690	.....	588,654
Hungary	1910	179,537	742,899	15,667	490,689
	1911	193,482	732,767	15,149	524,496

	1913	.....	† 82,333	...	‡ 54,473

\* Exclusive of stillbirths. † Total births. ‡ Inclusive of stillbirths.

In Austria the marriage rate per thousand inhabitants was 7.38 in 1912, as compared with an average of 7.86 in 1901-5; living birth rate, 31.41 and 35.64; illegitimate living birth rate, 3.71 and 4.57; stillbirth rate, 0.77 and 0.97; death rate, 20.60 and 24.29; rate of excess of living births over deaths, 10.81 and 11.35. The actual number of living births in excess of deaths in 1912 was 310,981, as compared with an average of 304,030 in 1901-5. The percentage of illegitimate births was 11.82 in 1912, varying from 3.93 in Dalmatia to 36.70 in Carinthia.

In Hungary the marriage rate was 8.6 in 1912, as compared with an average of 8.8 in 1901-5; living birth rate, 36.3 and 37.4; percentage of stillbirths, 2.1 and 2.0; percentage of illegiti-

**EMPEROR CHARLES I**  
Successor of Francis Joseph

AUSTRIA-HUNGARY

mate births, 9.2 and 9.4; death rate, 23.3 and 26.4. The excess of living births over deaths in Hungary was 234,751 in 1913 and 274,169 in 1912, as compared with an average of 217,097 in 1901-5. The percentage of illegitimate births in Hungary in 1913 was 9.1; in Hungary proper, 9.3; in Transylvania, 9.9; in Croatia and Slavonia, 7.7. The highest percentage of illegitimate births was in Budapest and Agram, each with 27.2.

Oversea emigration in 1913 is reported at 309,950 (from Austria, 194,462). The United States was the destination of 254,825; Canada, 29,460; Argentina, 24,085. In the five-year period 1909-13, oversea emigration amounted to nearly 1,242,000.

**EDUCATION.** Elementary instruction is free and compulsory in both Austria and Hungary. In 1912 children of school age in Austria numbered 4,947,724; pupils at school, 4,471,393; elementary schools, 23,247 (including 1285 private schools); teachers, 107,374; training colleges, 149. German was the language used in 8508 elementary schools in 1912; Czech, 5367; other Slav languages, 7809; Italian, 697; Rumanian, 185; Hungarian, 5; other languages, 4; more than one language, 278.

For secondary education, the gymnasias and realschulen (including certain private schools) numbered 370 and 148 respectively in 1913-14, the former having 111,861 students and the latter 48,892. Forty of the gymnasias were for female students, who numbered 5871.

At each of the seven government technical high schools, teachers and students were as follows in the winter semester of 1913-14: Vienna, 183 and 3177; Prague (German), 86 and 900; Prague (Bohemian), 151 and 2817; Brunn (German), 102 and 924; Brunn (Bohemian), 73 and 569; Graz, 54 and 817; Lemberg, 98 and 1791; in addition, the Vienna agricultural high school had 86 teachers and 1135 students. In Austria eight universities are maintained by the government; teachers and students in the winter semester of 1913-14 were as follows: Vienna (German), 666 and 10,310; Prague (German), 225 and 2282; Prague (Bohemian), 249 and 4713; Graz (German), 199 and 2203; Innsbruck (German), 139 and 1480; Lemberg (Polish), 186 and 5871; Cracow (Polish), 195 and 3444; Czernowitz (German), 61 and 1194. Of the total number of students at the Austrian universities in 1913-14, about 8.5 per cent were women. University attendance declined rapidly after the beginning of the great war. Teachers and students at the University of Vienna in the summer semester of 1915 are reported to number 638 and 5160 respectively: Prague (German), 174 and 878; Graz, 168 and 784; Innsbruck, 115 and 649.

In Hungary in 1913 public instruction was provided in the following institutions: 2162 infant schools, 18,507 day elementary schools, 540 higher primary schools, 107 normal schools, 197 gymnasias, 49 realschulen, 35 higher schools for girls, 4 universities, 10 law colleges, 47 theological schools, 72 special schools of mining and agriculture, 200 special schools of industry and commerce, and other establishments. In the 16,861 day elementary schools in Hungary proper, there were at the end of the school year 1912-13 1,937,814 pupils (these figures include 246 private schools with 18,018 pupils); total enrollment for the year, 2,079,867.

The University of Budapest had 7808 students

at the end of the winter semester, and 7126 at the end of the summer semester, of 1912-13. See AGRICULTURAL EDUCATION.

**AGRICULTURE.** The average annual yield of wheat during the period 1905-14 is calculated at about 16,072,000 metric quintals in Austria and 46,072,000 in Hungary (one quintal = 220.46 lbs.); rye, 26,763,000 and 12,759,000; oats, 22,828,000 and 12,733,000; corn, 3,988,000 and 45,330,000; barley, 16,322,000 and 15,070,000; sugar beets, 63,871,000 and 30,353,000; potatoes, 132,848,000 and 52,864,000; hops, 135,560 and 9530; tobacco, 66,950 and 670,350; hemp fibre, 176,600 and 590,000; hemp seed, 134,500 and 230,900; flax fibre, 349,300 and 130,600; linseed, 236,700 and 58,000; rape seed, 246,800 and 216,000; wine, 4,776,000 and 4,481,000 hectolitres (one hectolitre = 26.4178 gallons); silk cocoons, 2,214,000 and 1,767,000 kilograms (one kilogram = 2.2046 lbs.). The area in hectares (one hectare = 2.47104 acres) and the yield in metric quintals are reported as follows for some of the more important crops in Austria (excluding Galicia and the Bukowina in 1914):

	Hectares		Quintals	
	1913	1914	1913	1914
Wheat	1,212,892	671,980	16,227,547	10,848,573
Rye	1,968,602	1,269,702	27,044,707	18,988,084
Barley	1,092,181	699,744	17,501,568	12,727,946
Oats	1,904,718	1,147,189	26,773,770	19,176,435
Corn	285,531	189,668	8,879,655	2,736,083
Su. beets	254,689	242,646	69,619,875	67,748,491
Potatoes	1,275,651	717,767	115,519,419	77,584,278

Similar figures for Hungary (including Croatia and Slavonia):

	Hectares		Quintals	
	1913	1914	1913	1914
Wheat	3,483,206	3,790,000	45,789,786	30,741,000
Rye	1,281,496	1,188,000	18,023,917	11,801,000
Barley	1,251,496	1,176,000	18,023,917	14,682,000
Oats	1,270,652	1,147,189	15,881,544	11,801,000
Corn	2,918,767	2,434,252	53,603,084	43,768,820
Su. beets	182,088	177,744	48,650,428	40,148,083
Potatoes	691,051	612,449	54,506,086	53,143,261

**MINING AND METALS.** For Austria no later figures for mineral production can be had than those given in the preceding YEAR BOOK, but some further details may be added. As noted in the 1915 volume, the value of mining products (exclusive of salt, petroleum, etc.) was 371,442,426 kr. in 1913. The share of Bohemia in the 1913 mining output was valued at 175,452,092 kr. (lignite 110,023,337, coal 47,637,749, iron ore 11,784,850, silver ore 3,865,466); Silesia, 79,858,949 kr. (coal 79,853,252 kr.); Styria, 46,219,005 kr. (lignite 29,105,724, iron ore 16,208,400, graphite 791,081); Moravia, 26,616,049 (coal 24,937,859, lignite 1,013,249, graphite 630,149); Galicia, 18,864,865 kr. (coal 16,702,192, lead ore 1,484,269); Carinthia, 7,813,545 kr. (lead ore 4,508,167, zinc ore 1,739,849, lignite 1,019,987); Carniola, 6,548,767 (lignite 3,350,428, quicksilver ore 3,175,455). The production of petroleum (and ozocerite) in Galicia declined from 20,884,569 metric quintals in 1909 to 11,458,163 in 1912; the value, however, increased from 34,928,285 kr. to 59,695,236 kr. The 1912 output consisted of 11,441,332 metric quintals of petroleum, valued at 57,234,546 kr., and 16,831 quintals of ozocerite, valued at 2,460,690 kr. The output of refined or prepared salt in 1913 was 3,375,629 quintals, valued at 46,313,806 kr.

Of the salt 1,518,146 quintals, valued at 17,415,028 kr., were produced in Galicia, and 1,011,917 quintals, valued at 16,689,565 in Upper Austria. For 1915 the output of coal is reported at 16,083,000 metric tons, and lignite 22,027,100 tons.

The value of furnace products in Austria was 181,607,752 kr. in 1913. These products included in 1913: Raw iron, 1,757,864 metric tons, valued at 143,457,727 kr.; lead, 22,312 tons, 10,706,814 kr.; zinc, 19,508 tons, 10,366,981 kr.; copper, 3685 tons, 5,986,409 kr.; silver, 54,433,487 kilograms, 5,264,916 kr.; gold, 283,587 kilos, 919,773 kr. The share of Styria in the furnace products of 1913 was valued at 50,875,441 kr. (raw iron 48,385,776, zinc 2,483,598); Moravia, 41,810,243 kr. (raw iron 39,990,055, copper 1,490,032); Bohemia, 35,710,103 kr. (raw iron 28,187,476, silver 4,348,911, lead 1,940,030); Silesia, 14,978,008 (all raw iron); Trieste, 11,173,002 (all raw iron); Galicia, 9,384,017 (zinc 7,883,383, lead 1,174,472); Carinthia, 6,542,965 (lead 6,404,987); Salzburg, 5,237,054 (copper 4,309,060); Carniola, 5,141,768 (quicksilver 3,878,600, lead 1,187,325).

In Hungary, the average annual value of mining and furnace products in the period 1901-5 was 104,187,000 kronen; in 1906-10, 139,208,000 kr.; in the year 1911, 160,276,000 kr.; in 1912, 167,830,000 kr.; in 1913, 185,657,000 kr. These figures, and those also in the table below, do not include the original value of ore that has been smelted into metal whose value is included. The quantity (in metric tons) and the value (in thousands of kronen) of the more important mining and furnace products of Hungary were as follows in 1912 and 1913:

	Metric Tons		1000 Kronen	
	1912	1913	1912	1913
Lignite .....	8,131,307	8,801,160	78,974	88,257

COMMERCE. Authentic details of Austro-Hungarian foreign commerce are available not later than for the year 1913. In the 1914 special trade of the common customs territory, total imports are reported at about 2,753,184,000 kronen, and total exports at about 2,015,904,000 kr.

SHIPPING. The merchant marine of Austria is reported to have included on Jan. 1, 1914, 198 sea-going vessels of 451,150 tons, as compared with 192 of 407,016 tons on Jan. 1, 1913. The reported number of Austrian coasting vessels on the latter date was 1603 of 35,428 tons, and of fishing boats, etc., 14,969 of 28,808 tons. Of the total 1914 tonnage, 422,368 tons were steam. The merchant marine of Hungary in 1913 consisted of 545 vessels of 144,433 tons; of these, 68 were sea-going steamers of 131,763 tons. In 1913 there were entered at Austrian seaports 173,511 vessels of 27,877,722 tons; of these, 161,088 of 25,445,061 tons (i.e., 91.27 per cent) were

Austro-Hungarian. Cleared at Austrian seaports in 1913, 173,377 vessels of 27,857,112 tons; of these, 161,282 of 25,417,590 tons (91.24 per cent) Austro-Hungarian. Entered at Hungarian (including Croatian) seaports in 1913, 31,857 vessels of 4,930,905 tons; cleared, 31,836 vessels of 4,924,734 tons. Trieste and Fiume are the principal merchant seaports of Austria-Hungary.

COMMUNICATIONS. Besides the railways the Danube River and its affluents are important avenues of transportation in Austria-Hungary. The length of railway in operation on Jan. 1, 1914, is reported at 47,199 kilometers (29,328 miles), of which 23,787 km. in Austria, 21,870 km. in Hungary, and 1942 in Bosnia and the Herzegovina. Most of the railway is under government operation. In Austria at the end of 1912, the length of telegraph lines (including government, railway, and private lines) was 47,192 km.; length of wire, 238,918 km.; offices, 7088. The government lines included 40,581 km.; wire, 157,629 km.; offices, 4717. In Hungary in 1913 there were 26,388 km. of telegraph line, with 160,712 km. of wire and 5171 offices (of which 2801 were government offices). The length of telegraph line in Bosnia and the Herzegovina in 1913 was 3501 km., with 10,627 km. of wire and 321 offices. Post offices in 1913: In Austria, 9985; in Hungary, 6610; in Bosnia and the Herzegovina, 249; in foreign territory, 36.

FINANCE. The standard of value is gold. The monetary unit is the krone (crown); its par value is 20.263 cents. The cost of administering the common affairs of the monarchy is borne by Austria and by Hungary in a proportion agreed to by their parliaments and sanctioned by the Emperor-King. The agreement renewed for ten years in 1907 provides that the net proceeds of the common customs be applied to the common expenditure, and that the remaining expenditure be satisfied in the proportion of 63.6 per cent by Austria and 36.4 per cent by Hungary. Authentic information covering government revenue and expenditure since 1914 is not accessible on account of the great war. The budget estimates for the year ending June 30, 1915, for the common government were as follows, in thousands of kronen: Expenditure, 778,244; customs revenue, 216,455; and the contributions from Austria and Hungary, 357,298 and 204,491, respectively.

In the following table are shown the revenue and expenditure, in thousands of kronen, of the Austrian government and the Hungarian government:

	Austria		Hungary	
	Rev.	Expend.	Rev.	Expend.
1908 ...	2,388,384	2,373,894	1,531,868	1,616,245
1909 ...	2,795,703	2,888,648	1,750,783	1,721,564
1910 ...	2,895,492	2,901,364	2,074,548	1,901,666
1911 ...	3,082,732	3,004,035	1,830,780	1,768,849
1912 ...	3,173,309	3,184,861	1,954,877	2,018,261
1913 ...	3,486,079	3,461,133	2,072,809*	2,072,754*

\* Estimate.

In Austria, the estimated revenue, according to the budget for the year ending June 30, 1915, amounted to 3,460,987,902 kronen (3,194,355,951 kr. ordinary, 266,631,951 kr. extraordinary), and the estimated expenditure 3,460,726,156 kr. (3,064,672,060 kr. ordinary, 396,054,096 kr. ex-

traordinary). In Hungary, the estimated revenue for the year ending June 30, 1915, was 2,264,157,883 kr. (1,953,605,613 kr. ordinary), and the estimated expenditure 2,264,096,830 kr. (1,876,270,912 kr. ordinary). In Bosnia and the Herzegovina, the estimated revenue and expenditure for 1913 were 92,997,594 kr. and 92,987,887 kr. respectively.

According to the terms under which the union of Austria and Hungary was effected in 1867, no debts are contracted by the common government. The total general debt, contracted before that date, amounted on Jan. 1, 1915, to 5,124,820,435 kr., of which 5,096,866,315 kr. formed the consolidated debt. The Austrian debt increased from 7,467,346,388 kr. on Jan. 1, 1914, to 12,836,044,942 kr. on Jan. 1, 1915. Of the latter sum, the consolidated debt comprised 7,131,951,135 kr.; during the year the floating debt increased from 347,135,730 kr. to 5,704,093,807 kr. The Hungarian debt in 1912 was 5,520,569,583 kr., besides arrears and outstanding paper amounting to 1,072,276,486 kr. This debt, like the Austrian, has increased enormously since the beginning of the great war. See FINANCIAL REVIEW.

**GOVERNMENT.** Under the constitutional compromise of 1867, the administration of the monarchy is directed by the Emperor-King, acting through three ministers, for foreign affairs, finance, and war. The admiralty is a department of the ministry of war. The ministers are responsible to the two Delegations; these bodies, consisting of 60 members each, are elected by the Austrian and Hungarian parliaments respectively and convene each year, alternately at Vienna and Budapest. They examine the requirements of the common services of the monarchy and advise the parliaments as to necessary appropriations. The common government deals with finance relating to the monarchy as a whole, foreign affairs, the diplomatic, consular, postal, and telegraphic services, and certain state monopolies. Austria and Hungary have each a representative parliament of two houses and a responsible ministry. The Austrian parliament is termed the Reichsrat, and the Hungarian the Országgyűlés. Each of the Austrian crownlands has a diet, and there is also a diet for Croatia and Slavonia. The administration of Bosnia and the Herzegovina is directed by the common ministry of finance.

The Emperor-King Francis Joseph I died Nov. 21, 1916. He was born Aug. 18, 1830, and became Emperor of Austria Dec. 2, 1848, and King of Hungary June 8, 1867. He was succeeded by the heir presumptive, the Archduke Charles Francis Joseph, born Aug. 17, 1887, son of the late Archduke Otto Francis Joseph, who was a nephew of Francis Joseph I. The new sovereign ascended the throne as Emperor Charles (Karl) I of Austria and King Charles IV of Hungary. Charles was married Oct. 21, 1911, to Zita, Princess of Bourbon of Parma, who was born May 9, 1892. The heir apparent of the new sovereign is the Archduke Francis Joseph Otto, born Nov. 20, 1912. The father of the Emperor-King Charles was a younger brother of the late heir presumptive, the Archduke Francis Ferdinand. The assassination of Francis Ferdinand and his morganatic wife, the Duchess of Hohenburg (Countess Chotek), by a Serb at Sarajevo, Bosnia, on June 28, 1914, was made by the Austro-Hungarian government the occasion of an uncompro-

misingly hostile attitude toward Serbia, which resulted in the Austro-Hungarian declaration of war on Serbia July 28th and the German declaration of war on Russia August 1st.

The common ministry early in 1916: Premier and minister for foreign affairs, Stephan Burian von Rajesz, appointed Jan. 14, 1915, in succession to Leopold (Count) von Berchtold; finance, Dr. Ernst von Koerber, appointed in February, 1915; war, Gen. Alexander (Ritter) von Krobatin, appointed Dec. 10, 1912. Premier of the Austrian ministry, Karl (Count) Stürgkh; Premier of the Hungarian ministry, Stephan (Count) Tisza. See below under *History*.

## HISTORY

**CABINET CHANGES.** Count Stürgkh (q.v.), the Austrian Prime Minister, was shot and killed at a hotel in Vienna on October 21st, by Dr. Friedrich Adler, son of the Socialist Deputy to the Reichsrat, Dr. Victor Adler. The murderer, who held very radical views and was reported to be of an unbalanced mind, admitted that he had acted merely from political motives. The Premier's refusal to convoke parliament was thought to have precipitated the act. Herr von Koerber, former Premier and reputedly of Pan-German tendencies, succeeded to the office and his continuation was approved by the new Emperor, but his ministry lasted only till December 13th. The causes of his resignation were not known and were the subject of much speculation in the press, some saying that von Koerber wished to reassemble the Reichsrat, while a group of Radicals headed by Herr Wolf were opposed—a doubtful theory, since the opposition of the Radicals had been pronounced when the ministry was formed (November 1st). Others held that Germany was insisting on the cession of Triest by Austria to Italy and that von Koerber had resigned in disapproval. But this too seemed improbable since the retention of the port of Triest was essential to German domination in middle Europe and even more important to Germany than to Austria. Still others saw in it a rupture between the Count Tisza, Baron von Burian and the Magyars on the one hand, and von Koerber and the Austrian element on the other. They took it as an additional sign of the growing Hungarian ascendancy. Toward the end of December it was announced that Count Clam Martinitz had been invited to form a ministry. He was described as an aristocrat of ancient Czech family, friendly to the Czechs and ill-disposed to Germany, as opposed to Hungarian supremacy, and as favoring the creation of a triple monarchy of which Austria, Hungary, and Poland should be the constituent parts. Two German ministers, however, were included in the cabinet. The new ministry announced its determination to convoke parliament and to prepare for closer economic union with Hungary. It also announced measures of succor for soldiers' families and gave assurance to the people of abundant supplies. Late in December, 1916, it was reported that Krobatin was to be replaced by Field Marshal von Schleyer.

**THE DEATH OF THE EMPEROR.** The aged Emperor Francis Joseph (q.v.) died on November 21st at nine o'clock in the evening at Schönbrunn. His death was unexpected, for his health

had seemed normal and until the day before he had been able to attend to his duties. He was succeeded by his grand-nephew, the Archduke Charles Francis Joseph (q.v.) who took the title of Charles I.

**THE CORONATION IN HUNGARY.** The coronation of the Emperor at Budapest on December 30th as King Charles of Hungary, an exclusively Hungarian ceremonial, was remarkable in the history of the kingdom for its magnificence. Crowds had gathered from all parts of the country. Along the route of the procession windows were said to have been rented for prices as high as 5000 crowns, and in one instance for 21,000. The royal diploma was presented to the King by a deputation of both Houses, December 28th, and on the following day the King, having signed it, sent it to the Parliament. He then took the oath. At the ceremony the King wore the regalia of a field marshal and was surrounded by the captains of his bodyguard. The members of both Houses, all wearing the national costume, met in a single assembly. One of the first acts of the new King was the appointment of two new guardians for the crown. He voluntarily announced his intention of passing half the year at Budapest and half at Vienna. Owing to the dissatisfaction with the late Emperor's long absences from his Hungarian capital there had been talk of making this even division of time compulsory.

**THE HUNGARIAN PARLIAMENT.** In June occurred a sharp debate on the war in which the government was criticized by members of the Opposition for the military blunder which had sacrificed the Bukovina to the Russians and later in the month several of the leading deputies voted against the provisional budget, showing thus their disapproval of the government's failure to conclude peace, now that the defensive purposes of war had been attained. In July there was further trouble between the government and the Opposition, and Count Tisza, Premier, finally declared the government's willingness to receive the advice of its critics. Later, however, the group headed by Count Michael Karolyi, whose aims were more radically democratic than the bulk of the Independent party, withdrew from the latter and with some disaffected members of other groups, formed a new Independent party which began a vigorous campaign against the ministry, resulting in stormy scenes in the Diet in the session of September 5th and in several following sessions. Count Bela Sereny, member of the government party, resigned his office as Secretary of Agriculture on September 13th. The ministry having received from the Emperor a decree proroguing the Diet, threatened to issue it if the Opposition went to extremes. The latter demanded an investigation at the hands of the Austrian and Hungarian Delegations of the conduct of the government and of the administration of the army in regard to Rumania. They blamed the ministry for not having averted Rumania's entry into the war, for the Rumanian invasion of Transylvania, and for the scarcity of food. But upon the Premier's refusal to accept this demand, the Diet on September 22nd rejected the Opposition motion which had been brought for this purpose. The demands of Count Karolyi were reported on October 7th to be as follows: The dismissal of Count Tisza, the creation of an independent Hungarian army and economic in-

dependence, an independent tariff and bank, and universal suffrage for Hungary. At the end of the year there were reports of the growing insecurity of the Tisza ministry. There were conferences between the leaders and the Emperor, and there was some talk of Count Zichy as his successor.

**SOCIAL AND ECONOMIC CONDITIONS.** Not much trust could be placed in the fragmentary reports as to internal conditions of the Empire, for so far as they went into detail they were derived exclusively from sources controlled by the Entente Powers. Yet from the increasing frequency of the reports as to food scarcity, it seemed probable that the situation was becoming worse. A Socialist journal, the *Arbeiter-Zeitung*, after publishing statistics to show that conditions had become much more serious during the year, pointed out that vegetables were extremely scarce, meat was sold at an exorbitant price, and eggs were not to be had at all. Among the reasons given were the prohibition of imports in certain provinces and the course of the peasants in reserving for their own families very large supplies. There was also a failure in the milk supply owing to scarcity of forage and the decrease in the number of cows. In September a department for the regulation of the food supply was decided upon by the government and its organization was announced early in the following month. Certain journals commented on the measures taken by the food supply controller as extreme and arbitrary. He was reported to have issued an ordinance requiring each department to supply a certain quantity of grain at a certain date and in default of the required amount, as ordering the prefect to diminish the rations either to the population in general or to children alone. Reports of travelers in December referred to serious shortage of food both at Budapest and at Vienna. In Hungary toward the close of the year there were reports of great difficulty in preserving order. In certain places where the police force to a large extent had been enrolled in the army the local administrations had to avail themselves of the voluntary services of civilians. Criminality was reported to be on the increase and the number of juvenile offenders was said to be especially large. Certain highways were so unsafe that travelers did not venture on them unless armed. The Austrian journals reported with congratulations the final capture of a band of brigands which had terrorized several of the departments on the right bank of the Danube. To do this it had been necessary to call out several battalions of regular troops. See PRICES.

**MISCELLANEOUS.** In the summer charges of high treason and espionage were brought against Dr. Kramersch, a leader of the Young Czech party, Dr. Rozenhaim, member of the Diet, and two other members of the Hungarian Czech party. They were accused of a plot for the purpose of uniting Bohemia with Russia. Another treason case was reported in August. The accused were four deputies of whom the principal was Professor Masanyk. The charge against the latter was that of high treason, and against the others of being accessory. Professor Masanyk succeeded in making his escape but the others were convicted on August 21st and sentenced to terms of imprisonment ranging from one year to five years. In July the Finance Minister, Vileozky, said that the war had cost

on an average 450,000,000 crowns a month and was then costing 600,000,000 crowns a month. Subscriptions to the fourth loan, amounting to 1,200,000,000, were received. Great loss of life and damage was caused on September 19th by the bursting of a dam near Gablonz, Bohemia. The dam, which was completed in 1915, had a capacity of 400,000 cubic meters and was connected with a basin which had a capacity of 7,000,000. The flood spread over seven villages in the glassware district, causing 250 deaths and destroying many buildings. See **MILITARY PROGRESS; NAVAL PROGRESS; WAR OF THE NATIONS.**

**AUSTRO-GERMAN RELIEF FUNDS.** See **RELIEF FOR WAR VICTIMS**, section so entitled.

**AUTHORS' LEAGUE OF AMERICA.** The League is a business association of authors and others identified with the production of books, and of persons in artistic work. It is intended to result in mutual service, benefit, and protection. Writers, whether of novels, poems, stories, essays, or educational books, also writers of dramas and photo-plays, painters, illustrators, composers, sculptors, and photographers may become regular members. Among the associate members are publishers, theatrical managers, literary and dramatic agents. Through its collection, registration, employment, business, and copyright bureaus, the League is able to serve its members in various ways, especially by advice in the matter of contract, aid in collecting accounts due, and assistance in securing copyrights. The League is not simply a business association, but has frequent meetings of a social character.

The officers for 1916-17 are: President, Winston Churchill; vice-president, Theodore Roosevelt; secretary and treasurer, Eric Schuler; counsel, B. H. Stern.

**AUTOMOBILES.** The automobile industry in the United States in 1916 attained extraordinary dimensions and the demand for pleasure and commercial vehicles continued unabated. The increased price of gasoline (see **PETROLEUM**) introduced problems in operation and design and was reflected by changes and improvements in the carburetors so that it was possible to use with advantage the lower grade fuels that petroleum refiners were putting on the market. In 1916 it was realized that the gasoline automobile mechanism, so far as its essential principles were concerned, had reached a point where the great majority of machines embodied the same fundamental principles, and at the same time perfection of processes of manufacture and of the details of the machines themselves figured more than the evolution of new designs. Comfort for the passenger and ease of handling were perhaps two leading considerations. Indeed it was said for American designers and manufacturers that whatever the type or cost of the car, whether it was \$500 or \$5000, engine or chassis failure from poor design was practically unknown.

At the end of the year there was a tendency to increase the wheel base to give roomier bodies with wider and deeper seats. Combination summer-winter bodies were in wide vogue, especially with a non-folding permanent top supported by four posts at the front and rear of the car. In touring cars there was a tendency to use but one door on each side and separate the front seats, making them in the form of individual chairs with a passageway between. This arrangement was also adopted with favor for what formerly were two- or three-passenger roadsters. A ten-

dency of 1916 was to reduce the height of the body by placing the seats lower and thus reduce the centre of gravity even at the necessity of providing a longer wheel base. This made an easier riding car. The design of the bodies for touring cars approximated the stream line form as far as possible, and both over the power plant from radiator to windshield and along the sides of the body itself unbroken lines were the rule.

In regard to engines in 1916 there were no marked development or predominance for any single type. More new cars were equipped with 6-cylinder engines than in the previous year and for the best cars this type was a competitor of the 8- and 12-cylinder engines in popular favor. The preference was perhaps for small bore, high speed 6-cylinder engines with an average rating of about 35 horse power.

The great problem in engine design in 1916, not altogether solved, was to find some means of utilizing the less volatile petroleum products, such as kerosene. To use in motor cars kerosene and even lower grade oils in connection with standard motors involved a proper device to proportion the feeding of air and fuel as is done for gasoline by the carburetor, and also some means of heating and vaporizing fuel that was not volatile enough to vaporize itself. In most of the experimental work the appliances under test usually consisted of two parts: one for starting, and the other for running. The first operation of course presented the chief difficulty and attempts were made to solve it either by a separate supply of gasoline or by heat from an oil burner. The heat for vaporization in running would be supplied from the exhaust. With such lower grade fuel it was thought that the combustion space in the cylinder would have to be increased either by raising the heads or by decreasing the length of the connecting rods.

**STATISTICS OF PRODUCTION.** In 1916 according to statistics of the National Automobile Chamber of Commerce, the total American production of all classes of cars was 1,617,708, of which 1,525,578 were passenger automobiles and 92,130 trucks or commercial vehicles. This was the first year in which the American production had passed the million mark. The total value of this output, based on the retail price, was \$1,088,028,273, represented by \$921,378,000 in passenger cars and \$166,650,273 in trucks.

In 1915 the total output of cars was 892,618, valued at \$691,778,950; the gain in production over the preceding year was, therefore, 80 per cent, and this increase was twice as much as the average annual gain since the foundation of the industry. In 1915 there were sold 842,249 passenger cars, valued at \$565,856,450. The output of motor trucks in 1915 was 50,369, valued at \$125,922,500.

The average retail price of passenger cars in 1916 was \$605, as compared with \$672 in 1915. In the first 10 months of 1916 67,618 cars and trucks were exported, as compared with 53,380 in 1915. An estimate for the 12 months of 1916 was 78,200 cars exported.

The estimate of motor vehicles in use in the United States on Dec. 31, 1916, was 3,500,000 and there was frequent discussion as to when the saturation point would be reached for the country. In New York State alone, in 1916, 446,205 licenses were issued, of which number 313,583 were owners, representing 279,930 pleasure cars and 34,653 commercial cars, while 2494 were

dealers and 25,812 motor cyclists. In New York State 104,414 chauffeurs were licensed.

**CENSUS REPORT.** The statistics of the 1914 census for manufactures, issued by the Bureau of the Census and announced in 1916, show the exact extent of the growth of the automobile industry from 1909 to 1914. These were the latest official figures, but they had little value in connection with the status of the industry in 1916.

In 1914 there were 300 establishments engaged primarily in the manufacture of motor vehicles. They employed 79,307 persons, had an invested capital of \$312,876,000, paid \$84,901,000 in salaries and wages during the year, and produced vehicles to the value of \$503,230,000.

In addition, there were 33 establishments engaged in other lines of manufacturing which produced automobiles to the value of \$6,636,920.

Adding the value of bodies and parts produced by 971 companies making this their principal business and 434 other establishments producing them as a side line, brings the total value of automobile products for 1914 to \$649,982,990 — an increase of 153.9 per cent over the value of production of \$254,447,346 in 1909.

**MOTOR TRUCKS.** Naturally there was a heavy demand for motor trucks from the belligerent nations as well as in the United States, but there was little change in design in 1916, and improvements were in the direction of much needed standardization and more economical production. The military operations in the southwestern United States demonstrated the necessity of motor transport in modern warfare and in one case a record of 800 miles across roadless ground was made in 13 days by a motor truck. Motor batteries and motor tractors were extensively used in all military operations, and in Europe the so-called "tanks" or caterpillar tractors lent a new aspect to the war. See **MILITARY PROGRESS.**

The rapid and extensive general use of motor trucks involved many serious questions as regards the construction and maintenance of highway of all kinds, from the dirt roads of the rural districts to city pavements. The chief damage was done by the heavy trucks and trailers of contractors. With a rubber tire which can carry about 750 pounds per inch width the limit was reached and the motor vehicles themselves were not so injurious, but the trailers without rubber tires or springs were responsible for most of the damage. In New York, outside of the State law which had proved quite inadequate, there was little or no adequate regulation of motor trucks and a change of motor truck fees based "upon the time and extent of the vehicles' use of the public highways, and the relative wear and tear of the highways resulting from their use" was under consideration by a commission appointed by the State Legislature.

In New Jersey certain restrictions on motor truck traffic were suggested to protect the State's highways from unreasonable use. The tentative schedule prepared as a forerunner of legislation sought to restrict size, weight, and speed. In other States the heavy cost of upkeep for the highways was bringing the matter also to a focus and one of the immediate tendencies was general legislation in this respect. See **ROADS AND PAVEMENTS.**

During 1916 steel automobile tires were being used in Germany on account of the scarcity of rubber, and were formed of fine steel threads woven together and fixed over an inner band of

rubber which remained intact even after the cover was worn off. The latter had to be replaced after 3500 miles. These steel tires were said to be a makeshift, and not only retarded speed but made rough riding.

**A NEW STEAM CAR.** The most striking novelty of the year was a steam car designed and built by Abner Doble of Detroit. Some of the earliest mechanical pleasure vehicles used in the United States were steam cars with flash boilers, but even in improved form they were unable to hold their own with gasoline engined cars. The advantages of steam, especially as regards power and flexibility, are as evident as its disadvantages, and with the simpler engine and ease of control it was necessary to consider the problem of eliminating the more serious difficulties, such as loss of water by evaporation and time consumed in raising steam. These two problems have been met by the condensation of all the steam used in a radiator similar to that of a gasoline car, so that 1500 miles can be run on a single filling, and using a carburetor and spark plug to produce a fuel mixture which will give an intense heat sufficient to raise steam in one and a half minutes from cold water. Lubricating oil is introduced into the water, so that it acts not only to lubricate the cylinders continuously and automatically, but prevents the formation of scale in the boiler. The engine proper is a simple una-flow double action, two-cylinder locomotive type steam engine with a bore of 5 inches and a stroke of 4 inches. The fuel, which is kerosene, is first mixed in a carburetor and then ignited by an electric spark in the combustion chamber, the air being forced by a blower through the carburetor. The boiler is of the water-tube type, formed of a number of sections each consisting of two horizontal headers connected by 16 vertical tubes, both tubes and headers being of cold drawn seamless steel tubing autogenously welded together. A mileage of 15 miles per gallon of kerosene was claimed for the new cars, and a run of 1000 miles on a single supply of water, while one gallon of lubricating oil would suffice for from 8000 to 12,000 miles. The test machine ran for three years and was found to develop power, flexibility, and reliability in addition to a simplicity of design which served for ready maintenance. The car was put out to sell as a medium price car with due regard for the economies of using a cheaper fuel which was burnt, not exploded.

**RACING EVENTS.** The year 1916 was notable for the speed attained in the automobile racing events. Of the 37 races held, 27 were finished in time which averaged more than 100 miles an hour. The average time for the entire 37 was 87.31 miles per hour, an increase over the preceding year of a little more than 12 miles an hour. If the road races are eliminated the average time was 92.48 miles per hour, the fastest in the history of the sport.

The individual racing honors of the year were won by Dario Resta, the Italian-English driver in his Peugeot car. Resta was victor in 6 of the 11 races in which he took part, including the Chicago Derby, the Indianapolis Sweepstakes, the Omaha Sweepstakes, and the Vanderbilt Cup. His prize winnings totaled \$51,550, to which must be added the Bosch Trophy, emblematic of the championship.

Johnny Aitken ranked second and proved the real speed king of the year. Aitken broke all

records by winning the Harkness Gold Trophy at the Sheepshead Bay Speedway on October 28th in the average time of 105.95 miles per hour for 100 miles. He also won the Astor Cup over the same course, his prize money for 1916 amounting to \$43,756. Eddie Rickenbacher captured third honors, his prize winnings being \$24,300. In the road races, which were probably held for the last time, Eddie O'Connell reigned supreme.

**AVIATION.** See AERONAUTICS; MILITARY PROGRESS.

**BABCOCK, STEPHEN.** An American educator of the blind, died May 19, 1916, in Yonkers, N. Y. He was born at Potter Hill, R. I., in 1832. At 19, having himself become blind, he entered the New York School for the Blind, with which, after graduating, he was connected for 50 years, as instructor, principal, and professor. He retired in 1904. At one time Grover Cleveland, later President of the United States, acted as secretary to Professor Babcock. The raised maps, used in teaching geography to the blind, were invented by him. He was connected with various organizations, being president of the Seventh Day Baptist General Conferences in 1905 and 1906 and treasurer of the American Association of Institutes for the Blind.

**BACCELLI, GUIDO.** An Italian physician, educator, and statesman, died Jan. 10, 1916. He studied medicine at the University of Rome, in which city he was born in 1832, and at his Alma Mater was successively professor of medical jurisprudence, pathological anatomy, and clinical medicine, which last chair he had held since 1863. Baccelli also served as director of the medical clinic in Rome. He was four times Minister of Public Instruction, and did much to reorganize the Italian educational system. From 1901 to 1903 he was Minister of Agriculture. Since 1875 he had sat in parliament as one of the deputies for Rome. One of his most important works is *Patologia del cuore e dell' aorta*.

**BACH FESTIVAL.** See MUSIC, *Festivals*.

**BACON, EDWIN MUNROE.** An American journalist and author, died Feb. 24, 1916, in Boston. He was born in Providence, R. I., in 1844, and entered newspaper work at 19, as a reporter on the *Boston Advertiser*. After experience in other cities, including Chicago and New York, Mr. Bacon returned to Boston, where he was editor in chief of the *Globe* (1873-78), the *Advertiser* (1883-86), and the *Post* (1886-91). In 1891 he retired to devote himself to literary work. Besides contributing to the *Springfield Republican* and the *New York Evening Post*, he published: *Boston* (1903); *The Connecticut River* (1906); *Rambles Around Old Boston* (1914); *Old Seaport Towns of New England* (1915); and he wrote the article on Boston in the *NEW INTERNATIONAL ENCYCLOPEDIA*.

**BACTERIA.** See CANCER.

**BAEKELAND, LEO HENDRIK.** See CHEMISTRY, INDUSTRIAL, *Medals*.

**BAGDAD RAILWAY.** See TURKEY, *Railways*.

**BAHAMAS.** The most northerly of the British West Indian colonies; a chain of about 20 inhabited islands and numerous islets and rocks. Total area, 4403½ square miles; population (1911), 55,944 (of whom 13,554 in the island of New Providence). The population is mostly negro. Nassau, or New Providence, is the capital. Sponges are the principal export (£110,740 in 1910; £148,319 in 1913). The

other products for export include preserved fruits (£8208 in 1913, £7535 in 1914), pineapples, oranges, and grapefruit. Area planted to sisal in 1914, over 20,000 acres; export, 5,605,143 pounds, valued at £46,685. In the following table revenue and expenditure are for fiscal years:

	1910	1911	1913	1914
Imports . . . .	2329,014	2358,111	2403,529	2367,524
Exports * . . .	188,286	276,115	263,954	223,491
Revenue . . . .	84,886	97,574	100,753	76,911
Expenditure . .	85,315	88,077	96,496	102,208
Shipping † . .	1,722,340	1,247,844	1,747,779	1,250,762

\* Of colonial produce. † Tonnage entered and cleared.

Customs revenue 1914-15, £61,597. Public debt (Mar. 31, 1915), £38,246. W. L. Allardyce was appointed Governor in 1914.

**BAKELITE.** See CHEMISTRY, INDUSTRIAL, *Medals*.

**BAKER, BERNARD N.** See SHIPPING BOARD, UNITED STATES.

**BAKER, NEWTON DIEHL.** An American lawyer and public official, whose appointment as Secretary of War to succeed Lindley M. Garrison was confirmed Mar. 9, 1916. Earlier in President Wilson's administration he had twice been offered the post of Secretary of the Interior. Mr. Garrison resigned because he favored a more vigorous policy of military preparedness. Mr. Baker, on the other hand, had been known as a pacifist. He had held office in Cleveland continuously for 14 years, during 10 years of that time as city solicitor and then for two terms as mayor. After the death of Mayor Tom Johnson, Mr. Baker took up the fight for various reforms, including three-cent fares in Cleveland, and carried it to success, and he gained note as a public speaker and political leader. In the Democratic National Convention of 1912, he vigorously championed Wilson's candidacy. He had first known Mr. Wilson as a teacher at Johns Hopkins when he himself was a student. For several years Mr. Baker served as private secretary to Postmaster General Wilson during Cleveland's administration, and afterward he took up the practice of law in Cleveland. At the time he entered the Cabinet, he was the youngest member of that body, being 44 years old.

**BALFOUR, ARTHUR JAMES.** A British statesman, Secretary of State for Foreign Affairs in Lloyd George's cabinet, formed in December, 1916. He succeeded Viscount (Sir Edward) Grey. See GREAT BRITAIN, *History*.

**BALKAN STATES.** See ALBANIA; BULGARIA; GREECE; MONTENEGRO; RUMANIA; SERBIA; and TURKEY; also EPIRUS; MACEDONIA; WAR OF THE NATIONS.

**BALLET, GILBERT.** A French neurologist, died Mar. 16, 1916, in Paris. Born at Ambazac in 1853 and educated at the Lycée of Limoges, he studied medicine under Charcot. His principal professional service was rendered as professor in the faculty of the Hôtel Dieu. He received many honors, having been a president of the Congress of French Neurologists and Alienists, founder of the Psychiatric Society, and officer in other organizations. He was also a Chevalier of the Legion of Honor. One of his important works was translated into English by P. C. Smith as *Neurasthenia* (1908).

**BALLET RUSSE.** See MUSIC, *Ballet*; RUSSIAN BALLET.

**BALLOT.** See **ELECTORAL REFORM.**

**BAMBERGER, SIMON.** Elected Democratic Governor of Utah, Nov. 7, 1916.

**BANDBOX THEATRE.** See **DRAMA.**

**BANK CLEARINGS.** See **FINANCIAL REVIEW.**

**BANKS AND BANKING.** Like its predecessor the year 1916 brought a marvelous development in the banking strength of the United States. The strain upon credit which developed after the beginning of the European war in 1914 had entirely passed by the early days of 1915; and during that year not only did American banks experience great prosperity, but under the stimulation of the Federal Reserve System there was an increased confidence and coordination in the banking business. These developments continued unabated throughout 1916. In November a list of 67 largest commercial banks of the world prepared by *The Financier* included 21 American banks, of which 14 were in New York City. In an additional list of nine government or semi-official government banks was included the United States Federal Reserve Bank as fourth largest, it being exceeded in volume of deposits by the Bank of Russia, Imperial Bank of Germany, and the Bank of England; while the only other bank comparable to it was the Bank of France. The most important developments of the year included the perfection of the Federal Reserve System and the changes in the note issues of principal foreign central banks. Material of interest in this connection will be found under **AGRICULTURAL CREDIT**, where the Federal Farm Loan banking system is described; **FINANCIAL REVIEW**; **NATIONAL BANKS**; **STATE BANKS**; and **SAVINGS BANKS**. For bank buildings, see **ARCHITECTURE**.

**FEDERAL RESERVE SYSTEM.** The second year of the Federal Reserve System, completed Nov. 16, 1916, thoroughly established it as the most important development in American banking history in several decades. Not only did it increase in strength and service to other banks, but it perfected its system of check clearances and began the establishment of foreign branches.

*Annual Report.* The Second Annual Report of the Federal Reserve Board issued February 25th included a report of the chairman of the Board of Directors of each of the 12 reserve banks and that of the Federal Reserve Board itself. It thus comprised a very comprehensive review of the country's banking conditions. It pointed out the abundance of money during 1915 with consequent low interest rates and a wide reserve of lending power throughout our banking system. These conditions, however, kept earnings of banks in general, including the reserve institutions, at a lower rate than usual. With reference to an important aspect of the business of member banks the Reserve Board held that it had no direct responsibility regarding foreign loans since it was given control only as to the commercial character of loans and not as to their destination. The report of February 25th criticized those State banks which took advantage of laws reducing their reserve requirements in order to place them on an equality with national banks, but who nevertheless refused to join the system.

The reports of the district chairmen showed that the several reserve banks had worked smoothly in cooperation with member banks.

Those at Richmond, Atlanta, and Dallas had apparently been of the greatest value to their communities, aiding members, reducing interest rates, and improving borrowing conditions for the public. It was brought out that none of the district banks had engaged in foreign operations, and that the clearings and collection system was still experimental. Nearly 75 per cent of the business done by the Federal Reserve banks in 1915 was due to open market operations, including municipal warrants, government bonds, and bankers' acceptances. Only a small percentage of the total business consisted of rediscounts for member banks, and nearly all of this was done for small country banks; thus transactions not exceeding \$5000 each constituted more than half of the total rediscount business. Another striking characteristic of the operations was that only about \$15,000,000 of reserve bank notes protected by commercial paper were outstanding at the close of the year; in other words, only a fraction of the business of these banks was done through the issue of currency, most of it being done by means of book credits or the actual payment of money on hand.

*Check Clearance and Collection System.* By section 16 of the Federal Reserve Act the Reserve Board was given authority to require each reserve bank to perform the function of check clearance for its members. Member banks, however, could not be required to avail themselves of this service. In 1915 a system of intra-district clearing was inaugurated. The plan was to have each reserve bank serve as a clearing house for its members; but experience showed that this was not workable because banks were reluctant to enter a system through which only a portion of their clearing could be balanced. Hence, on May 1st, the board issued a circular setting forth a national plan of inter-district clearings. The date of beginning operations was set for June 15th but later postponed to July 15th. Under this plan each Federal reserve bank will receive at par checks drawn on all member banks of whatever district. Checks on non-member banks will also be received at par when they can be collected by reserve banks without charge. Each reserve bank will receive from others all checks drawn on banks of its district, and will forward the same to the latter. The order established the rule that uncollected funds in a reserve bank cannot be counted as reserve either by the reserve bank or any member bank. The cost of the new system will be assessed upon member banks in proportion to business. While local banks are not compelled to utilize this service, the merits of the system are expected to lead to its universal adoption. The plan would also bring reserve banks into more intimate touch with local banking business.

*Foreign Agencies.* On December 25th the board announced that the Federal Reserve Bank of the Second (New York) District was authorized to appoint the Bank of England as its agent and correspondent in Great Britain. The authority granted provides for the appointment of agencies, and the opening of accounts with them for the purpose of buying, selling, and collecting bills of exchange. It was expected not only that similar authority would be given to other reserve banks, but also that the Bank of France would soon be brought into a similar relation. Indeed it was believed that this was merely the beginning of a general policy of establishing cor-

respondents throughout the world including not only other European institutions but banks in Japan, China, and Australia. So important had become the United States as a centre of world commerce during 1916 that dollar exchange or exchange on New York was utilized in the foreign trade of every nation. Consequently the creation of foreign correspondents of the Federal reserve system had become almost a necessity in facilitating international exchange. This system was expected also to increase American trade and to heighten the prestige of the United States in world commerce.

**Conditions.** A summary of the combined condition of 12 Federal reserve banks on Dec. 22, 1916, showed total gold reserves of \$449,917,000. This included gold held by the banks, \$269,627,000, and settlement funds balance, \$178,811,000. Other resources amounted to \$295,000,000, including bills discounted and bought of \$156,930,000, and other bonds and notes of \$84,460,000. The principal items of liabilities were: reserve deposits, \$648,787,000; government deposits, \$29,472,000; capital paid in, \$55,765,000; and Federal reserve notes, \$15,754,000. Of the loans and discounts slightly less than one-sixth matured in 10 days; nearly one-third in 30 days; nearly another one-third in 60 days, and most of the remainder in 90 days; only 0.6 per cent matured in more than 90 days. Not included in the above were Federal reserve notes in circulation amounting to \$275,046,000; these were secured by 40 per cent gold reserve. The gold reserve constituted 69.8 per cent of total liabilities.

**British Treasury Bills.** Somewhat of a sensation was occasioned late in November by a statement issued by the Reserve Board cautioning American banks not to invest too freely in a proposed issue of British Exchequer or Treasury Short-time Bills. These were promises to pay certain sums in dollars at New York at the end of 30, 60, or 90 days, 4 months, or 6 months. They were to bear, according to length of time,  $4\frac{1}{2}$  to 5 per cent interest. While in ordinary times such bills might constitute a desirable short-term investment for banks, nevertheless the board thought that under the circumstances there was much probability that the borrower would be under the necessity of extending the time of payment. Consequently the liquid character of these loans was somewhat doubtful. While the board did not wish to make any statement regarding the credit of any foreign nation, and while it recognized the advantages of such loans in steadying foreign exchange, it nevertheless thought that the absorption of these bills should be left to the general investment market. Incidentally the board expressed its opinion that continued importations of gold would not prove a source of financial danger; and with a view to increasing the control of gold movements, it suggested that the final transfer of reserves from members to reserve banks be advanced from Nov. 16, 1917, to February or March, 1917. A few days later J. P. Morgan and Company announced that the bills in question had been withdrawn from sale in deference to the board's statement.

**EARNINGS.** Statements of earnings showed that the aggregate earnings of 1915 were \$2,130,000; aggregate expenses, \$1,490,000; leaving a net income of \$640,000. For the nine months ending Sept. 30, 1916, aggregate earnings were \$3,242,000, and net earnings, \$1,528,000, or 3.7

per cent on total stock. The law required that, before any dividends be declared, all organization and current expenses be paid. The banks at Richmond (5 per cent) and at Dallas (3 per cent) were the first to declare dividends; then, late in 1916, dividends of 6 per cent were declared from earnings of the first nine months following organization by banks at Boston, Philadelphia, Cleveland, and Minneapolis, while that at New York declared 6 per cent from earnings from Nov. 2, 1914, to Mar. 31, 1915.

**PHILIPPINE NATIONAL BANK.** Early in February the Philippine Legislature enacted a law creating a national bank, with \$10,000,000 capital. The government will own a majority of the stock, 60 per cent of which was immediately payable, and the remainder in annual installments. The main purpose of the bank is to conduct financial operations previously carried on by the government itself. It is authorized to make long-term loans on real estate, and to conduct a general commercial banking and foreign exchange business. It may also issue notes based on gold and may establish branches in the provinces and in the United States. It is expected to further the development of American trade and to increase American financial control in the islands. Previously most of the banking accommodation for Philippine business had been extended by British banks and their branches. Mr. H. P. Willis, Secretary of the Federal Reserve Board, was made president and went to the Philippines on six months' leave of absence to organize the bank.

**FOREIGN BANKS.** The effect of the war on the condition of central banks abroad has been shown primarily in changes in the gold reserve and in the note circulation. These banks have been uniformly under enormous pressure to expand their circulation and consequently have been under the necessity of increasing their reserve. On Dec. 28, 1916, the Bank of England held bullion to the amount of £54,505,000, reserve £32,080,000, and notes reserve £31,577,000; its circulation was £39,696,000; public deposits, £52,151,000; other deposits, £122,403,000; current securities held, £57,188,000; and other securities, £106,459,000. The only substantial changes in these figures from Dec. 30, 1915, was an increase of nearly £11,000,000 in other deposits; and of nearly £15,000,000 in current securities.

On the same date the Bank of France held gold amounting to 5,074,913,000 francs; its circulation amounted to 16,688,798,000 francs; deposits, 2,068,210,000 francs; bills discounted, 2,042,131,000 francs; treasury deposits, 82,567,000 francs; and treasury advances, 1,307,386,000 francs. The only substantial change in these figures was an increase of 3,389,000,000 francs in note circulation and an increase of 224,000,000 francs in deposits.

The Imperial Bank of Germany on Nov. 30, 1916, held gold to the amount of \$1,967,425,000; its note circulation was \$1,783,912,000; and its current accounts, \$890,762,000. In comparison with one year previous there was an increase of \$30,244,000 in gold; an increase of \$823,186,000 in loans and discounts; an increase of \$324,554,000 in note circulation; and an increase of \$514,500,000 in current accounts.

The Bank of Russia held on Dec. 6, 1916, gold, silver, and other cash to the amount of \$1,812,115,000, or almost exactly twice the amount held one year previous. Its loans and discounts to-

taled \$3,372,734,000, an increase of \$1,165,000,000 during the year. Its note circulation was \$4,040,382,000, an increase of \$1,501,000,000 over Dec. 6, 1915. Its total deposits were \$1,124,213,000, an increase of \$485,113,000 for the year.

British banking strength never revealed greater reserve power than in successfully meeting the enormous demands of the war. By 1916 not only had the gigantic problems of handling billions of dollars of foreign exchange been worked out, but the banks had become important factors in floating government loans and extending credit to the government on Treasury short-time bills. In addition the expansion of facilities for handling foreign trade continued. The Anglo-South American Bank on August 30th opened a branch at Barcelona. The British-Italian Corporation, with \$5,000,000 capital, was formed by English and Italian banks to develop mutual trade. Plans for the British Trade Bank with \$50,000,000 were completed. The London money market during the year favored the employment by neutral bankers of much larger balances there in commercial bills than ever before, this being particularly true of American and Scandinavian bankers. It should be noted also that beginning on February 5th there were at various times consignments of bills drawn by Russian banks on English banks for the purpose of checking the decline of the ruble.

Canadian banks experienced a year of unprecedented prosperity. Their combined statement, Oct. 31, 1916, showed total assets of \$1,816,000,000, including cash reserve, \$485,000,000; liquid reserve, \$360,000,000; and loans, \$913,000,000. Liabilities included deposits of \$1,519,000,000; and circulation, \$145,000,000. Since June, 1914, deposits had increased about \$400,000,000, while commercial loans had decreased about \$150,000,000. Among the credits extended by Canadian banks was \$120,000,000 to Great Britain for the purchase of war supplies, while arrangements were nearly completed for the granting of \$45,000,000 more.

**BANTU.** See ANTHROPOLOGY.

**BAPTISTS.** According to official statements there were in the United States in 1916, 6,107,686 members of this denomination, as compared with 5,932,364 in 1915. The total number in the world in 1916 was 7,200,324, as compared with 7,003,737 in 1915. There were in the United States in 1916, 1986 Baptist associations, 51,248 churches, and 36,926 ordained ministers. The Baptists in the United States are divided into two main branches and several smaller ones. The two main branches are known as the regular Baptists, and include the Northern and Southern Baptists. The Northern Baptists had, in 1915, 1,566,356 communicants, 12,188 churches, and 12,678 ministers. The Southern Baptists had, in 1915, 4,541,330 communicants (these figures include colored Baptists in the South, of whom there are about 2,000,000), 39,060 churches, and 27,248 ministers. The larger of the smaller subdivisions are the Primitive Baptists, with about 100,000 communicants; the Free Baptists (see below); the Free Will Baptists, with about 60,000 communicants; and the General Baptists, with about 34,000 communicants. There are in addition several smaller divisions of the colored Baptists. The general work of the larger denominations is under the supervision of the Northern Baptist Convention and the Southern Baptist Convention. The meeting of the Northern Bap-

tist Convention was at Minneapolis, Minn., in May. The meeting of the Southern Baptist Convention was at Asheville, N. C., in May. The missionary work of the Northern Baptists is conducted by the American Baptist Foreign Mission Society, the American Baptist Home Mission Society, and the American Baptist Publication Society. The Southern Baptists have their own general agencies. Their foreign mission work is carried on through the Foreign Mission Board at Richmond, Va., and the home mission work through the Home Mission Board at Atlanta, Ga. The Sunday School and publication work is done through the Sunday School Board, Nashville, Tenn. For foreign missions in 1916 the Baptists of the United States contributed \$1,211,901, as compared with \$1,231,664 in 1915; for home missions, \$924,645 in 1916, as compared with \$965,698 in 1915; and for State missions in 1916 there were contributed \$993,180, as compared with \$1,059,914 in 1915. The Baptists maintain 14 theological seminaries and have under their control 101 colleges and universities. There were, in 1916, 43,597 Sunday schools, as compared with 42,769 in 1915; 335,020 officers and teachers in 1916, as compared with 325,475 in 1915; and 3,535,038 Sunday school pupils in 1916, as compared with 3,288,902 in 1915. See BAPTISTS, FREE.

**BAPTISTS, FREE.** The union between this denomination and the regular Baptist denomination is for practical purposes completed. The union of State organizations has been almost entirely accomplished in most of the States. In some cases the designation United Baptist is made. The union between the denominations was inaugurated in October, 1911, by the transfer on the part of the Free Baptists of their denominational and missionary activities to the three national mission organizations of the Northern Baptists: the American Baptist Foreign Mission Society, the American Baptist Home Mission Society, and the American Baptist Publication Society. No full statistics of the present membership of the denomination are available.

**BAR ASSOCIATION, AMERICAN.** The Association held its annual meeting in 1916 in Chicago, August 30th-September 1st. The retiring president, Elihu Root, made an address on "Public Service by the Bar." Addresses were also delivered by Lindley M. Garrison, former Secretary of War, on "Democracy and Law"; by William E. Borah, United States Senator from Idaho, on "The Lawyer and the Public"; and by Dr. Frank J. Goodnow, of Johns Hopkins University, on "Administrative Discretion and Private Rights." After an animated contest, Senator George Sutherland of Utah was elected president of the association, over Walter G. Smith. George Whitelock was reelected secretary, and Frederick E. Wadhams treasurer. In 1916 there were about 10,500 members.

**BARBADOS.** A British colony; the most easterly of the Caribbean Islands. Its area is 166 square miles, and its population (1911), 171,892 (estimated, Dec. 31, 1914, 176,397). The withdrawal of many laborers from the colony to the Canal Zone, together with emigration to Pará (Brazil) and the United States, accounts for the decrease in population since 1891, when it was 182,306. Bridgetown is the capital, with 16,648 inhabitants in 1911. The area under sugar-cane, the island's most important product, is estimated at 64,000 acres. There were in op-

eration 320 sugar works in 1914, producing 33,605 hogsheads of sugar and 101,985 puncheons of molasses. The export of cotton to Great Britain in 1914 was 220,981 pounds, valued at £13,473. In the following table, imports, exports, and shipping are for the calendar years named; revenue and expenditure for the fiscal years:

	1910-11	1911-12	1912-13	1914-15
	£	£	£	£
Imports . . . .	1,345,194	1,465,431	1,853,059	1,300,073
Exports . . . .	1,088,830	1,085,569	856,618	915,009
Revenue . . . .	218,297	234,126	214,865	228,091
Expenditure . .	211,949	230,339	222,177	236,795
Shipping * . .	3,395,085	3,346,982	3,771,598	3,528,140

\* Tonnage entered and cleared.

Customs revenue (1914-15), £111,237. Public debt (Mar. 31, 1915), £447,900 (sinking fund, £192,263). Acting Governor in 1916, W. L. C. Phillips.

**BARKAL.** See ARCHÆOLOGY.

**BARKER, ALBERT SMITH.** An American naval officer, died Jan. 30, 1916, in Washington, D. C. He was born in 1843 at Hanson, Mass., entered the Naval Academy in 1859, and two years later began service in the Civil War. On the *Mississippi*, and after its destruction in the attack on Port Hudson, on the *Monongahela*, he participated in the activities of the West Gulf Blockading Squadron, including the bombardment of Forts Jackson and St. Philip and the capture of New Orleans. Later he served on the *Lancaster* and the *Pochatan*. In 1874, while connected with the torpedo station at Newport, he was the first in the United States to fire dynamite in shells. While in command of the *Enterprise*, after 1882, he ran a line of deep-sea soundings around the world. Admiral Barker, then captain, commanded the cruiser *Newark* in 1898, being present at the bombardment of Manzanillo; then for some months he was in command of the *Oregon* and of a special service squadron to the Pacific. In 1899 he was promoted rear admiral. Between that year and 1903 he was commandant at the navy yards at Norfolk and Brooklyn, and thereafter till his retirement in 1905 served as commander in chief of the North Atlantic Fleet.

**BARLEY.** The production of barley in the northern hemisphere in 1916, as estimated by the International Institute of Agriculture, Rome, was 1,515,200,000 bushels, or 95.2 per cent of the production in 1915 and 102 per cent of the five years' average. This estimate was based to the extent of 64.2 per cent on actual estimates by different countries, and of 35.8 per cent on the average production for the five years 1909-13, regarded as the yield in 1916 for a number of countries, both belligerent and neutral, for which no other data were available. Several countries, comprising Serbia, Turkey in Europe and Asia, Mexico, China, and British India, producing as roughly estimated about 275,000,000 bushels annually, have either no statistical data at all or none for several years past, and are not included in the above estimate. For the southern hemisphere, producing according to estimates, 15,184,000 bushels in the crop year 1915-16, data for 1916-17 are not yet available.

The world's annual total consumption, including about 155,000,000 bushels required for seed, is estimated at about 1,615,000,000 bushels. With the stocks on hand from last year's crop

amounting to about 245,000,000 bushels, the production of the year more than meets the requirements.

The United States, according to estimates published by the Department of Agriculture, produced 180,927,000 bushels in 1916, as against 228,851,000 bushels in 1915, the areas devoted to the crop being 7,674,000 and 7,148,000 acres respectively. The average production for the five years 1910-14 was 186,208,000 bushels, and the average area, 7,593,000 acres. The average yield in 1916, 15.3 bushels per acre, was 2 bushels less than in 1915 and 1 bushel under the 5-year average. The mean farm value on Dec. 1, 1916, was 88.2 cents per bushel, the highest since 1868, and on this basis the total value of the crop was \$159,534,000, the highest on record. In 1915 the average farm value per bushel on December 1st was only 51.6 cents and the total value, \$118,172,000, as compared with 59.6 cents and \$110,840,000, the average values for the five years, 1910-14.

The results of feeding experiments conducted by the California Experiment Station, in which barley was fed as the sole concentrate, indicated that there was no foundation for the claim that feeding barley has an unfavorable influence on milk secretion and tends to dry up the cows. At the Tennessee Experiment Station better results in beef production were secured from a crop rotation of barley and soy beans than from rotations in which corn or oats were substituted for barley.

**BARNARD COLLEGE** (COLUMBIA UNIVERSITY). A non-sectarian institution for the education of women in New York City. Besides 699 students enrolled primarily at Barnard in the fall of 1916, there were 61 women from other schools of the university taking courses. The faculty numbered 80, but 25 additional instructors came from other departments of the university to give courses. During the year Mr Jacob H. Schiff gave \$500,000 to Barnard for a Students' Hall, to contain gymnasium, swimming pool, lunch-room, reading-rooms, etc. At the end of 1916 this building was in process of erection. The college draws \$60,000 income from its productive funds. It has a reading-room containing 1100 volumes and students have the privileges of the Columbia University (q.v.) library. President, Nicholas Murray Butler; Dean, Virginia Crocheron Gildersleeve.

**BABOTSELAND.** See RHODESIA.

**BARRIE, SIR JAMES MATTHEW.** See DRAMA.

**BARRIENTOS, MARIA.** See MUSIC, *Opera*.

**BASEBALL.** The national game had its most prosperous year in 1916. The attendance in the American League exceeded that of 1915 by more than a million, while in the older organization, the National League, all records for a period of forty years were broken. The minor leagues still suffered from the effects of the conflict between organized ball and the Federal League, but steps were taken at the meetings of the baseball rulers in December to remedy the conditions existing throughout the smaller circuits.

Two heavy clouds, either one of which may bring serious storms, loom on the baseball horizon. They are the \$900,000 suit for damages brought by the Baltimore Federal League club against organized baseball and the peace committee appointed to represent the Federals in 1915, and the threatened strike of the players.

who fear a general reduction in salaries in 1917 as a result of the withdrawal of competition due to the abandonment of the Federal League.

The Baltimore Federal League club contends that it never authorized any committee to arrange peace terms with the older leagues and therefore has recourse to legal action to recover losses sustained as the result of the peace agreement. James Gilmore, Harry F. Sinclair, Phillip Ball, Charles Weeghman, and other officials of the defunct league maintain on the other hand that they had the sanction of the Baltimore club when the baseball hatchet was buried.

The Boston American League team, known to the fans as the Red Sox, for the second year in succession carried off the championship honors. The Brooklyn Dodgers, winners of the National League pennant, were hopelessly outclassed in the series for the title, capturing only one game of the five played. The first two games were played in Boston, the second going 14 innings before the Red Sox triumphed by a score of 2 to 1. The third and fourth games were contested in Brooklyn, the Dodgers scoring their only victory in the first of these, 4 to 3.

The attendance and receipts for the big series were large considering the fact that only five games were played. A total of 143,341 persons witnessed the contests and the amount paid for admissions was \$320,361.50. The players on the winning team received \$3826.25 each and the losers, \$2645.45 each.

The pennant race in the American League was close throughout, the Red Sox finally shaking off the Chicago White Sox and the Detroit Tigers on the last trip the Boston men made through the West. The success of the Red Sox was primarily due to their wonderful pitching staff, consisting of Leonard, Ruth, Shore, and Mays. Credit also must be given to the manager of the team, William Carrigan, who went behind the bat in the crucial games and proved an inspiring and steadying influence.

The surprise of the year in the American League was the dethronement of Tyrus Cobb of the Detroit Tigers as batting king by Tristram Speaker of the Cleveland Indians. "Babe" Ruth of the Red Sox won the pitching laurels in the American League.

The National League flag chase was the most thrilling in years, the contenders being the Brooklyn Dodgers, the Philadelphia club, and the Boston Braves. The outcome was not decided until the closing week of the season. The striking feature of the season in the older league was the record-breaking spurt of the New York Giants, who captured 26 games in succession, thereby excelling the old mark of 21 straight victories set by the Providence team.

The leading batter in the National League was Hal Chase of the Cincinnati Reds, while the pitching honors again went to Alexander of the Philadelphia club.

The final standing in the National League was: Brooklyn won 94, lost 60; Philadelphia won 91, lost 62; Boston won 89, lost 63; New York won 86, lost 66; Chicago won 67, lost 86; Pittsburgh won 65, lost 89; St. Louis won 60, lost 93; Cincinnati won 60, lost 93.

The final standing in the American League was: Boston won 91, lost 63; Chicago won 89, lost 65; Detroit won 87, lost 67; New York won 80, lost 74; St. Louis won 79, lost 75; Cleveland

won 77, lost 77; Washington won 76, lost 77; Philadelphia won 36, lost 117.

The pennant winners in the more important minor leagues were: International, Buffalo; American Association, Louisville; Pacific Coast, Vernon; Western, Omaha; Southern, Nashville.

In college baseball Columbia made the best showing, going through the season with the loss of only one game. Cornell alone defeated the Blue and White nine, the score being 4 to 3. Columbia won 18 games and played a 15-inning tie with Pennsylvania. The pitching of Beck and Smith, who was signed by the New York Giants, was chiefly responsible for Columbia's fine record.

Tufts deserves second place among the college nines, winning 20 games and losing only 2. Harvard comes next with 21 victories and 3 defeats. Syracuse won 19 games and lost 3 and Lehigh won 13 and lost 5.

Harvard triumphed in the triangular series with Yale and Princeton, defeating the Tigers in two straight games and closing her season by two victories in a row over Yale. Princeton defeated Yale in two out of three games.

**BASKETBALL.** The American intercollegiate basketball championship was won by the University of Pennsylvania five with nine victories and two defeats. Princeton finished second with eight victories and three defeats. The standing of the other clubs was: Cornell won 5, lost 5; Yale won 5, lost 5; Dartmouth won 3, lost 7; Columbia won 1, lost 9. Wisconsin captured the Middle Western Conference League title, winning eleven games and losing only one. The standing of the other teams was: Northwestern won 9, lost 3; Illinois won 9, lost 3; Minnesota won 6, lost 6; Indiana won 3, lost 5; Chicago won 4, lost 8; Iowa won 2, lost 4; Ohio won 2, lost 8; Purdue won 2, lost 10.

The University of Utah won the Amateur Athletic Union championship, defeating the Illinois A. C. in the final game by a score of 28 to 27.

**BATTLE CRUISERS.** See **BATTLESHIPS AND OTHER WAR VESSELS.**

**BATTLESHIPS AND OTHER WAR VESSELS.** Their trial in war has had, of course, a tremendously stimulating effect upon the development and improvement of warships. The latest designs and the tendency of new construction in 1916 are briefly described in the following notes:

**BATTLESHIPS.** The size of battleships continued to increase. The new Japanese ships, one of which was under construction, were of 32,000 tons and they were to carry 12 15-inch guns and 20 6-inch. The speed was to be 24 knots.

The German battleships of the T class, completed in 1916, or nearly so, had a displacement of about 30,000 tons, a speed of 23.5 knots, 8 15-inch guns and 16 5.9-inch guns. A new class, two of which, it was reported, had been laid down, were to have a considerably greater displacement, a speed of 25 knots, carry 8 16-inch guns (and smaller pieces), have electric propulsion, and triple bottoms. One of the bottoms was to have 8-inch armor protection against torpedoes.

The new United States battleships were of 32,600 tons, were to have a speed of 21.5 knots, carry 8 16-inch guns (and smaller pieces), and

the heaviest armor of any ships under construction (or designed—so far as known). They were also to have armored under-water protection against torpedoes. Like their immediate predecessors, they were to be electrically driven.

The designs of the new British battleships which had been (or were shortly to be) laid down were kept secret, and the statement was made that they would possess many novel features based on the lessons of the war. One report stated that the speed would be greater than that of the *Queen Elizabeth* class (25 knots) and that they would carry 8 17-inch guns. Another report was that some of them would have comparatively low speed (20 knots), and would be specially protected against torpedoes, by means of armor and an extensive cellular structure along the sides below water. And some change in the design of turrets was expected. All rumors agreed that these vessels would be larger than any ships heretofore built for the British navy.

France was building only one new battleship. Its dimensions were not given out, but the *Moniteur de la Flotte* said it would be driven by Diesel oil engines and have a brake horse power of about 18,000. This means low speed or small size—probably both. The battery was to be carried in 4-gun turrets, and probably would consist of 8 guns of about 15 inches.

The advocates of moderate dimensions for battleships were becoming fewer. The impossibility of adequate protection against heavy guns and torpedoes without large dimensions was fully realized and if high speed was demanded it was realized that the dimensions must be still greater. Electric propulsion was growing in favor, and was not regarded with distrust even by naval authorities who were fitting their ships with geared steam turbines. The question of speed remained undecided. The United States preferred to use the extra displacement to secure better protection and greater gunpower and fuel supply. Great Britain was building both fast and slow ships, but the majority were of the slower and better protected class. The question of armor was attracting increased attention, and further deck protection over turrets, machinery, and magazines was considered necessary in view of the angle of fall of projectiles at long range. Armor against torpedo attack appeared to be fitted in all new ships and special cellular structure of some kind was also becoming a matter of course.

**BATTLE CRUISERS.** The battle cruiser was a type of war vessel that, by 1916, apparently had come to stay. The reasons were many. In the first place it had driven out the large protected cruiser and the so-called armored cruiser, and it was forcing high speed upon light cruisers and destroyers. The sinking of one German and three British vessels of this class in the battle of Jutland Bank cast much doubt on the desirability of war craft which were at once so vulnerable and so expensive. But it was not fair to condemn the type until all the facts were known. The report of the official investigation into the causes of loss might never be published—certainly not until after the war is over. But unofficial explanations were made by those who probably knew the

facts, and these stated that in the cases of the *Queen Mary* and *Indefatigable*, the turrets were pierced and the ammunition in the ready or main magazine was exploded by the deflection of the shell downwards before explosion—or in some similar way. Apparently the shells went through the *tops* of the turrets. As the range was somewhere between 14,000 and 18,000 yards the angle of fall of the projectiles was considerable and the turret top offered little resistance. Had the turret of the best-armored battleship received a similar blow a like result might have followed. The sinking of the *Invincible* was due to the fact that she was exposed to the fire of heavy German battleships and battle cruisers at short range. It was folly to place her so close to so many better protected ships and the *Inflexible* and *Indomitable*, which accompanied her, were lucky not to have shared her fate. Unless the weather was so thick that battle conditions could not be properly gauged we must conclude that Rear Admiral Hood showed more reckless courage than judgment in the course he took up. Vice Admiral Beatty evidently recognized this, for he ordered Hood to retire and prolong his column at the rear end. But before Hood could obey, his flagship was sunk, carrying him and nearly all her officers and crew to the bottom.

If the facts are as stated, the battle cruiser type must not be condemned, but certain features need correction; and vessels of this kind must not be unnecessarily subjected to a volume of fire under which a heavily armed battleship might quickly succumb.

The later battle cruisers, laid down before 1916 or thereabout to be placed under construction, were much larger than their predecessors, had higher speed, thicker armor, and more powerful guns. The details of the new British and German vessels were not given out—it was not known exactly how many were building, but they were said to be markedly better than previous ones. The details of the battle cruisers for the United States navy—of which four were to be commenced during 1917—had not been wholly settled in 1916. The speed was expected to be 35 knots, the battery eight 16-inch guns, the armor protection better than in any battle cruiser of which the details were known, and the size and engine power enormous.

**FAST LIGHT CRUISERS.** These were developments of the fast fleet scouts of 2900 tons brought out by the British navy in 1904, and exemplified by the *Salem*, *Chester*, and *Birmingham* of the United States navy. Such vessels not only could be used as scouts and commerce raiders, but as protectors of destroyer and submarine flotillas and defenders of the fleet against the destroyer and submarine flotillas of the enemy. The increase in speed of battle cruisers brought about a corresponding increase in that of light cruisers, otherwise the battle cruisers could run them down too easily and they could not fulfill their designed rôle. Before the war both Great Britain and Germany had completed light cruisers of about 5000 tons; some of the new vessels of both navies approximated 6000 tons at least, though none of this size were in service in 1916. The four American cruisers then about to be commenced were to have a displacement of 7100 tons, a speed of 35 knots, a battery of eight 6-inch guns, and carry aëroplanes (sea-

planes) and observing balloons. There was some tendency to reaction against the increase in size of craft of this type and a movement towards the development of a new class of 3000 to 3500 tons; but these must either be slower or sacrifice protection (the large vessels carry 4-inch armor belts which are proof against the guns of destroyers) as well as adequate fuel supply (which is absolutely necessary to a successful scout), because there can be very little reduction in the battery which must consist of fairly large guns. In this respect the German light cruisers, which were completed before the war, were deficient; for their guns were no larger than those of many existing destroyers.

**DESTROYERS.** For many years the destroyers of the United States navy had been much larger than those of contemporary boats in other navies. But since 1913 conditions had somewhat changed. The superior seaworthy qualities of the larger boats were recognized in all services and dimensions increased accordingly. The standard in 1916 seemed to be somewhere about 1200 tons, for the British, Japanese, Russian, Argentine, and United States navies are building most of their new boats of about this size. The French and Germans appeared to be satisfied with somewhat smaller craft, though what the Germans were building was not known. Taking a reasonable view of German naval strategy, they probably had some boats of at least 1200 tons under construction. As regards speed, this was increasing. For years it had remained around 30 knots, varying from 29 to 32. But the advancing speed of other vessels had forced up that of destroyers. Most of the new British boats were designed for 35 to 37 knots, but, according to rumor, some were expected to make more than 40 knots. The new United States boats were to have at least 35, a speed which could be given without impairing their very excellent sea-keeping qualities; and the new Japanese boats had approximately the same. The gain in speed was partly attained through the perfection of the geared turbine steam engine, an improvement which added materially to the efficiency of all propelling machinery using steam as the direct propulsive agent.

A comparatively new development in the destroyer line was the flotilla leader. Light cruisers had increased so greatly in size that some sort of flotilla flagship seemed necessary and this solution was apparently being accepted. Flotilla leaders of 1500 to 2000 tons were built or were building for Great Britain, Russia, Italy, Argentina, and Chile.

The importance of the destroyer in war operations of all sorts cannot be over-estimated. No other type of war vessel has so extended a range of duties. It is a protector of heavy ships' cruisers and submarines; it is an assailant of enemy's ships of these types; it serves as a scout, a dispatch vessel, a blockader; it can lay mines and defend mine fields; and it has saved thousands of lives from sinking vessels. See *NAVAL PROGRESS; SUBMARINES.*

**BAYONNE STRIKE.** See *STRIKES.*

**BAUXITE.** See *ALUMINUM AND BAUXITE.*

**BEAN, TABLETON HOFFMAN.** An American ichthyologist, died in Albany, N. Y., Dec. 28, 1916. He was born at Bainbridge, Pa., in 1846. He received the degree of M.D. from Columbian

(now George Washington) University in 1876 and that of M.S. from Indiana University in 1883. Dr. Bean early entered government work, first as an editor of publications, then as an assistant to the United States Fish Commission, and for 15 years (1880-95) was curator of the department of fishes in the United States National Museum. The New York Aquarium, at the Battery, was organized by him, and of it he served as director from 1895 to 1898, also filling the office of acting curator of the American Museum of Natural History in 1897. At the Chicago, Atlanta, Paris (1900), and St. Louis expositions, Dr. Bean was in charge of fishes. In 1906 he was appointed State Fish Culturist of New York State. Dr. Bean gained recognition abroad as well as in the United States. In 1908-09 he was president of the American Fisheries Society. He wrote much in his special department, collaborating with G. B. Goode in publishing *Oceanic Ichthyology* (1896), and contributing to zoological journals.

**BEAR ISLAND.** This desolate island, located between Spitzbergen and Norway, was discovered and named by Barents in 1596, and for three centuries has been considered absolutely worthless. It has suddenly become of economic importance through the discovery of extended areas of coal deposits. While the coal is not of first quality, yet its systematic mining will soon begin under a Norwegian corporation. Harbor facilities and a wireless station are already planned.

**BEATTY, SIR DAVID.** British naval officer, appointed commander-in-chief of the grand fleet in December, 1916, succeeding Sir John Jellicoe. Hero of the battle of Jutland. See *NAVAL PROGRESS, section Naval Operations; WAR OF THE NATIONS.*

**BEAUX-ARTS INSTITUTE OF DESIGN.** An organization incorporated in 1916 to carry on educational work previously conducted by the Society of Beaux-Arts Architects. With the Society it is housed in a building of its own at 126 East Seventh-fifth Street, New York City. The season of 1915-16 was the twenty-third in which a course of instruction had been offered. Ateliers, 112 in number, were maintained in 89 cities—36 States, besides Canada and Panama, being represented. There were 846 registered students who submitted 2457 drawings. Exclusive of prize competition there were 42 other competitions. The following prizes were awarded during the year: Pupin; Warren; Morris Loeb (two competitions); Spiering; Municipal Art Society; and American Group of the Société des Architectes Diplomes par le Gouvernement Français (prize and medal). The object of the Institute and the Society is to perpetuate the principles and associations of the Ecole des Beaux-Arts, Paris.

**BECK, EDWARD ANTHONY.** An English educator, died at Cambridge April 12, 1916. Born in 1848 at Castle Rising, Norfolk, he attended Bishop Stortford Grammar School and Trinity Hall, Cambridge, where he received numerous honors, graduating in 1871. With his college he was identified throughout his life, as tutor, proctor, and, after 1902, as master, and he was known and greatly beloved by all Trinity Hall men. For eight years he served as a member of the Council of the Senate of the University, and from 1904 to 1906 as vice chancellor. His

literary ability, particularly in the form of light verse, was well known to his own circle.

**BEECHAM, SIR THOMAS.** See **MUSIC, England.**

**BEECKMAN, ROBERT LIVINGSTON.** Re-elected Republican Governor of Rhode Island, Nov. 7, 1916. See **RHODE ISLAND.**

**BEER.** See **LIQUORS.**

**BEEF SUGAR.** See **SUGAR.**

**BEGAS, KARL.** A German sculptor, died Feb. 22, 1916. He was born in Berlin in 1845, and belonged to a famous family of sculptors. He studied in the studio of his brother Reinhold in Berlin, and also in Italy. In Berlin he executed important commissions, especially of monumental portrait statues, although he is known also for smaller figure groups. His statue of Knobelsdorff is in the Berlin Museum, and statues of Solon and Aristotle are at the University of Kiel. Other works include: the Franco-Prussian War monument at Cassel, an equestrian statue of William II at Barmen, and a monument to Empress Auguste Victoria at Urville, Elsass.

**BELGIAN CONGO.** See **CONGO, BELGIAN.**

**BELGIAN RELIEF COMMISSION.** See **RELIEF FOR WAR VICTIMS.**

**BELGIUM.** One of the smaller European states, lying between France and the Netherlands and bordering on the North Sea; a constitutional monarchy, hereditary in the male line of the house of Saxe-Coburg-and-Gotha. Capital, Brussels. During the present great European war the government was removed first to Ostend, later to Le Havre, France. The Germans occupied Brussels Aug. 20, 1914; Antwerp, Oct. 9, 1914; Ostend, Oct. 15, 1914. The German government levied a war tax amounting to 480,000,000 francs in the year ending October, 1916; took over administrative powers, seized public utilities, and deported large numbers of the civil population to work in German mines and factories.

**AREA AND POPULATION.** The area and population by provinces, according to the census taken Dec. 31, 1910, and compared with the population as estimated Dec. 31, 1912, with the number of inhabitants (density) per square kilometer in 1910, are as follows:

	Sq. km.	1910	D.	1912
Antwerp	2,882	968,677	348	1,004,909
Brabant	3,283	1,469,677	455	1,522,941
West Flanders	3,284	874,135	272	884,777
East Flanders	3,000	1,120,385	375	1,134,079
Hainaut	3,722	1,232,867	333	1,247,042
Liège	2,895	888,341	308	896,649
Limburg	2,408	275,691	116	284,171
Luxemburg	4,418	231,215	52	232,500
Namur	3,660	362,846	99	364,319
<b>Total Belgium</b>	<b>29,451*</b>	<b>7,423,784†</b>	<b>254</b>	<b>7,571,387</b>

\* 11,371 square miles. † *De jure* population; *de facto* population, 7,416,454.

Belgians in 1910 numbered 7,175,222; French, 80,705; Dutch, 70,950; Germans, 57,010; Luxembourgais, 10,367; Russians, 7491; English, 6974; Austro-Hungarians, 5927; Italians, 4490; other Europeans, 1514; non-Europeans, 3074. Of the total population in 1910, 3,680,790 were males and 3,742,994 were females. The census of 1900 returned 6,693,548 (3,324,834 males and 3,368,714 females); 1880, 5,520,009; 1850, 4,426,205.

The population of Antwerp as calculated

Dec. 31, 1912, was 312,844 (with suburbs, 412,917); Brussels, 175,809 (756,637); Liège, 170,634 (235,584); Ghent, 167,477 (211,519); Schaerbeek,\* 90,231; Ixelles,\* 81,772; Molenbeek-St.-Jean,\* 76,248; St.-Gilles,\* 66,572; Anderlecht,\* 68,315; Malines, 59,735; Bruges, 53,635; Borgerhout, 51,486; Verviers, 45,964; Ostend, 43,002; Louvain, 42,482; Seraing, 41,833; Tournai, 37,349; Courtrai, 36,029; Laeken,\* 37,060; Alost, 35,603; St.-Nicolas, 35,128; Etterbeek,\* 34,557; Namur, 32,453; St.-Josse-ten-Noode,\* 32,474; Berchem, 31,655; Charleroi, 29,462; Uccle, 29,282; Jumet, 28,082; Mons, 27,805; Lierre, 26,162; Forest, 27,346; Roulers, 26,027. The asterisks mark faubourgs of Brussels.

The number of marriages in 1912 was 61,278; births, 171,187; deaths, 112,378; stillbirths, 7789; immigrants, 42,980; emigrants, 35,775. No later returns are available.

**EDUCATION.** Schools are maintained by communal taxation, with provincial and state grants, while many are under ecclesiastical control (largely Roman Catholic). There are numerous private and special schools, besides universities (state) at Ghent and Liège and (non-state) at Louvain and Brussels.

**AGRICULTURE.** The Meuse and its tributary, the Sambre, divide the country into two distinct regions, the western part being for the most part level and fertile, the eastern (the tableland of Ardennes) possessing a poor soil. The type of agriculture practiced is highly intensive. It was calculated that before the German invasion there were under cultivation in the kingdom 2,607,514 hectares (including 721,938 fallow, underbrush, and otherwise irregularly productive), of which 1,818,156 under sown crops and grasses, and 67,419 under orchards, gardens, vineyards, etc. No later figures are available than those given in the preceding **YEAR BOOK.**

The agricultural population has steadily declined from 24.98 per cent in 1864 to 21.77 per cent in 1880, and 18.79 in 1895.

**MINING AND METALS, ETC.** Belgium is essentially a manufacturing country and she is largely dependent on her neighbors for food. The abundance of cheap fuel makes practicable an extensive metallurgical industry, for which ores are imported, the output from the domestic metallic mines having materially decreased since 1880. No later official figures than those given in the preceding **YEAR BOOK** are available at present.

**COMMERCE.** The table below gives (in millions of francs) the trade, general and special, for comparative years:

	1890	1900	1910	1911
Imports, general	3,189.2	3,594.4	6,551.7	6,806.4
Imports, special	1,672.1	2,215.8	4,265.0	4,508.5
Exports, general	2,948.1	3,297.5	5,694.6	5,879.3
Exports, special	1,437.0	1,922.9	3,407.4	3,580.3

In 1912 the imports for consumption were valued at 4,958,000,000 francs; the exports of domestic produce, at 3,951,500,000; transit, 2,437,300,000. In the table below are shown important articles of import, with values for comparative years, in francs:

Imports	1912	1913
Wool	428,629,000	410,190,000
Wheat	401,903,000	393,186,000

Imports	1912	1913
Cotton	211,927,000	210,420,000
Lead	291,495,000	29,067,000
Raw hides	179,818,000	189,156,000
Coal	148,409,000	161,957,000
Corn	189,047,000	110,425,000
Rubber	184,654,000	145,235,000
Flax	108,920,000	100,673,000
Beer	11,422,000	18,078,000
Barley, etc.	91,733,000	78,018,000
Coffee	86,663,000	92,830,000
Seeds	145,656,000	172,725,000
Wood	123,074,000	124,505,000
Jute	17,617,000	14,673,000
Pig iron	58,449,000	43,323,000
Machinery	97,595,000	107,036,000
Oil cake	53,318,000	56,309,000
Copper	47,902,000	42,082,000
Chem. prod.	120,568,000	141,696,000
Petroleum	45,008,000	42,108,000
Dyes	57,200,000	65,289,000
Wine	35,915,000	40,842,000

A table of exports for comparative years follows, values in francs:

Exports	1912	1913
Wool	396,001,000	350,497,000
Flax	140,875,000	132,823,000
Flax yarns	131,018,000	114,402,000
Zinc	120,017,000	93,499,000
Raw hides	119,732,000	112,384,000
Vehicles	119,821,000	94,884,000
Rubber	109,945,000	109,249,000
Iron and steel	262,149,000	251,315,000
Wheat	93,612,000	73,126,000
Coal	92,309,000	90,230,000
Cotton	92,882,000	84,348,000
Vegetable oil	48,512,000	31,208,000
Copper	29,819,000	32,771,000
Machinery	94,250,000	77,112,000
Oil cloth	2,441,000	2,854,000
Window glass	48,224,000	45,741,000
Dyes and colors	62,249,000	68,127,000
Corn	44,071,000	24,380,000
Lead	32,191,000	34,712,000
Horses	37,831,000	40,894,000
Wool yarns	61,868,000	65,092,000
Chemical products	83,285,000	93,601,000
Paper	88,687,000	37,388,000

**RAILWAYS.** At the end of 1912 there were 4719 kilometers of railway in operation, of which 4369 were operated by the state. Local lines, 3855 kilometers. The Belgian railway lines, as a result of the German invasion, came into the possession of the German authorities and were operated by them regularly after November, 1914.

**FINANCE.** The monetary unit is the franc. The table of revenue and expenditure below is in thousands of francs and includes loans (1912 budget):

	1900	1909	1912	1913
Rev. ordinary	494,106	645,107	754,263	757,655
Rev. extraordinary	48,672	150,109	22,254	.....
Total	542,778	795,216	776,517	.....
	1900	1909	1912	1913
Exp. ordinary	479,056	634,450	753,278	755,540
Exp. extraordinary	95,102	151,747	146,518	.....
Total	574,158	786,197	899,796	.....

Details of the 1914 budget were as follows, in thousands of francs: Revenue—property taxes, 30,362; personal taxes, 27,257; trade licenses, 9500; tax on incomes, 18,000; motor cars, 1500; cinemas, 500; mines, 29; customs, 72,031; excise, 94,703; various, 1652; registration, etc., 49,100; succession, 32,100; stamps, 14,500; fines, etc., 3013; rivers, etc., 3690; railways, 362,300; telegraph and telephone, 23,535; post offices, 27,950; steamboats, 2210; domains, etc., 5590; various, 28,179; repayments, 9609;—total, 807,313. Expenditure—

public debt, 217,503; civil list, dotations, 5614; justice, 32,248; foreign affairs, 5127; interior, 7979; sciences and arts, 43,179; industry, 26,873; railways, 246,484; marine, posts, telegraphs, 54,693; war and gendarmerie, 101,096; finance, 26,544; public works and agriculture, 35,139; colonies, 1443; repayments, etc., 2826; total, 806,754.

The debt stood Jan. 1, 1913, at 3,739,133,738 francs—219,959,832 francs share of the Netherlands debt at 2½ per cent and 3,519,174,106 francs loans at 3 per cent. The greater part of the debt was raised for public works, and the interest is more than covered by the revenue from railways alone.

The estimated revenue of the German governor-general for 1916 was 248,649,935 francs, and the expenditure 274,480,435—a deficit of 25,830,500 francs.

**ARMY.** The reorganized Belgian army remained in 1916 occupying its allotted portion of the defenses of the western frontier. This portion differed from the other fronts in that the Belgians had flooded the intervening hostile ground by means of the Yser and the Yser canal so that except for artillery fire they were not often in actual contact with the Germans. By 1916 the Belgian army had been not only reorganized but reequipped and outfitted through the efforts of the Allies and through such munition or other works that were operated either in France or in the small part of Belgian territory still unoccupied. As the condition demanded for the most part artillery positions and defenses these were provided and the Belgian army was reported to have the most formidable artillery strength of any army of its size. All types of heavy guns were supplied by the Allies, while guns abandoned by the Germans when overtaken by the flood were recovered and repaired. The cavalry was being drilled for the most part in France and was becoming much improved and ready for the opportunity that might come later. The infantry was concerned with the water defenses, manning the dykes that form the first line defenses. Much of the Belgian motor equipment and especially the motor batteries used so effectively was transferred to the Allies.

**GOVERNMENT.** In 1830 Belgium separated from Holland, and her neutrality was guaranteed by a conference of the European powers; and by a further treaty, signed in 1839, by Austria, France, Great Britain, Prussia, The Netherlands, and Russia.

The Belgian constitution of 1831 vests the legislative power jointly in the King, the Senate, and the Chamber of Representatives. The reigning King, Albert (born April 8, 1875, son of the late Prince Philip of Saxe-Coburg-and-Gotha and of Flanders), succeeded Leopold II (his uncle), Dec. 17, 1909. He married (Oct. 2, 1900) Elizabeth of Bavaria. Heir-apparent, Prince Leopold, born Nov. 3, 1901.

HISTORY

**GERMAN FINANCIAL CONTROL.** There were conflicting reports during the year as to the German financial administration. It was asserted on the authority of Belgian sources on September 11th, that the German officials had seized funds to the amount of \$150,000,000, which had been deposited in the Belgian Na-

tional Bank, after the suspension of the moratorium, and that the Germans had announced their intention of keeping the money until two years after the end of the war, and of paying 5 per cent interest. This was denied by German authorities, which declared that after negotiations with the Belgian National Bank the German Imperial Bank notes were transferred to the Imperial Bank and credited to the Belgian institutions, the latter having agreed to this arrangement. The Belgians maintained that the German authorities had arrested and deported without trial M. Carlier, manager of the Belgian National Bank. The German authorities denied that the arrest of M. Carlier had anything to do with the financial transactions. On September 17th, the German government gave notice to foreign powers that any loan to Belgium was null and void so long as the country was occupied by the German military.

**FLEMISH MOVEMENT.** There was much discussion of the nationalistic movement of the Flemings during the year, and considerable speculation as to what extent it was fostered by German influence. In the summer the Flemish People's party renewed its activities, and published a platform calling for the division of the country into two states, one Flemish and the other Walloon, which would be united under the Federal government. At a meeting afterwards a constitution was outlined, providing for self-government on the part of each state, and for the Federal control of only the following departments: Foreign policy, currency, customs, finance, railways, posts, telegraphs, telephones, and the army and navy. Flemish was to be the official language of the Flemish part, and French of the Walloon.

**FORCED LABOR AND DEPORTATIONS.** On Aug. 15, 1915, the German Governor-General in Belgium issued a decree ordering forced labor for the unemployed under pain of imprisonment and fine. On May 2nd, another decree was issued, authorizing the German officials to provide work for the unemployed and rendering any unauthorized person who gave them work liable to three years' imprisonment and a fine. This was followed by a third decree on May 13th, authorizing the civil and military officials to take forcible measures for bringing the unemployed to their places of work. All these measures were defended by the Germans on the ground that the unemployed were a menace to public order, and a burden on public charity. These points were denied by the Belgians. The German Governor-General further defended these measures for the reason that widespread unemployment burdens the finances and its prolongation causes the workmen to lose their technical skill. He also said England was to blame, since she had ruthlessly cut off Belgium from war materials, with a view to placing her under British economic domination after the war. Cardinal Mercier, summing up these points in a protest addressed to the civilized world on November 7th, urged that the best way to protect Belgian finances was to put an end to the war levies, which he said had reached the total of 1,000,000,000 francs, and also to the requisitions in kind which had amounted to several thousands of millions of francs. He declared that to these hardships was now added the deportation of Belgian laborers. He alleged that 400,000 work-

men, reduced to unemployment as a result of the invasion, were subjected to forcible separation from their families, herded into cars, and carried to distant places where they were obliged to work under the German authorities, thus releasing German workmen for military service. It was reported in American newspapers that Belgians, who for any reason were not engaged in work, were gathered by the German authorities into workshops, and obliged to sign contracts printed in German, requiring them to work in Germany for eight cents a day, that they were then shipped to various points in the occupied territory, and that no provision was made for the support of their families. In response to Cardinal Mercier's appeal of November 7th in regard to the Belgian deportations the archbishops and bishops at the session of the Catholic Institute at Paris published an address expressing their sympathy and condemning the deportations as a reestablishment of slavery, inhuman, criminal, and violative of all laws, human and divine. Reports received toward the end of the year indicated that in spite of the fact that the deported Belgians were offered better food and better treatment in general if they would do the work assigned to them, a great many of them persisted in refusing in spite of the most severe hardships. Some of these, after having held out under this discipline for many days, were sent back to their homes in a very enfeebled condition and bearing evidences of tuberculous infection. The United States State Department decided to make the matter the subject of an informal diplomatic remonstrance at Berlin. See UNITED STATES, paragraphs on *History*. See also SPAIN, *History*. **BELGIUM, COMMISSION FOR RELIEF IN.** See RELIEF FOR WAR VICTIMS.

**BENEDICT XV, POPE.** See ROMAN CATHOLIC CHURCH; WAR OF THE NATIONS, *The Diplomacy of the War*.

**BENEFACCTIONS.** See GIFTS AND BEQUESTS.

**BENNETT, ARNOLD.** See LITERATURE, ENGLISH AND AMERICAN, *Fiction*.

**BEREA COLLEGE.** A coeducational institution at Berea, Ky., founded in 1845. In its five departments it had 1350 students enrolled in 1916. The faculty numbered 101. During the year two new buildings were erected and \$500,000 was added to the endowment, which totals \$1,500,000. The library possesses 32,000 volumes. President, William Goodell Frost.

**BERGSON, HENRI.** See PHILOSOPHY.

**BERIBERI.** See VITAMINS.

**BERMUDA.** A British colony, composed of about 300 small islands lying some 500 miles east of Cape Hatteras. Area, about 19 square miles; population (1911 census), 18,994 (12,303 colored). Hamilton (the capital) had 2627 inhabitants; St. George's, 1079. Nearly three-fourths of the area is unfit for cultivation. The remainder is utilized for the production of early spring table crops, for export to the United States. There are no railways. Commerce and finance statistics are given below for comparative years:

	1911	1912	1913	1914
Imports . . . . .	£545,540	£637,178	£570,575	£565,611
Expenditure . . . . .	90,100	78,210	87,779	108,661
Exports . . . . .	184,033	116,586	90,695	80,505
Revenue . . . . .	79,248	83,629	80,576	89,575
Shipping * . . . . .	700,869	1,278,666	1,255,866	1,211,002

\* Tonnage entered and cleared.

Customs revenue (1914), £80,504. A governor administers the colony.

**BERNHARDT, SARAH.** See DRAMA.

**BETHMANN-HOLLWEG, THEOBALD VON.** See GERMANY, *History*; WAR OF THE NATIONS.

**BETTONA.** See ARCHÆOLOGY.

**BIBLE SOCIETY, AMERICAN.** The American Bible Society celebrated its centennial in 1916. Besides the commemorative exercises held by synods and conferences and in churches, seminaries, etc., public celebrations were arranged in Washington and some 14 other great centres of the United States, and in the following foreign capitals: Buenos Aires, Tokyo, Peking, Bangkok, and Cairo; also in Honolulu, Yokohama, and Seoul. Among the prominent speakers at these celebrations were President Wilson, Vice-President Marshall, Speaker Champ Clark, Joseph H. Choate, William J. Bryan, a number of bishops of the Methodist Episcopal Church, and noted educators. It was reported that in the 100 years of its existence the Society had issued 71,536,305 Scriptures at home and 46,151,286 abroad, the corresponding figures for 1916 being 2,707,971 and 5,053,406. During the century it has printed the Bible at the New York Bible House in 54 languages; has aided the translation or revision of the Scriptures in more than 80 languages; and through translation or circulation has provided the Scriptures in 150 of the over 500 languages in which they are available. The Society has an endowment that yields about \$85,000 annually, but its annual expenditure is from \$600,000 to \$800,000. The president in 1916 was James Wood of New York, the corresponding secretaries Drs. John Fox and William Ingraham Haven, the recording secretary Dr. Henry Otis Dwight, and the treasurer William Foulke. Dr. Dwight has published a *Centennial History of the American Bible Society*.

**BICKETT, THOMAS W.** Elected Democratic Governor of North Carolina, Nov. 7, 1916.

**BICYCLING.** See CYCLING.

**BIDDLE, JOHN.** An American army officer, appointed superintendent of the United States Military Academy at West Point, May 17, 1916. He took office on July 1st of the same year, succeeding Colonel Clarence P. Townsley. He was born in Detroit in 1859, and upon graduating from West Point in 1881 was appointed to the Engineer Corps, with which he remained identified. By 1892 he had risen to the rank of captain, and by 1911 to that of colonel, gaining a reputation for high ability. During the Spanish-American War, as chief engineer of United States Volunteers, he served in the expedition to Porto Rico and in Cuba, and for two years he was on duty in the Philippines. At various times Colonel Biddle had charge of river and harbor work at Nashville, Tenn., at San Francisco, and at Baltimore, and from 1901 to 1907, while engineer commissioner of the District of Columbia, he did much for the development of Washington. For several years he was attached to the General Staff at the War Department. During the first half of 1915 he was an observer with the Austro-Hungarian army in Austria and Poland, and subsequently he had charge of river and harbor work at Baltimore.

**BILLIARDS AND POOL.** The outstanding feature of the year 1916 in billiards was the remarkable interest shown in the game by amateurs. Francis S. Appleby, a student of Colum-

bia University, won the National Class B 18.2 balk line championship and also distinguished himself in the Class A tournament in which the victor was Edward W. Gardner, the veteran player. Edgar T. Appleby, a brother of Francis, and Julian Rice were two other amateurs to display unusual skill at the game during the year.

William H. Hoppe again reigned supreme at all forms of balk line billiards, easily outclassing his rivals in the various matches played in New York, Chicago, and other cities. In the three-cushion play Alfred De Oro was forced to bow to the superior prowess of George Moore. The championship laurels in pool, or pocket billiards, went to Frank Taberski of Schenectady, N. Y.

**BLAKE, LUCIEN IRA.** An American electrical engineer, died May 4, 1916. He was born at Mansfield, Mass., graduated at Amherst in 1877 (A.M., 1880), and later took his Ph.D. at the University of Berlin (1883). From 1884 to 1887 he served as professor of physics and electrical engineering at Rose Polytechnic Institute; for 19 years held a similar chair at the University of Kansas; and in 1906 became connected with the Submarine Signal Company of Boston, of which he was chief engineer for a year, and thereafter consulting engineer. In 1893-94, also, he held the post of constructing electrical engineer to the United States Lighthouse Board. Mr. Blake invented a telegraph apparatus for use by submarines.

**BLASCO IBANEZ, VICENTE.** See SPANISH LITERATURE, *Novel*.

**BLIMPS.** See AERONAUTICS.

**BLISS, DANIEL.** An American missionary and educator, died in Beirut, Syria, July 18, 1916. He was born at Georgia, Vt., in 1823, graduated from Amherst in 1852, and in 1855 took the degree of A.M. from the same college. In 1855, also, he finished the course at Andover Theological Seminary and was ordained to the Congregational ministry. For six years he labored as a missionary at Mt. Lebanon, Syria, returning to the United States at the end of that period. This was in 1862, during the Civil War, but Dr. Bliss was successful, nevertheless, in raising \$100,000 to found an American Protestant college in Beirut. In England he raised \$20,000. The college was opened in small quarters with 16 pupils, but in 1873 a new building was dedicated, and eventually this became only one of many. In 1902, when he retired, to be succeeded by his son, Howard S. Bliss, the institution had long been known as one of the two most important of the kind in the Near East, the other being Robert College, Constantinople. It then had more than 800 students and some 75 teachers. Amherst College gave Dr. Bliss the degree of D.D. in 1864.

**BLOW, SUSAN ELIZABETH.** An American educator, died in New York City, March 26, 1916. She was known as the "mother of the kindergarten," as developed in the public schools of the United States. Miss Blow was born in St. Louis in 1843. In 1873, after spending some time in Germany where she studied the kindergartens organized after Froebel's ideas, she gained the permission of the board of education of St. Louis to use a room in one of the St. Louis schools for a kindergarten. For a year she carried this on at her own expense. Her success was so great that the next year others were opened, and also, under Miss Blow's direction, a training school for kindergarten teachers. In 1886, because of poor health, she gave up her activities in St. Louis, but at once began to write, her first book being *Symbolic Education* (1894). She lectured in Boston and in many other cities, from 1909 to 1912 she delivered an important course at Teachers College, New York, and for some years before her death she was connected with the graduate department of the New York Kindergarten Association. Besides the book named, she published *Letters to a Mother on the Philosophy of Froebel* (1899), and *Educational Issues in the Kindergarten* (1908).

**BOCHE.** A colloquial term long employed in France to designate a German, but which became very familiar after the outbreak of the war. Several derivations have been suggested. According to one view it is an abbreviation of the word *caboche*, which is a slang term for head.

**BOGGIANI, THOMAS PIUS, CARDINAL.** See ROMAN CATHOLIC CHURCH.

**BOGUE, VIRGIL GAY.** An American civil engineer, died at sea, Oct. 14, 1916, when returning from Mexico. He was born at Norfolk, N. Y., in 1846, and after graduating in 1868 from Rensselaer Polytechnic Institute was for a year assistant engineer of Prospect Park, Brooklyn. During the next eight years he became widely known for his work as assistant engineer of the Oroya Railway and its Cerro de Pasco branch in Peru. The road had to be built across the Andes at a height of 15,645 feet. Mr. Bogue remained in Peru until 1880, when he returned to the United States as engineer of the construction work of the Northern Pacific Railway. The next year he discovered Stampede Pass, and drove a two mile tunnel that became famous. After six years, he went over to the Union Pacific, and was its chief engineer until 1891. Thereafter he was engaged in private practice, as a consulting engineer, with offices in New York. To the department of public works of that city he served as consulting engineer. Mr. Bogue was greatly in demand as an expert in matters of railway routes, economics, etc., especially for the Southern Pacific, the Tehuantepec National Railway of Mexico, the Denver, Western, and Pacific, the Canadian Pacific, and the railways of New Zealand. He was called upon to plan the tidelands and waterfront improvement of Seattle, Wash., and to advise on navigation of the Columbia River. He was a member of numerous engineering societies.

**BOHEMIA.** A crownland and titular kingdom of Austria. See AUSTRIA-HUNGARY.

**BOILERS.** The tendency towards increased size of boiler units that had been manifested in previous years continued in 1916, and where once the average upper limit for large plants had been 6000 to 7000 square feet of heating

surface, it had become 12,000 square feet, while at the Connors Creek plant of the Detroit Edison Company and at Delray practically double this amount of heating surface was employed. Particularly large boilers of the Badenhausen type were being installed at the new plant under construction for the Ford Motor Company at Detroit with 25,000 square feet of heating surface. These boilers were the largest in the United States and naturally were compared with the Siller-Christians boiler at the Reisholz Station of the Rheinisch-Westfälisches Electricitätswerk A. G. near Düsseldorf, Germany, as this was stated to be the largest unit in Europe, having 29,600 square feet of heating surface in the boiler proper. It was able to evaporate from 123,000 to 132,000 pounds of feed water per hour from 86° Fahrenheit into steam at 220 pounds gauge pressure and 600° Fahrenheit temperature. In the United States, however, the limits of capacity apparently were not reached, for one manufacturer was reported as ready to supply boilers with as much as 40,000 square feet of heating surface in the seven-drum design built for 300 pounds pressure, while designs for boilers with 45,000 square feet of heating surface were said to have been prepared by the builders of the new Ford units.

In the design and operation of boilers there was a tendency towards higher pressures and increased efficiency was being secured by the use of recording instruments and especially steam and water meters. The economizer continued to grow in favor and in the larger installations it was often built in as an integral part of the boiler. Improved automatic stokers were being developed, one of which, a forced-draft chain gate stoker, was attracting interest.

A new form of boiler intended for marine use was the Talbot boiler of the contra-flow type with forced circulation and intended for high operating pressures. The water enters near the stack and after being driven through the tubes at high velocity, which favors a high rate of evaporation, leaves the boiler near the furnace in the form of steam. The boiler has no drums and consists of tubes and headers of relatively small diameters so it possesses unusual strength. The feed water and fuel burners are controlled automatically.

The Boiler Code of the American Society of Mechanical Engineers, dealing with boiler construction (see YEAR BOOK for 1915), continued to attract attention and was being advocated by manufacturers, insurance interests, and especially the American Uniform Boiler Law Society. During 1916 this code was adopted by Pennsylvania and California and other States and some important cities were considering the matter favorably. There was a manifest need of boiler rules and the code seemed the best and most useful statement available for legislation. Boiler inspection and engineers' license laws were discussed in a number of States though there was little legislation enacted. A bill introduced in Rhode Island failed of passage, while in many States there were no sessions of the legislatures at which bills could be introduced. In Washington, Wisconsin, Maryland, and Colorado the subject was actively agitated, and in Louisiana a bill was enacted authorizing the appointment by the Governor of a commission of five experts to examine the code and report on whether it should be enacted into law.

Specifications for boiler work for the Panama Canal specified that construction should be in accordance with the code with alternate bids on boilers not so constructed. It was stated that New York might adopt the new code for future work, though modifications might be required in the sections referring to existing installations. The matter was in charge of a committee of the Industrial Commission of the State of New York.

The technical journal *Power*, which tabulates boiler failures in the United States, reported for the year ended June 30, 1916, 333 such accidents with 147 fatalities and injuries to 377. The property damage represented near \$500,000, or about \$1500 per accident. The assigned causes for the failures were as follows: cast-iron headers, 60; ruptured tubes, 39; low water, 36; high pressure, 16; and cast-iron water and steam heaters, 90.

See STEAM ENGINES.

**BOISSEVAIN, INEZ MILHOLLAND.** An American woman suffrage leader and lawyer, died Nov. 25, 1916, at Los Angeles, Cal., where she had been overtaken by illness during a speaking tour made in behalf of the Woman's party. Inez Milholland, as she was known in suffrage circles even after her marriage to Eugene Boissevain, a Dutch electrical engineer, was the daughter of John E. Milholland of New York and was born in 1886. At Vassar College, from which she graduated in 1909, she was prominent in athletics and for her championship of radical social ideas. Part of her time was devoted to court probation work in Poughkeepsie. During a vacation she went to England, joined Mrs. Pankhurst's forces, and was arrested in a demonstration. Admittance to Oxford, Cambridge, and the Harvard Law School having been refused her on account of her sex, she entered the Law School of New York University in 1912. In that year Miss Milholland, besides continuing to work for suffrage, aided the shirt-waist strikers in New York. Her methods were somewhat spectacular, but her enthusiasm and ability as a speaker and organizer made her invaluable to the Woman's party and the Congressional Union, with which she was identified. Her marriage to Mr. Boissevain took place in London, July 15, 1913.

**BOKHARA.** A Russian vassal state in central Asia. Estimated area, 83,000 square miles; estimated population, 1,500,000. Capital, Bokhara, with about 75,000 inhabitants. The town of Bokhara is only a few miles from the line of the Trans-Caspian Railway, which traverses the country; the length of the railway within Bokhara is 186 miles.

**BOLDT, GEORGE CHARLES.** An American hotel proprietor, died Dec. 5, 1916, in New York at the Waldorf-Astoria Hotel, of which he had been head since 1893. He was born in 1851 of German peasant parents on the island of Rügen in the Baltic Sea. He had a good elementary education. At 13 he came to the United States to try his fortunes. His first real opportunity came to him as steward of Parker's restaurant. Afterward, in a similar position at the Clover Club, Philadelphia, he gained the confidence of wealthy men, who were ready to back him when he wanted to start the Bellevue Hotel. This was the first hotel in the country to charge very high rates and give extraordinary service. Success came of the venture. An acquaintance with

William Waldorf Astor led in 1893 to the building of the Waldorf Hotel in New York, which at the time was unsurpassed in elegance. It also was a great success, although first called "Boldt's Folly." Foreign hotel men came to America to inspect the Waldorf plant and learn the Boldt methods. In 1897 ground was broken for the Astoria Hotel, which was joined to the Waldorf. At the time of Mr. Boldt's death a ten-year lease on this property at \$800,000 a year had just been renewed. In Philadelphia he was instrumental in the building of the new Bellevue-Stratford and became its proprietor. He had interests in various banks and corporations and was an enthusiastic supporter of Cornell University, of which he was acting president of the Board of Trustees, and to which he had given \$100,000. Mr. Boldt owned a famous thousand-acre estate on the St. Lawrence River. His fortune was supposed to be about \$25,000,000. Many of the notable men of the country counted themselves his friends.

**BOLIVIA.** An interior republic of South America. The executive and legislative departments of government are at La Paz, the largest city, where also the members of the diplomatic corps are resident; the Supreme Court sits at Sucre, the old capital.

**AREA AND POPULATION.** For both the extent of the country and the number of inhabitants varying estimates are current. A recent official estimate places the area at 1,379,014 square kilometers (532,437 square miles) or, including disputed territory, 1,458,034 square kilometers (562,047 square miles). Another estimate, which is perhaps as nearly satisfactory as any until the Paraguayan boundary is determined, is 514,690 square miles. The often quoted estimate of 708,195 square miles may be regarded as much too large. The 1900 census returned a population of 1,744,568, of whom 50.9 per cent were Indian, 26.7 per cent mestizo, 12.7 per cent white, 0.21 per cent negro, and 9.4 per cent unclassified. A calculation published in 1915 showed a population of 2,492,377; it is not unlikely that the figure used in a publication of the Pan American Union in 1916, namely, 2,267,935, is more nearly correct. The great lofty plateau of Western and Central Bolivia contains the larger part of the population, both rural and urban. Estimated population of the larger towns: La Paz, about 95,000; Cochabamba, about 30,000; Sucre, Oruro, and Potosí, each about 25,000; Santa Cruz, about 22,000; Tarija, about 8000; Trinidad, about 5000.

**EDUCATION.** Primary instruction is free and nominally compulsory, but a large part of the population is illiterate. Pupils in primary schools are reported to number about 60,000. For secondary education there are a few so-called colleges and other institutions. Opportunity for higher or special instruction is afforded by several establishments, as the university and the school of commerce at La Paz, the university and the normal school at Sucre, the school of languages at Potosí, the agricultural and veterinary school at Cochabamba, and the schools of mines at Potosí and Oruro. Roman Catholicism is the established religion; the exercise of other forms of worship is permitted. Civil marriage is obligatory under a law of 1912.

**PRODUCTION AND COMMERCE.** Economic prosperity derives from the large mineral resources of the country. Agriculture is important only

to meet local needs and not as a factor in the foreign trade. Products of the soil include corn, barley, rice, potatoes, beans, etc., as well as coffee, cacao, coca, and quina. More important than any of these is rubber, large quantities of which are gathered in the northern forests. Rubber stands second to tin in its export value, which among South American countries is exceeded only by that of Brazil. The metals produced in commercial quantities, besides tin, include silver, copper, bismuth, gold, antimony, lead, zinc, and tungsten. Among the tin-producing countries of the world, Bolivia ranks second only to the Federated Malay States. Of the world's output in 1915, the Federated Malay States are credited with over 50 per cent and Bolivia with nearly 30 per cent. The commercial centre of the Bolivian tin industry is Oruro; other tin districts are La Paz, Potosí, and Chorolque. The lodes are found at altitudes varying from 11,000 to 16,000 feet.

Imports and exports have been valued as follows, in thousands of bolivianos:

	1910	1911	1912	1913	1914
Imports ...	48,802	58,371	49,509	54,763	39,761
Exports ...	74,567	82,631	90,123	93,722	65,801

The boliviano is worth approximately 39 cents. On this basis, the value of the imports in American money was \$21,357,505 in 1913, and \$15,506,876 in 1914; exports, \$36,551,390 and \$25,662,447. By classes imports and exports have been as follows, in thousands of bolivianos:

	Imports		Exports	
	1913	1914	1913	1914
Live animals .....	2,230	1,913	117	239
Food and drink .....	10,354	9,508	28	75
Raw material .....	4,707	5,198	90,001	59,879
Manufactures .....	34,096	20,017	261	287
Gold and silver, incl. coin.	3,377	3,125	3,314	5,322
<b>Total .....</b>	<b>54,763</b>	<b>89,761</b>	<b>93,722</b>	<b>65,801</b>

The principal imports are cotton and woolen goods, provisions, machinery and hardware, wines and spirits, and apparel. The chief exports, valued in thousands of bolivianos, were as follows in 1913 and 1914 respectively: Tin concentrates, 67,784 and 42,480; rubber, 14,652 and 8280; silver, 2784 and 2531; bismuth, 2093 and 2377; copper concentrates, 2774 and 2369; gold coin, 154 and 2479; coca, 682 and 651; wolframite (tungsten ore), 415 and 428; hides, 360 and 286; lead ore, 353 and 155. The export of tin concentrates amounted to 44,595 metric tons in 1913 and 37,260 in 1914; rubber, 5143 and 4485; copper concentrates, 4029 and 3874; bismuth, 422 and 438; wolframite, 282 and 276. Of the tin concentrates, 35,957 metric tons, valued at 40,991,055 bolivianos, were exported to the United Kingdom, and 1115 tons, valued at 1,274,889 bolivianos, to Germany. Of the copper concentrates, 2124 tons, valued at 1,301,892 bolivianos, were exported to France, and 1613 tons, valued at 984,142 bolivianos, to the United Kingdom.

Imports and exports, in thousands of dollars, by countries:

	Imports		Exports	
	1913	1914	1913	1914
Germany .....	7,886	4,144	8,110	1,489
United Kingdom .....	4,880	8,045	29,548	20,255
Chile .....	2,168	2,140	230	484

	Imports		Exports	
	1913	1914	1913	1914
United States .....	1,577	1,808	218	956
Peru .....	1,180	1,115	13	395
Argentina .....	1,287	1,006	856	345
Belgium .....	881	899	1,237	736
France .....	803	418	1,783	1,036
<b>Total, incl. others....</b>	<b>21,858</b>	<b>15,507</b>	<b>36,551</b>	<b>25,662</b>

COMMUNICATIONS. The length of railway in operation was stated in 1916 to be 1305 kilometers (811 miles), and that under construction 605 kilometers (376 miles). Bolivia has access to the sea by three lines of railway, the terminals being the Chilean ports of Antofagasta and Arica and the Peruvian port of Mollendo. The principal line extends from Antofagasta to the frontier town Ollagué, a distance of 440 kilometers, and thence through Uyuni, Rio Mulatos, Challapata, Poopó, and Machacamarcá to Oruro, the distance in Bolivian territory being 482 kilometers. There is connection at Oruro for Viacha (202 kilometers), which is also on the Guaqui-La Paz line and the line from Arica; the distance from Viacha to Alto de La Paz is 23 kilometers. The remaining distance, 8 kilometers, to La Paz, has been covered by an electric line, but it was expected that steam communication would be established by the end of 1916. The distance from Viacha to Guaqui, on Lake Titicaca, is 65 kilometers; Guaqui has steam connection with Puno, on the Peruvian shore, whence there is rail to Mollendo. The line from Arica to Alto de La Paz is 439 kilometers long, the Bolivian section being 233 kilometers. The total distance from La Paz to Antofagasta is 1155 kilometers, from La Paz to Mollendo 861 kilometers, and from La Paz to Arica 447 kilometers.

The La Paz-Yungel Railway was opened for traffic late in 1916 and is a line approximately 137 miles long. A project discussed during the year was the Potosí-Sucre Railway, an extension of the Rio Mulato branch of the Antofagasta and Bolivia Railway. As no bids were received for the construction by outside contractors the government decided to proceed with the building through its own Department of Public Works.

Telegraphic communication is established with foreign countries and between the principal towns, including all the departmental capitals. In 1912 the length of line was 6133 kilometers; wire, 8951; number of offices, 194. There are several radiotelegraphic stations. Post offices are reported to number 317.

FINANCE. The standard of value is gold. The monetary unit is the boliviano; its par value is 38,932 cents, or 12.5 bolivianos to the pound sterling. For the fiscal year 1915, the budget showed estimated revenue of 25,263,500 bolivianos and estimated expenditure of 24,630,702 bolivianos. The estimated revenue comprised: import duties, 9,975,850 bolivianos; export duties, 4,825,000; taxes, 6,753,000; other receipts, 3,709,650. Estimated departmental disbursements: finance, 9,360,820 bolivianos; war and colonization, 5,714,675; interior and fomento, 3,771,326; public instruction and agriculture, 2,562,468; justice and industry, 1,786,297; foreign affairs and worship, 945,934; Congress, 480,182. The foreign debt, as reported for 1915, amounted to about 36,821,700 bolivianos; internal debt, 16,442,000.

GOVERNMENT. The executive power is vested

in a president, who is elected by direct vote for four years and is ineligible for the next term. Two vice-presidents are elected for the same period. There is a cabinet of six ministers. The legislative power is exercised by a congress of two houses, the Senate and the Chamber of Deputies. Senators (numbering 16) are elected for six years, and deputies (75) for four years, all by direct vote. The suffrage is held by every male citizen over 21 years of age who is able to read and write and has a fixed, independent income. The President in 1916 was Ismael Montes, who succeeded Eliodoro Villazón Aug. 14, 1913. First Vice-President, Juan M. Saracho; second Vice-President, José Carrasco.

**BOLL WEEVIL.** See COTTON.

**BOLTON, SARAH KNOWLES.** An American author, editor, and temperance worker, died Feb. 21, 1916, in Cleveland, Ohio. Born in Farmington, Conn., in 1841, she studied at Hartford Seminary and later spent two years in Europe, studying and investigating industrial conditions. In 1866 she was married to Charles Edward Bolton, who died in 1901. For three years she served as associate editor of the *Congregationalist*, Boston, and her activities in the National Woman's Christian Temperance Union and the American Humane Education Society brought her the post of assistant corresponding secretary in the former and that of vice-president in the latter. Mrs. Bolton published a number of books in a series called "Famous Men and Women" and including *Poor Boys Who Became Famous* (1885); *Famous American Statesmen* (1888); *Famous Types of Womanhood* (1892); *Famous Givers and their Gifts* (1896), and similar titles; also stories and biographical monographs.

**BOOTH, CHARLES.** An English sociologist and statistician, died at Gracedieu Manor, Leicestershire, Nov. 23, 1916. Born in 1840 in Liverpool and educated there, at 22 he became a partner in the family shipping business of Alfred Booth and Company and for many years before his death he was on the board of the Booth Steamship Company. With these interests he was almost entirely identified until 1886, when he undertook the great work that made him famous—the preparation, by painstaking research and an exhaustive collection of data, of a series of books called *Life and Labor of the People in London*, the first volume of which appeared in 1889 and the last of 10 in 1903. This work was of the highest importance, not only for itself, but because it revolutionized the methods of poor relief, and while stimulating interest in social work removed it from the plane of the sensational or sentimental. Mr. Booth divided the inhabitants of the metropolis into eight classes, and determined the character of every street. Graphically he presented his results in a colored map. He wrote also several books on old age pensions. The author served as president of the Royal Statistical Society in 1892-94, became a Privy Councillor, and a fellow of the Royal Society, and received honorary degrees from Oxford, Cambridge, and Liverpool.

**BOOTS AND SHOES.** In this important industry in 1916 the abnormal conditions generated by the great war continued, while at the same time the changes due to fashion had an economic effect far from negligible. In the United States the year was one of general prosper-

ity for the manufacturers and record prices prevailed, yet the high cost and scarcity of materials required intelligent and careful supervision of manufacturing. Naturally there was an abnormal demand for leather in both the foreign and domestic trade, but supplies were forthcoming at high prices so that most boot and shoe factories were being operated to capacity and many were enlarged. There were transportation problems to be faced as well as the difficulties resulting from European embargoes on hides and skins. The domestic freight embargoes also interfered with the receipt of raw materials and the distribution of the finished product. Boots and shoes in the main followed the leather market, but throughout the year there was a general apprehension that prices might soar to unheard of limits. The period of high prices started in March, when an active demand for hides, leather, and shoes brought increased prices and was also accompanied by good business through May. The conditions were a little easier in the summer but usually the advantage was with the seller. In the autumn came a European demand for sole leather typified in a Russian order for 750,000 sides and bends, and this was followed by a brisk domestic demand for shoes and leather which led to rising prices. Upper leather as well as sole leather was in demand, and when the new shoes for women were put out, which called for more leather, conditions were further disturbed and high prices for all kinds of shoes prevailed. Glazed kid was used increasingly and practically every possible material was employed for uppers with great apprehension on the part of manufacturers that some single style might predominate. The extensive use of cloth for uppers saved the price of leather and the yardage turned to this purpose was considerable. With fashion demanding colored shoes there was a shortage of dye stuffs, and this was met in part by using vegetable dyes or even pigment paints which were made up into paste and spread upon the leather. An interesting item of the year was that one manufacturer who had made over 600,000 pairs of shoes for the United States army on the last developed by Surgeon Major Munson of the army, intended to supply to the general public shoes made on similar lasts.

While complete statistics for the American shoe industry were not available at the end of the year the production of Brockton, Mass., may be cited as typical. In 1916 its factories shipped 795,634 cases as compared with 694,919 in 1915.

The imports and exports of boots and shoes into and from the United States for three successive periods may be of interest, the 10 months ended October being taken in each case.

IMPORTS FOR 10 MONTHS ENDED OCT.

	1914	1915	1916
Boots and shoes . . . . .	\$418,258	\$192,064	\$152,806
Total upper leathers . . . . .	3,388,000	2,035,259	2,488,946

EXPORTS

	1914	1915	1916
Boots and Shoes:			
Children's . . . . .	\$1,875,300	\$ 1,590,683	\$ 2,288,054
Men's . . . . .	7,511,279	25,392,896	25,658,333
Women's . . . . .	4,856,857	4,984,195	8,847,641
Slippers . . . . .	280,110	160,797	285,140

The American public generally were disturbed by rumors of extraordinary increases in

prices of footwear towards the end of the year, but such feelings were based upon apprehension rather than any definite market or economic tendencies.

In Great Britain the leather industries were working during the year under great pressure. For government supplies alone England had endeavored to make purchases in every possible corner of the world and still there was scarceness. Even the high legs of women's fashionable boots figured in a question asked in the House of Commons as an extravagant tendency to be curbed. Cloth was being used increasingly and the greatest economies were practiced. In Germany all leather had become scarce and was under government control with the use of hides restricted. In France an interesting development was the consideration that was being given to the leather industries. There had been a general reluctance to adopt modern machinery to the fullest extent, but this was to be remedied, and with France normally a large exporter, it was hoped that there would be increased production with the restoration of peace conditions. See LEATHER.

**BOSELLI, PAOLO.** An Italian statesman, appointed prime minister on June 24, 1916. A member of an old family of Savona, he was born in 1838. As doctor of laws he graduated from the University of Turin in 1860, then devoted some years to literary work, and by 1870 had taken his seat, held continuously thereafter, in the Chamber of Deputies. His interests were remarkably varied, including merchant marine, education, agriculture, and finance. Of the Council for the Mercantile Marine, which he had helped to establish, he became president in 1881; and under Crispi he served as Minister of Public Instruction from 1888 to 1891 and in 1893 as Minister of Agriculture. Later, until 1896, and again in 1899-1900, he was Minister of Finance. His moderate views, as member of the Right Centre, fitted him for the task of forming a coalition ministry. His scholarly work, including service as professor of financial science in the University of Rome, and books on social, economic, and legal subjects, brought him many honors, among them the presidency of the Italian Institute of History, the Turin Royal Polytechnic, and the Turin Royal Academy of Sciences. See ITALY.

**BOSNIA AND THE HERZEGOVINA.** See AUSTRIA-HUNGARY.

**BOSTON NATIONAL OPERA COMPANY.** See MUSIC, *Opera*.

**BOSTON PUBLIC LIBRARY.** See PAINTING AND SCULPTURE.

**BOSTON SUBWAY.** See RAPID TRANSIT.

**BOSTON SYMPHONY ORCHESTRA.** See MUSIC, sections *Orchestras* and *Novelties*.

**BOSTON UNIVERSITY.** A non-sectarian educational institution in Boston, Mass. It was founded in 1869. The total number of students in all departments at the end of 1916 was 3197, and of faculty members 197. During the year \$167,000 was received in benefactions. The University has \$2,457,301 productive funds and \$423,778 income. The library contains 63,000 volumes. President, Lemuel Herbert Murlin.

**BOTANY.** Among the botanists of note who died within the past year were: Dr. T. J. Burrell, who discovered the cause of pear blight, the first bacterial disease of plants to be demonstrated; Dr. H. E. Hasse, the well-known Ameri-

can lichenologist; Paul Sorauer, founder and editor of *Zeitschrift für Pflanzenkrankheiten*; Dr. Edouard Heckel, the tropical botanist; Count Solms Laubach, the eminent palaeobotanist; Dr. Heinrich Rehm, one of the world's authorities on Ascomycetes; and Charles René Zeiller, the French palaeobotanist. New serial publications to appear were: *Genetics*, devoted to research in heredity; *Materialy*, a Russian journal of plant pathology; *The Quarterly Bulletin* of the Florida Plant Board; *Addisonia*, a quarterly publication of the New York Botanical Garden; and a Japanese Journal of Plant Protection, the official publication of the Nippon Plant Protection Society.

Foreign and domestic quarantines are in effect in the United States on account of plant diseases, the introduction of sugar cane, white and other five-leaved pines, currants, potatoes, maize, citrus stock, etc., being prohibited wholly or in part.

Investigators in ecology have published extensively, Harshberger, Shreve, Harper, McBride, Nichols, Turesson among American ecologists having contributed the results of some of their studies. Taxonomic notes and monographs on various groups of plants or contributions to the floras of regions have been numerous during the year. Bartlett described a new guayule; Goldman, three new species of oaks; Griffiths, new species of *Opuntia*. Hallier has written on the flora of Borneo; Naki, on the woody plants of Korea; Pittier, on new species from Central America; Rowlee, on plants of Patagonia; Sudworth, on spruces and firs of the Rocky Mountain region; Trelease, a monograph of *Phoradendron*; Britton, West Indian plants; Merrill, on the flora of the Philippines, Borneo, etc.; Maxon, tropical American ferns; Murrill, on mushrooms, etc. Reichert claims a study of the proteins and carbohydrates of plants reveals generic and specific characters that can be utilized by taxonomists.

**PLANT BREEDING.** Bartlett has described mass mutation in *Oenothera* and de Vries has given an account of the behavior of a Mendelian mutant of the same genus. Laberge reported two new mutants of *Solanum commersonii*. A number of investigators have made studies of the pollen of plants as an indication of their hybrid origin. Holden, from a study of species of *Epilobium*, concludes that the presence of abortive pollen grains is evidence of hybridity in species which are generally considered valid, thus confirming Jeffrey in this regard. The theory has been recently advanced that many of the numerous species of *Cratægus* are natural hybrids. Gates and Goodspeed claim that sterility of pollen may be due to a number of causes, hybridity being only one of them. Jones and Rayner caution against the splitting of species without regard to breeding tests. Evidence of parthenogenesis has been found in *Primulas* in a study of some of their hybrids. Benedict has described a number of discontinuous variations in the Boston fern. The inheritance of certain characters in oats and maize has been described by Pearl and Surface. East has reported a fertile hybrid between *Nicotiana langsdorffii* and *N. alata*. From a study of hybrids between *Fuchsia* and *Tripsacum*, Collins and Kempton have recognized a type of inheritance which they call patrogenesis. Harper has tried unsuccessfully to recombine the endosperm colors in maize

by making a series of crosses. Biffin found certain dominant characters in wheat may be suppressed and their recessives may appear in the  $F_2$  generation. The abnormal occurrence of doubles in cultivated stocks is explained by Edith Saunders as due to unconscious selection by gardeners, the singles usually being weak plants. Daniel has recently described four graft hybrids that, he claims, appeared in his experiments.

**PLANT PHYSIOLOGY, ETC.** Guilliermond has added to our knowledge regarding the occurrence and function of chondriosomes in plants, and Moreau claims that they arise from preëxisting ones but that mitochondria whose function is to secrete do not divide and those which do divide have no part in secretion. Mottier questions whether other bodies within the cell may not also be chondriosomes. The permeability of cells to different ions has been a subject of much investigation. Osterhout has continued his studies on antagonisms and has described the action of certain paired salts. Fittig, Panatelli, Czapek, and others have contributed the results of their investigations on the absorption of salts by plants. Acqua has shown that plants readily take up substances in solution through their leaves or cut ends of branches, the injury in the latter case needing to be only very slight. Gile and Carrero claim that iron is not translocated from one part to another in rice plants grown in cultures deficient in iron. Willstätter has continued his studies on chlorophyll and finds that in photosynthesis, chlorophyll acts in conjunction with an indispensable enzym. Jorgensen and Kidd, experimenting with pure chlorophyll in the presence of carbon dioxide, found pheophytin formed, their independent experiments confirming those of Willstätter. Spoehr considers very doubtful the theory that formaldehyde is the intermediate product of photosynthesis. He favors the idea that formic acid is produced under the circumstances. Raikow advances the theory that half the oxygen of plants is derived from carbon dioxide, the balance from water within the plant.

Livingston has described a method by which a single index is made to represent the moisture and temperature conditions as related to plants. Both porometer and standardized cobalt paper were found by Trelease and Livingston to measure fairly accurately the transpiring power of plants. Briggs and Shantz found plants undergo changes during the day that may modify their transpiration current. Muenscher claims that variations in the amount of transpiration in plants cannot be attributed to the size and number of stomata. The question of ascent of sap continued to be a matter of controversy among botanists. Copeland, from a review of the literature, claims that the evidence favors the theory that living cells are not essential to the movement of water in stems. Renner, Halle, and Ursprung, from independent investigations, give added evidence in favor of the cohesion theory of the rise of sap. Bailey, from a study of the bordered pits of conifers, found that they are permeable to undissolved gases at pressures below those considered necessary for explaining the tension theory of ascent of sap. The varying content, seasonal fluctuation, and variation of sap in different parts of the same plant have been shown by Dixon, Atkins, Shedd, and others.

Continued experiments on the electric stimulation of plants with high tension currents

showed, while there might be accelerated growth in some cases, the results were not of economic application. Koernicke found that Röntgen and other rays act like toxic substances in general, having a stimulating effect in small dosage, an injurious effect when applied in large amounts. Montemartini failed to find any specific action by ultraviolet rays on the reproductive organs of plants. Sutton has shown that radium preparations have no economic value so far as the growth of plants is concerned. Knudson found galactose toxic to peas, although it was utilized by fungi. The injurious action was overcome by adding glucose to the medium. Molliard reports that potatoes produce aërial tubers when grown in close confinement, and Vilikovsky found starch deposited in the stems when it is formed too rapidly to be transferred to the tubers. Hartwell claims that starch is produced by plants whenever growth is retarded.

The electrical response test of Waller has been successfully applied to determine the percentage of vitality in seeds. Leitch has proposed a new cardinal point in the relation of growth to temperature which she calls the maximum rate temperature. It is the temperature at which greatest growth occurs when time is considered as a factor. Lipman finds that there is no definite lime-magnesium ratio for certain groups of plants, as claimed by Loew. Doyle has shown that the petioles of certain plants can function as stems when stems are grafted upon them. Moreau claims that there are certain colorless compounds of mitochondrial origin which must be classed as anthocyanins. Williams and West found the hydrocyanic content of sorghums to be increased by any agency that checks rapid growth. Benedict claims that the senile changes observed by him in *Vitis Vulpina* are due to accumulated catabolic products.

Howard has concluded his studies on the rest period of plants, which he found to be due to the inhibition of enzym activity and to be broken by the activation of the enzymes by stimulating agents. Lakon claims that annual periodicity of woody plants is not inherent but is due to environmental conditions. Molliard has presented additional evidence showing that plants excrete substances through their roots which are toxic to the same kind of plants. Löhnis and Smith have found that the life cycle of bacteria embraces several subcycles, and that all bacteria pass through an amorphous or symplastic phase in which they are filterable but are able to reproduce their type. Studies on the distribution and action of soil fungi and bacteria have been reported by many investigators. Fred found that the turning under of green manure crops is often detrimental to the germination of seeds of subsequent crops, probably through the development of parasitic fungi. E. F. Smith has submitted additional data to prove that crown gall of plants is cancer.

**PLANT DISEASES.** Among so-called physiological diseases, or those whose cause is unknown, serious injury due to smelter fumes has been reported by the Selby Smelter Commission. Chivers found garden plants seriously injured by fumes from tarvia used on roads. A disease of cucumbers, known as mosaic, has become serious in several States. Black heart of potatoes appears to be associated with rather high temperatures in storage. A disease of greenhouse tomatoes in Canada and elsewhere is believed to

be due to some soil condition. Allard has shown that the mosaic disease of tobacco may be transferred to petunias and tomatoes, but that it is not transmitted by seed. Tubeuf claims that ivy injures the supporting plant by the power of constriction only.

Bacterial diseases not previously reported are described by investigators in many countries. Among those recently published upon are: A bacterial disease of western wheat grass, described by O'Gara; a rotting of potatoes in India; a rot of tomatoes in Italy; a disease of cucumbers in Russia, caused by *Bacillus burgeri*; a bacterial rot of cucumbers in Italy; a blight of field and garden peas in Colorado, described by Sackett as due to *Pseudomonas pisi*; a disease of cassava in Brazil; and a disease of soy bean leaves reported in Nebraska by Heald and in Connecticut by Clinton. Rolfs has published an account of his investigations on the angular leaf spot of cotton, which is due to *Bacillus malvacearum*. The fire blight (*Bacillus amylovorus*) has been found to attack leaves, flowers, fruits, twigs, and trunks of apple and pear trees, and to occur also on peach, cherry, and other trees in the northwestern part of this country. The organism is said to retain its vitality for from 10 to 27 days in branches cut from trees. The bacterial wilt of cucumbers has been found to be transmitted almost entirely by beetles. A bacterial disease of barley occurs in Wisconsin and a number of other States.

Arthur has given the results of 15 years' study of cultures of Uredineæ. The stripe rust of cereals, due to *Puccinia glumarum*, has made its appearance on wheat in several western States. A new smut of Johnson grass is reported in South Africa, and a smut on rice is said to occur in Louisiana and Texas.

The white pine blister blight, in addition to occurring in New England and neighboring States, is also reported in Minnesota and Ontario, being found on both the pine and the currant. It is also said to cause considerable injury in white pine plantations in England, Germany, and elsewhere in Europe. The chestnut blight is spreading rapidly and it has been recently found in Ohio. The citrus canker, which is of bacterial origin, is proving very destructive to grapefruit trees in Florida and adjacent States. All kinds of citrus trees are subject to its attacks, and an active campaign is being waged in all the Gulf States for the eradication of the disease. Investigations in Virginia and West Virginia have shown that apple rust may be controlled by the destruction of all cedar trees within a radius of a mile about apple orchards. The cottony rot of lemons in storage is due to *Sclerotinia libertiana*, according to Smith. The related *S. cinerea* is said to cause blossom blight and rotting of prunes in the Pacific States. Sackett has recently described a disease of raspberries as due to *Sphaerella rubi*.

The mildews have been quite destructive to grapes in France where spraying has been neglected on account of the cost of materials. Potatoes are reported as seriously affected in many regions and some new rots due to *Fusariums* have been described. A rotting of onions in storage, due to attacks of *Sclerotinia cepivorum*, is reported in Ohio. Edgerton has found the bean anthracnose fungus unable to withstand summer temperatures in Louisiana. The fungus which causes cotton wilt has been found by

Wolf to attack peanuts and potatoes. A stem rot of watermelons, caused by a *Diplodia*, has been recently described. Information regarding plant diseases in the tropics is being rapidly added to by the investigations of Petch, Johnston, Rutgers, Fawcett, Rorer, and others. Many reports have been published in the European scientific press on diseases of common field, orchard, and garden crops, with suggestions for the conservation of such crops through the proper use of fungicides. In the Philippines, it has been found possible, by pruning and spraying the trees with Bordeaux mixture, to prevent losses on coffee due to *Hemileia vastatrix*.

Johnson, in Hawaii, found spraying pineapple plants with a solution of iron sulphate would control a serious chlorosis of that plant. The efficacy of treating grains and other seeds with fungicides has been demonstrated for the prevention of many serious diseases, and Johnson in Wisconsin found warm solutions of formalin more effective than cold ones for smut and other diseases of barley. Hot water sprayed on plants has also been found to have an important fungicidal value. Lime-sulphur is being extensively used as a summer spray, as it does not scorch fruit so much as does Bordeaux mixture. The adhesiveness of Bordeaux mixture can be increased by the addition of flour paste. Experiments with fungicides in a dry state have given good results for certain leaf diseases of nursery stock. Morse has shown that lead arsenate, in addition to being an important insecticide, has considerable value as a fungicide.

**Bibliography.** Among recent botanical books, the following may be noted: C. J. Chamberlain, *Methods in Plant Histology*, 3d ed. (Chicago, 1915); C. M. Child, *Individuality of Organisms* (Chicago, 1915); E. M. Dunham, *How to Know the Mooses* (Boston, 1916); C. S. Gager, *Fundamentals of Botany* (Philadelphia, 1916); W. Giltner, *Laboratory Manual of Microbiology* (New York, 1916); C. A. Hall, *Plant Life* (London, 1915); E. O. Jordan, *General Bacteriology*, 5th ed. (Philadelphia, 1916); Geo. Massee, *Diseases of Plants and Trees* (London and New York, 1915); H. L. Russell and E. G. Hastings, *Agricultural Bacteriology* (Madison, Wis., 1915); W. C. Stevens, *Plant Anatomy*, 3d ed., revised (Philadelphia, 1916); A. D. Webster, *Tree Wounds and Diseases* (London, 1916); F. E. Weiss et al., *Plants in Health and Disease* (London, 1916).

**BOUCICAULT, MRS. DION.** See ROBERTSON, AGNES.

**BOWDOIN COLLEGE.** A non-sectarian institution for the higher education of men, founded at Brunswick, Maine, in 1794. In the autumn of 1916 there were 488 students and 93 faculty members. The institution has available in productive funds \$2,401,653, from which it draws an income of \$156,182. The Bowdoin library contains 113,000 volumes. President, William DeWitt Hyde.

**BOWLING.** The sixteenth annual tournament of the American Bowling Congress was held at Toledo, Ohio, in March. Frank Shaw of Chicago, Ben Huesman of Cincinnati, Sam Schliman of Toronto, Canada, and R. Raydl of Chicago tied for the individual honors with a score of 685. The winners in the other events were: Two-man, Thomas and Marino, Chicago, 1279; five-man, Commodore Barry's team, Chicago, 2905.

G. Cook of Brooklyn won the individual title in the tenth annual tournament of the National Bowling Association with a score of 747. The other victors were: Two-man, L. Marino and C. Hummel, Brooklyn, 1312; five-man, Quakers' team of Philadelphia, 2953; all events, G. Cook, Brooklyn, 1948. The Seattle A. C. won the telegraph match open to five-man teams of the United States and Canada with a total of 3146. The Detroit A. C. finished second with 2895 and the Illinois A. C. third with 2889.

**BOXING.** Professional boxing had a dull year in 1916. Few bouts of importance were held and no titles changed hands. The champions at the various weights are Jess Willard, heavyweight; Al McCoy, middleweight; Jack Britton, welterweight; Fred Welsh, lightweight; Johnny Kilbane, featherweight; and Johnny Erle, bantamweight.

The bout that attracted the most attention during the year was that between Jess Willard and Frank Moran in Madison Square Garden, New York City. The affair was a disappointment to the followers of the sport, the heavyweight champion merely demonstrating that he could not be disposed of in a ten-round bout. Welsh successfully defended his lightweight title in a battle with Charley White of Chicago and Kilbane emerged victorious in his bout with George Cheney.

The arrival of Les Darcy, the Australian middleweight champion, in the United States in December, revived interest in the sport and it is possible that the year 1917 may see bouts of international flavor contested.

An attempt was made by Tex Rickard and other boxing promoters of the United States to have Georges Carpentier, the French champion, come to New York and engage in at least one bout, the understanding being that part of the proceeds should be turned over to the Red Cross. Carpentier was serving in the French army and in order to carry out this plan the assent of the French military authorities must be obtained. The necessary arrangements may be made in the spring of this year.

Amateur boxing had a big boom in 1916. Early in the year three of the leading amateurs of the United States visited the Scandinavian countries and took part in various tournaments held there. The men who made the trip were: William Spengler of the Union Settlement, New York, T. Maloney of Philadelphia, and John Kirpinaky of Cleveland.

The championships of the Amateur Athletic Union were held at Boston in April. The results of the final bouts were: 108-pound class—Thomas Darcy, Boston, defeated Izzy Wiesel, Providence; 115-pound class—Ben Valger, Educational Alliance, New York, defeated Tony Vatlan, Brighton; 125-pound class—William Morris, East Side House, New York, defeated Dave Brown, Toronto, Canada; 135-pound class—Thomas Murphy, Kansas City, Mo., defeated John Marto, East Boston; 145-pound class—Eugene Brosseau, Montreal, Canada, defeated Mike Stark, 92d St. Y. M. H. A., New York; 158-pound class—Adolph Kaufman, Trinity Club, New York, defeated Joseph Landrien, New Orleans; 175-pound class—Patrick McCarthy, Roxbury, Mass., defeated Charles Shons, Pittsburgh, Pa.; heavyweight class—Carlo Armstrong, Boston, defeated George Hook, Pittsburgh, Pa.

**BOYCOTT.** See LABOR, AMERICAN FEDERATION OF.

**BOY SCOUTS OF AMERICA.** The number of Boy Scouts enrolled throughout the world is estimated at not less than 1,000,000, one-fifth of whom are in the United States. The ideals of the movement are efficient citizenship, service, and character building. "The Boy Scouts of America," the name under which the movement in the United States was incorporated Feb. 8, 1910, has as its honorary president, Woodrow Wilson, and as honorary vice-presidents, William H. Taft and Theodore Roosevelt. The active president is Colin H. Livingstone and the national scoutmaster is Daniel C. Beard. A group of men, brought together as a local council for the promotion of Scout work, receives a charter from the national organization. In many cases this council engages a scout executive to be leader of the scoutmasters. The Scouts are organized in patrols and troops. Eight boys constitute a patrol, one being chosen as the patrol leader. Three patrols make up a troop. The scoutmaster is the adult leader of the troop. Already there are about 700 local councils in as many cities throughout the United States and under the direction of each there are from 5 to 150 scoutmasters in charge of troops. Any boy of any class or creed, over 12 years of age, is eligible to become a Scout. The initial requirement is that he take the Scout oath. By meeting certain requirements, he is in line to become a Tenderfoot, Second-class Scout, and First-class Scout. Scoutcraft includes instruction in first aid, life saving, tracking, signaling, cycling, nature study, seamanship, campcraft, woodcraft, chivalry, and all the handicrafts.

It is a prime purpose of the Boy Scout movement, abroad as well as in the United States, to teach boys that to create is better than to destroy, and that peace, not war, will make a great nation. Splendid first aid and other humanitarian services have been rendered by the Scouts in the present European war.

**BRANDEIS, LOUIS DEMBITZ.** An American lawyer, who, on June 5, 1916, became a member of the United States Supreme Court. He was nominated by President Wilson the preceding January 28th, but the nomination was not confirmed until June 1st. The suggestion of his name was credited to Attorney General Gregory. Mr. Brandeis, who had not been considered as a possible candidate for the seat left vacant by the death of Mr. Justice Joseph Rucker Lamar, had long been known for legal activities connected with the public interest. He was counsel for Mr. Glavis in the Ballinger-Pinchot investigation in 1910, and for shippers in the advanced freight rate investigation before the Interstate Commerce Commission in 1911, and counsel for the people in supporting the constitutionality of Oregon, Illinois, and Ohio laws providing shorter working hours for women. He prevented the Boston subways from falling into private control, and was responsible for the Boston sliding scale gas system. In 1906-13 he opposed the New Haven Railroad's policies as resulting in a monopoly of transportation in New England. In 1910 he stated that efficient methods would save the railroads of the country \$300,000,000 a year, making an increase in freight rates unnece-

sary. Mr. Brandeis made some of his bitterest enemies among railroad men, although in 1913-14, in the rate hearings, his views often favored their case. As a representative, sometimes unpaid, of minority stockholders and of labor in disputes with capital, as a labor arbitrator (notably in the New York garment workers' strike in 1910), and as a leader of the Jews in the Zionist movement, Mr. Brandeis was known throughout the country. When he was nominated for the Supreme Court bench, much opposition developed. A sub-committee of the judiciary committee of the Senate held public hearings, at which 47 witnesses were heard and 1500 pages of testimony were taken. President A. Lawrence Lowell of Harvard and seven former presidents of the American Bar Association protested against the choice, while ex-President Eliot of Harvard and other prominent men approved it. Finally the Senate confirmed the nomination by a vote of 47 to 22; the vote divided closely on party lines, the Democrats upholding the President's choice. Mr. Brandeis was the first Jew to sit on the Supreme Court bench. He was born in 1856 in Louisville, Ky., studied for two years in Germany, and graduated from Harvard Law School in 1877. In practice in Boston from 1879, he was a member of the firm of Warren and Brandeis till 1897, and thereafter head of the firm of Brandeis, Dunbar, and Nutter. Harvard gave him an honorary A.M. in 1891.

**BRATIANO, J. J. C.** See RUMANIA.

**BRAUN, LILY.** A German feminist, Socialist, and writer, died Aug. 9, 1916, at Berlin. Coming of a distinguished family, named von Kretschman, she was born in 1865 at Halberstadt. She was married first to Prof. Georg von Gizycki, and after his death, to Dr. Heinrich Braun of Berlin. By her lectures and writings she became known as a leader in the woman's movement in Germany. She did much to advance social reforms. Because of her socialistic ideas and associations, she was disinherited by a wealthy aunt, the Countess Klottilde von Herman. Besides publishing many brochures and articles, among the last of which was one on women in their relation to the great war ("Die Frauen und der Krieg," in *Zwischen Krieg und Frieden*, 1915), Frau Lily Braun published the following books: *Deutsche Fürstinnen* (1893); *Die Frauenfrage* (1901); *Im Schatten der Titanen; Erinnerungen an Baronin Jenny von Gustedt* (1908, 54th thousand, 1914); the important *Memoiren einer Socialistin* (2 parts, 1909 and 1911); *Die Liebesbriefe der Marquise* (1912); *Mutter Maria*, a tragedy (1913); and *Lebenssucher* (1915), a notable novel.

**BRAUN, LUDWIG.** A German battle painter, died Feb. 20, 1916. He was born in Württemberg, in 1836, and after studying painting in Munich under his brother Reinhold and under Nelser, he went to Paris, where he was a pupil of Horace Vernet. His observations, and sketches made during the Danish War, the Austro-Prussian War, and particularly the Franco-Prussian War, of which latter he was the official German painter, furnished him material for many striking canvases, such as "The Entry of the German Army into Paris." Braun was particularly successful with panoramic paintings, among these being "The Battle of Sedan."

**BRAZIL, UNITED STATES OF.** A federal republic and the largest country of South America. The capital is Rio de Janeiro.

**AREA AND POPULATION.** The area is variously estimated. A planimetric calculation of the Brazilian ministry of agriculture shows 8,497,540 square kilometers (3,280,900 square miles). The population at present is conjectural. The census of 1890 returned a population of 14,333,915, and that of 1900 17,318,556. A 1913 estimate is 24,308,000, but, although the number of inhabitants has undoubtedly increased with some rapidity, it is not unlikely that this figure is too high. The table below shows by states the estimated area and the estimated population (in 1913) in thousands, together with the state capitals and the number of their inhabitants (in 1913), in thousands. It should be noted that various estimates of the urban population are published and that the figures given here can only be regarded as probably the most nearly correct.

	Sq. km.	Pop.	Capitals	Pop.
Alagoas	58,491	800	Maceió	40
Amazonas	1,894,724	500	Manáos	60
Bahia	426,427	2,560	São Salvador	300
Ceará	104,250	1,000	Fortaleza	65
Espirito Santo	44,889	480	Victoria	30
Goyas	747,311	308	Goyas	25
Maranhão	459,884	600	São Luis	50
Matto Grosso	1,378,788	300	Cuyabá	30
Minas Geraes	547,855	4,850	Beilo Horizonte	40
Pará	1,149,512	760	Belém	170
Parahyba	74,781	650	Parahyba	35
Paraná	251,904	570	Curitiba	60
Pernambuco	128,895	1,650	Recife	250
Piauy	301,797	450	Theresina	30
Rio de Janeiro	68,982	1,250	Nichtheroy	60
Rio Grande do Norte	57,485	480	Natal	20
Rio Grande do Sul	236,553	1,750	Porto Alegre	147
Santa Catharina	48,535	510	Florianopolis	25
São Paulo	290,876	3,200	São Paulo	400
Sergipe	39,080	500	Aracajá	32
Federal District	1,118	1,000	.....	...
Acre Territory	191,000	195	Rio Branco	5
Brazil	8,497,540	24,308	Rio de Janeiro	1,000

In the foregoing table the city of Rio de Janeiro and the Federal District are regarded as coextensive although the area of the city proper is smaller than that of the District. Estimated population of the city, Dec. 31, 1915, 961,822. Immigrants to Brazil numbered 82,572 in 1914, as compared with 192,684 in 1913; arrivals at Rio de Janeiro in 1914 were 38,918, and at Santos 47,570. The immigrants of 1914 included 27,923 Portuguese, 18,945 Spaniards, 15,552 Italians, 3675 Japanese, 3456 subjects of Turkey, and 2958 subjects of Russia.

The greater part of the population is illiterate. Elementary education, which is free, secular, and in some states nominally compulsory, has made considerable progress in recent years. Schools of all kinds number about 13,000, with an estimated enrollment of about 750,000. There are a number of secondary, normal, special, and technical schools. Instruction in agriculture is encouraged by all of the state governments. Brazil has no university, but in several of the large cities are faculties of law, medicine, and engineering. The Brazilians are almost wholly Roman Catholic, but Church and State are separate, and the exercise of all religious forms is permitted.

**PRODUCTION.** About four-fifths of the world's coffee is produced in Brazil and over one-half

in the state of São Paulo. Coffee is the crop of first commercial importance. Besides São Paulo the principal coffee-producing states are Rio de Janeiro, Espírito Santo, and Minas Geraes. The average annual production is estimated at about 12,000,000 sacks (one sack = 60 kilograms = 132.377 pounds). Next to coffee in importance is rubber. Most of the product grows in the natural forests of the Amazon region, but rubber cultivation is encouraged by the government. Other valuable crops include sugar cane, rice, cotton, tobacco, maté (hera matté), corn, manioc, bananas and other fruits, Brazil nuts, and cacao. Brazil has become the leading cacao-producing country of the world; cacao is grown especially in the state of Bahia. Sugar cane is produced chiefly in Pernambuco and other parts of the northeast; cotton, largely in the northeast; maté, chiefly in Paraná; tobacco, in Bahia and Rio Grande do Sul. In 1913 there were in Brazil about 7,289,000 horses, 3,208,000 mules and asses, 30,705,000 cattle, 10,653,000 sheep, 10,000,000 goats, and 18,399,000 swine. Since 1914 the frozen-meat industry has increased notably in importance. Mining is not greatly developed although parts of the country are rich in minerals. The greater part of the world's supply of monazite sand is produced in Brazil; other minerals exploited include manganese (the output of which has recently shown a large increase), gold, and gems. Coal (mostly inferior) and petroleum occur in considerable quantity. There are extensive iron deposits in Minas Geraes. The leading manufacture of Brazil is cotton piece goods; other manufactures of some importance are woolen and silk goods, flour, and beer. See COTTON.

COMMERCE. Below is shown the value of imports and exports, in contos (that is, thousands of milreis) gold. The milreis gold is valued at 54.62 cents.

	1905	1910	1913	1914	1915
Imports	265,156	425,529	597,034	815,312	267,452
Exports	896,828	560,814	576,488	413,571	470,847

In thousands of American dollars, the trade is represented by the following figures:

	1911	1912	1913	1914	1915
Imports	257,164	308,244	326,429	172,224	146,082
Exports	325,272	362,795	315,165	225,892	257,177

Classified imports in 1914 and 1915 respectively: live animals, 1,321,654 and 380,832 milreis gold; primary materials and materials used in the arts and sciences, 65,392,521 and 70,528,356; manufactures, 152,816,534 and 95,948,783; alimentary substances, 95,781,603 and 100,594,396. The leading imports include machinery and other iron and steel manufactures, railway materials, cotton fabrics, coal, flour, codfish, wine, arms and ammunition, kerosene, and paper. Exports are divided into three major classifications, as follows (values in contos):

	1913	1914	1915
Animals and animal products	29,613	23,114	37,819
Minerals and mineral products	6,276	7,076	10,431
Vegetable products	540,545	383,881	422,598
Total	576,433	413,571	470,847

The reported coffee export in 1914 and 1915 respectively was 11,271,000 and 17,061,000 sacks (of 60 kilos each). Quantity of the other principal exports in 1914 and 1915 is reported as follows, in metric tons: rubber, 33,531 and 35,165; tobacco, 26,980 and 27,096; sugar, 31,860 and 59,074 (in 1915, 37,981 tons, or about 64 per cent, were produced in Pernambuco); maté, 59,354 and 75,885; cacao, 40,767 and 44,980; cotton, 30,434 and 5228; leather, 31,442 and 38,324; hides, 2487 and 4573. The exportation of hides and frozen meat increased rapidly in 1915 and 1916.

Imports by principal countries, in thousands of dollars:

	1912	1913	1914	1915
United States	48,109	51,290	30,213	46,858
United Kingdom	77,616	79,881	40,958	32,029
Argentina	23,117	24,294	16,570	23,237
Portugal	14,589	14,328	8,785	7,236
France	27,751	31,940	18,486	7,217
Italy	12,096	12,366	7,033	6,443
Newfoundland	2,854	3,825	3,462	3,113
British India	1,998	2,680	1,832	2,722
Norway	8,138	8,432	2,772	2,428
Germany	53,018	57,044	27,767	2,255
Uruguay	7,718	7,047	2,641	2,172
Belgium	16,593	16,679	4,894	251
Austria-Hungary	4,895	4,928	1,746	193

Total including others	308,244	326,429	172,224	146,082
------------------------	---------	---------	---------	---------

Exports by principal countries, in thousands of dollars:

	1912	1913	1914	1915
United States	141,915	102,568	92,253	107,524
United Kingdom	43,066	41,702	32,750	31,096
France	35,515	38,686	18,591	29,285
Sweden	3,118	3,194	5,187	23,187
Netherlands	22,981	23,253	13,076	16,361
Argentina	14,329	14,848	10,680	12,990
Italy	4,096	4,067	6,768	8,073
Norway	680	482	1,517	7,614
Denmark	900	734	1,350	5,939
Uruguay	4,161	5,167	3,905	4,439
Portugal	769	1,589	2,020	2,361
Germany	51,928	44,892	22,510	0
Austria-Hungary	18,258	15,206	4,930	....
Belgium	9,729	8,093	3,613	....

Total, including others	362,795	315,165	225,892	257,177
-------------------------	---------	---------	---------	---------

COMMUNICATIONS. The length of railway in operation Dec. 31, 1915, was 28,282 kilometers (16,331 miles), as compared with 26,062 kilometers (16,194 miles) Dec. 31, 1914. The following is quoted from a monograph issued by the Pan American Union in 1916:

"The railways of Brazil were originally established with the purpose of bringing the products of a contributing interior territory to the nearest seaport and of distributing to this interior the merchandise brought in from abroad. On the Atlantic coast, Recife (Pernambuco) is the focus of one system, Sao Salvador (Bahia) of another, Rio de Janeiro of a third, São Paulo and Santos (the coffee region) of a fourth, and Rio Grande do Sul, in the extreme south, of a fifth system. In recent years the government has felt the great need of connecting these various systems by interior railways running north and south, both to afford interior communication independent of the ocean and to stimulate an internal commerce and settlement. This plan has been successful north and south of Recife, so that to-day it is possible to travel by rail between

the ports of Natal and Maceió; in like manner Rio de Janeiro has been connected with São Paulo, Porto Alegre, and Rio Grande do Sul, and also with the growing port of Victoria, north of the capital. South of São Paulo, through the states of Paraná, Santa Catharina, and Rio Grande do Sul, toward the Uruguayan frontier, connection is established between the lines in these states and those of Uruguay, so that by the close of the year it was possible to travel by rail from Rio de Janeiro to Montevideo, a total length of 1967 miles (3165 kilometers). The Federal capital as well as the larger cities are served by street railways, many of which are electric lines. The many streams in the Republic are capable of furnishing an enormous power for electrical purposes, and it is proposed to electrify certain portions of the railway lines already in existence.

"Brazil has been favored by nature with a most wonderful system of fluvial arteries. It has within its territory not only the largest river basin, both in area and in length, in the world, but has also perhaps more navigable rivers than any other country. The mighty Amazon is navigable almost for its entire length, as are most of its affluents, while in the southern part of Brazil the Paraguay, Uruguay, and Paraná rivers are all navigable."

In the state of São Paulo high freight rates and other conditions had provoked a general discussion of the railway situation for several years, and the President of the state in a message to the Legislature recommended that the principal railways of the state should be leased by the state government and placed under state control. He stated that the tendency of foreign investors was to acquire railways already in operation rather than to construct new roads which would aid in the development of the country. In 1915 only 88 miles of railway were constructed, so that at the beginning of 1916 there was a total of 3893 miles of railway in the state, of which three-fourths, or 2700 miles, were owned by private corporations, 972 miles by the state, and 220 miles by the Federal government.

The President of Brazil granted a concession for the construction and operation of a railway from Cuyabá, the capital of the state of Matto Grosso, through the town of Sant' Anna, on the Paranahyba River, to connect with the Araraquara Railway at a place called Jangada, or at São José do Rio Preto. This total extension was to be about 620 miles in length, and would afford direct railway communication between Cuyabá and the ports of Rio and Santos. The concession provided that plans for the first section, 62 miles, must be submitted to the government before June 30, 1919, and construction work must be begun within one year from the date of approval of these plans by the government. Construction must be carried on at the rate of 31 miles per year. The concession called for a single track of 3.28-ft. gauge.

Federal telegraph lines at the end of 1915 aggregated 36,705 kilometers, with 68,315 kilometers of wire and 725 offices. As reported for the end of 1912, the aggregate length of all telegraph lines in Brazil was 58,257 kilometers, with 117,682 kilometers of wire and 2244 offices. Wireless telegraphy is established and the

number of stations increasing. The system of stations makes communication possible with remote regions of the interior, while the station at Belém is capable of direct communication with the United States. Post offices in 1914 numbered 3587.

**FINANCE.** The monetary unit is the milreis, equivalent to 54.62 cents. The ordinary medium of exchange is the paper milreis; its par value is 32.444 cents, but its actual value fluctuates, being in 1916 about 25 cents. The proposed budget for the fiscal year 1917, as presented to the Congress on June 5, 1916, showed a total estimated expenditure of 97,750,000 milreis gold and 406,388,000 milreis paper, as compared with 84,365,000 milreis gold and 409,850,000 milreis paper of the 1916 budget. For 1915 the estimated expenditure was 70,999,000 milreis gold and 378,862,000 paper. Public debt as reported Dec. 31, 1914: foreign, £106,050,688 and 1,569,760,320 milreis; internal, 717,002,200 milreis; floating, 245,435,538 milreis; paper money in circulation, 822,496,018 milreis.

**NAVY.** The Brazilian navy in 1916 included the following vessels: two battleships (*Minas Geraes*, 1908; *São Paulo*, 1909), with a combined displacement of 38,500 tons and 53,000 indicated horse power; 2 armored coast guards (*Deodoro*, 1898; *Floriano*, 1899), aggregating 6320 tons; 2 monitors (1905), 940 tons; 1 protected cruiser (*Barroso*, 1896), 3450 tons; 2 scout cruisers (*Rio Grande* and *Bahia*, 1909), 6200 tons, 34,000 horse power; 3 torpedo cruisers (1896-98), 3090 tons, 18,000 horse power; 10 torpedo-boat destroyers (1908-10), 6500 tons, 80,000 horse power; and river gunboats, transports, etc.

**GOVERNMENT.** The executive authority is vested in a president elected for four years by direct vote and ineligible for the next term. He is assisted by a cabinet of seven members appointed by and responsible to himself. The legislative power is exercised by a congress of two houses, the Senate and the Chamber of Deputies. Senators, 63 in number (3 for each state and 3 for the Federal District) are elected by direct vote for nine years. The deputies (212) are elected for three years. The franchise is held by male citizens not less than 21 years of age who can read and write, except soldiers actually serving and monastics under vows of obedience. The President in 1916 was Wenceslão Braz Pereira Gomes, who was inaugurated Nov. 15, 1914, in succession to Marshal Hermes da Fonseca; Vice-President, Urbano dos Santos da Costa Araújo.

The Brazilian states have elective governors and legislatures and enjoy a large degree of autonomy.

A revolutionary movement aiming at the overthrow of the government, and the establishment of a parliamentary republic by starting a mutiny among the troops was organized by the deputy Mauricio Lacerda. It was suppressed by the police on April 6th, and a number of arrests were made. The Brazilian Chamber of Deputies on October 17th voted by 103 to 5 the Arbitration Treaty which had been signed by the A B C Powers in May, 1916.

**BRENT, THEODORE.** See SHIPPING BOARD, UNITED STATES.

**BRETHREN, CHURCH OF THE.** A religious denomination known also as the Dunkers or Dunkards. There are three branches: the Conservative, the Progressives, and Old Order. There are also the Seventh Day German Brethren, numbering in 1916 about 300 communicants, 15 churches, and 6 ministers. The Conservative, the largest branch, numbered in 1916 about 97,000 communicants, 965 churches, and 3106 ministers. The Progressives had in 1916 about 24,000 communicants, 210 churches, and 300 ministers. The Old Order had about 3500 communicants, 70 churches, and 216 ministers. The Conservative group maintains 10 schools, one of which is the Bethany Bible School in Chicago, devoted entirely to study in the Bible. There is a publishing house at Elgin, Ill., where a large number of papers and books are issued. Mission work is carried on in Denmark, Sweden, India, and China. The Progressives have a publishing house at Ashland, Ohio.

**BRIDGES.** An obvious effect of the great world war was to confine largely to the neutral countries or those removed from the actual scenes of combat bridge building and other forms of constructive civil engineering. Accordingly one must look to the United States for the most important of the new projects and construction or reconstruction work, not forgetting Canada with its ill-fated Quebec Bridge whose erection was marked by another serious mishap. But in America the war had its effect in the increased cost of materials and the demands for all structural steel that prevented prompt deliveries on the taking of contracts where early shipments were involved. The quotation for structural shapes at Pittsburgh was 1.15 cents in March, 1915; 2.25 in March, 1916; 2.75 in November, 1916; and 3.15 cents in December, 1916. Plates were quoted still higher in proportion on account of the demand in ship and car building. However, there was much work to be finished and considerable new work to be put under way, including important reconstructions.

There was an increased tendency to employ concrete and reinforced concrete, and much track elevation involved important bridge design and construction, but there were few notable structures of this material comparable to the great viaducts on the Delaware, Lackawanna, and Western Railroad. For the new Galveston causeway to replace 5900 feet of paved sand-fill approaches washed out in the hurricane of Aug. 16 and 17, 1915, a board of engineers decided in favor of 60-ft. arch spans at an estimated cost of \$1,376,300. There were to be creosoted pile foundations and an improved system of reinforcement. See *Engineering Record*, Jan. 6, 1917.

Reconstruction work as well as actual new construction figured largely in the bridge work of 1916 in the United States. A notable piece of reconstruction was the bridge of the Pennsylvania Lines across the Ohio River at Louisville, Ky., to replace that built in 1869 and in continuous use from that time. Inasmuch as the United States government required a

clear span of at least 200 feet for the new draw over the Canal, the definite design was a matter of controversy and litigation, though a contract had been placed for a part of the work. The design and construction of the new bridge was to be in charge of S. C. Bland, engineer of bridges for the Pennsylvania Lines. A second bridge across the Ohio that was to be replaced was that of the Cincinnati Southern Railway, at Cincinnati, Ohio, where a structure completed in 1877 was to be removed and a double track superstructure erected on the same piers after designs by Ralph Modjeski. At Keokuk, Iowa, the Mississippi River bridge built in 1869-70 was reconstructed on the old piers, while at Omaha, Neb., the Union Pacific R. R. bridge, 1722 feet long, across the Missouri River was under reconstruction, and on December 22nd the old structure was slid on to false work and a new bridge weighing 5000 tons was slipped onto the old piers. This bridge was built in 1872, but was partially rebuilt in 1887. The reconstruction which involved an expense of about \$1,000,000 was after designs by R. L. Huntley, chief engineer of the Union Pacific R. R. The four 246-ft. river spans were rolled into place simultaneously in less than four hours and there was involved but an hour's delay to traffic.

THE HELL GATE BRIDGE was receiving its finishing touches and the two end towers had reached nearly their full height at the end of the year. The connecting viaducts and tracks were being rushed. It was stated during the year that through trains to the East beyond New Haven would be run across this bridge and through the East River tunnels and use the Pennsylvania Terminal in Manhattan. Furthermore all trains from Boston to Philadelphia and Washington naturally would make use of the new route.

THE HARAHAN BRIDGE across the Mississippi River at Memphis, Tenn., was completed and on July 15, 1916, was placed in service. The bridge, named for J. T. Harahan, consists of four spans of 2201 feet 10½ inches, a simple 345-ft. deck span on the western end and beyond that a steel viaduct 2363 feet long. The erection of the bridge was considerably delayed by unusual flood conditions and considerable of the false work was lost (see YEAR BOOK for 1915, article BRIDGES). Of the total weight of metal in the entire structure, 21,400 tons, 8900 tons are of Mayari steel. The bridge carries double railway track and on either side, supported by brackets, the highway. The bridge was designed by Ralph Modjeski. See *Railway Age Gazette*, Oct. 13, 1916.

METROPOLIS BRIDGE. The 720-ft. channel span of the Metropolis (Ill.) Bridge across the Ohio River on the new Paducah and Illinois R. R. of the Chicago, Burlington, and Quincy R. R. was successfully erected during the year and on December 11th was swung clear into place. This is the longest simple truss span ever built and is double-track, semi-pin connected and is of sub-truss Pratt type with 36-ft. sub panels. The erection work was done by derrick car and crane and the bridge was swung by lowering on hydraulic jacks and steel blocking. The bridge is also notable for the extensive use of silicon steel in the main members of the trusses and for the exceptionally high live load which was assumed in the design. See *Engineering*

*News*, July 29, 1915, June 8, 1916, July 27, 1916.

**SCIOTOVILLE AND OTHER RAILROAD BRIDGES.** There was also progress during the year on the 1500-ft. riveted span of the bridge across the Ohio River at Sciotoville, Ohio, for the Chesapeake and Ohio Northern R. R. This structure, which is continuous over three supports, was to be completed in 1917. It comprises two 775-ft. spans continuous over the middle pier and is not only a virtually new type of structure for America but at the same time the largest of the kind ever attempted. An unusual feature of the work of erection to which attention was called by *Engineering News*, was "the bending of the truss members during erection in such direction and amount as to bring all members into precisely straight condition when the completed bridge is loaded to half its live-load capacity. The object is to eliminate secondary stresses, not only in the chords but also in the web members."

At Kansas City the Chicago, Burlington, and Quincy R. R. was constructing a new bridge across the Missouri River, in which a feature was the use of heat-treated steel for some of the members. The St. Louis Municipal Bridge, which is an important factor in providing additional rail connections to that city, was being supplied with the east approach viaduct, while a notable structure completed during the year was the three-track single-leaf bascule span of the Chicago and Northwestern Railway at Chicago.

Late in the autumn of 1916 a contract for a double deck bridge and viaduct over the Kaw River at Kansas City was let by the Kansas City Terminal. This project involved the use of 25,000 tons of steel and was an important element in the terminal development of that city. The construction of the new bridge across the Thames River at New London, Conn., for the New York, New Haven, and Hartford had not progressed beyond the foundations, a work of great difficulty that was being carried on by open caissons, as the depth was beyond the limits of pneumatic working. The Bessemer and Lake Erie was building a new 2327-ft. viaduct and bridge over the Allegheny River at Black Run involving the use of 10,000 tons of steel.

**PROPOSED SAN FRANCISCO-OAKLAND BRIDGE.** During the year there was renewed discussion of a San Francisco-Oakland Bridge and public hearings were held by a United States Army Board of Engineers on August 15th and 17th, at which three important sets of plans were presented and considered for a report to the War Department. These projects, while not entirely new, were of interest as indicating modern practice in bridge construction. According to the *Engineering Record* of September 30th and August 26th, they were in outline as follows:

1. By the associated bridge engineers, Wilbur J. Watson & Co., Cleveland; William R. Davis, Albany, N. Y., and Harlan D. Miller, Albany, N. Y., and Oakland, Cal. A bridge to extend from First and Adeline Streets, Oakland, to Second and Townsend Streets, San Francisco. It was to have 200- and 250-ft. steel spans, with clearances of from 20 to 90 feet, including one bascule or lift span with 200-ft. waterway. The estimated cost, \$23,900,000, was to be met

by bonding a bridge assessment district made up of San Francisco, Oakland, Alameda, Berkeley, and adjacent towns. The estimated revenue from the traffic on the bridge would pay for its construction in about 25 years.

2. By Charles Evan Fowler, in association with Gustav Lindenthal, Frank C. Osborn, Edwin Duryea, Jr., and Prof. Charles B. Weing, of Seattle. Bridge of cantilever type, with three 2000-ft. spans, 150 feet high, between Telegraph Hill, San Francisco, and Goat Island, then from Goat Island to Oakland, with 2950 feet of approach, including an 800-ft. cantilever span. The estimated cost was \$75,000,000, which would be raised by the formation of a private corporation to build the bridge and take over the transbay transportation systems and charge a 5-cent rate for street car and bridge.

3. By Alan C. Rush, of Los Angeles. Suspension bridge from Alameda shore to Rincon Hill, San Francisco. It was to be 180 feet high, with spans of 2000 feet. The estimated cost was \$32,000,000. It was proposed that Oakland and San Francisco should donate terminals and secure two-thirds of the bridge stock.

4. A fourth plan, by Col. Robert A. Lee Van Folkenberg, for a pontoon bridge to cost \$19,000,000 was presented at the final hearing on August 17th.

Opinion was not unanimous for a bridge as a tunnel was advocated by Taggart Aston, modeled after the Detroit tunnel, to cost \$15,000,000 for one double tube. Charles F. Reuter offered plans for tubes and terminals at an outlay of \$33,000,000; Jerome Newman filed a plan for a trench type of tunnel; and John G. Little proposed a low bridge or roadway for the greater part of the distance across the bay, leaving open only a 2000-ft. channel, which could be traversed through a tube.

**QUEBEC BRIDGE ACCIDENT.** The second serious disaster attending the construction of this great bridge with its record cantilever span of 1800 feet occurred on Sept. 11, 1916, at 10.50 A. M., while the centre suspended span completing the structure was being hoisted into place. This suspended span of nickel steel 640 feet long and 88 feet wide and weighing some 5000 tons, broke from its suspending stirrups by which it was being hoisted, crumpled up, and slid into the stream, involving the loss of 11 workmen in addition to those injured. The first disaster to the new Quebec Bridge, Aug. 29, 1907 (see YEAR BOOK for 1907), in which some 74 lives were lost, led to the improved design and reconstruction of the bridge. The completion of the cantilever arms on either side had been effected and the final work remained of placing the central or suspended span connecting them. This span had been assembled and erected at Sillery on staging over the shallow waters of Victoria Cove, about three miles down the river from the bridge site. It was then floated from the timbers on six scows and towed to the permanent location by tugs. The task was to hoist the span to its position, a vertical distance of 145 feet, by means of suspended lifting chains and girders under each corner of the span. The lifting was done by hydraulic lifting jacks installed on the cantilever arms, and each operation involved a lift of about two feet and required approximately 15 minutes. Accord-

ingly there would have been required some 73 successive lifting operations which would have consumed about 20 hours.

The raising of the span was made an important occasion, many visiting engineers being present, but fortunately only the workmen concerned were admitted to the span itself and but few to the cantilever arms. The suspended span had been brought into position successfully and had been hung to the cantilever arms by the hanger chains and attached to the mooring truss. By the action of the tide and the lifting jacks the span had been raised free of the barges, which were then removed. The hoisting chains connected in pairs to lifting girders on which the span rested accordingly carried the load for over an hour, in the course of which it was raised some 10 or 15 feet. Then occurred the disaster. The southwest corner of the suspended span slipped out of its supporting stirrup, the trusses crumpled, and the entire structure, working free, slid from its supports into the river, where it sank.

Thus occurred the second catastrophe in the erection of the world's greatest bridge where more than ever before care had been spent on the design and erection, and on the test of the materials used. Indeed it came as a shock to engineers and for that reason the critical analyses and study of the disaster received detailed attention in the engineering journals. There was no criticism of the method, or its execution, and the strength of the cantilever arms under the shock was demonstrated. But it was shown that sufficient attention had not been paid to the cast steel rocker bearing interposed between the bottom of the southwest corner of the span and the lifting girder upon which it rested and to which the hoisting chains were attached. Here a fracture and breaking down occurred, the lifting girder kicked back from its position, and this corner being released developed stresses beyond the resistance of the trusses making up the span, leading to its failure and breaking free from all supports. This rocker bearing was mounted on top of the lifting girder which carried a steel shoe casting with a longitudinal pin groove, carrying a pin  $9\frac{1}{2}$  inches in diameter and  $46\frac{1}{2}$  inches in length. On this pin rested the steel rocker casting which broke and this carried in turn a short transverse pin  $26\frac{3}{4}$  inches in length and 8 inches in diameter. Attached to the end post of the span and resting on this pin was the upper shoe. This arrangement made possible compensating for any unevenness or movement in the hoisting and had served during the support of the span at its point of original erection and on the scows.

The accident naturally gave rise to elaborate investigation of its cause and it was determined that the rocker casting that failed was too weak for its service by its very design, as indeed were the other three, one of which had to carry nearly twice the normal load. The stress was higher than would be considered safe for other parts of the structure where more dependable materials were used. Arrangements were made immediately after the disaster for the reconstruction of the span without essential modifications in design and material. For full discussion of the accident see *Engineering News*, particularly issues for September 21st and October 5th.

**DESTRUCTION OF CERNAVODA BRIDGE.** The record of the year includes destruction as well as construction, and perhaps the most notable bridge to suffer was the great cantilever bridge across the Danube at Cernavoda, Rumania. This bridge, stated to be the longest span cantilever bridge in continental Europe, was wrecked by the Rumanian army in its retreat on October 26th (see WAR OF THE NATIONS). The structure was of extraordinary length—the iron work 13,460 feet—and comprised the Cernavoda bridge proper, 2460 feet; the approaches to Cernavoda bridge, 3000 feet; the viaduct on Balta island, 4770 feet; Borcea bridge, 1380 feet; and approaches to the Borcea bridge, 1840 feet. The bridge was  $5\frac{1}{2}$  years in construction and was completed in 1896.

The exigencies of war, however, require construction as well as demolition and an event of the year was the rebuilding of the great Poniatowski Bridge across the Vistula at Warsaw by the Germans. This bridge had been destroyed by the Russians when they evacuated the city in August, 1915.

A notable addition to bridge literature was the publication during the year of a two-volume treatise on *Bridge Engineering* by Dr. J. A. L. Waddell (New York). This work has a valuable summary of the evolution of bridge engineering as well as many discussions of modern practice and theory.

**BRITISH ASSOCIATION.** See ADVANCEMENT OF SCIENCE, BRITISH ASSOCIATION FOR THE

**BRITISH COLUMBIA.** A province of the Dominion of Canada, extending from Alberta west to the Pacific Ocean and Alaska. The capital is Victoria. Area, 355,855 square miles, of which 2439 water. Between 1901 and 1911 the population increased 119.68 per cent, or 178,857 to 392,480. The city of Vancouver had in 1911 100,401 inhabitants, being the fourth city in size in Canada; Victoria, 31,660; New Westminster, 13,199; Nanaimo, 8306; Nelson, 4476; Prince Rupert (now western terminus of the Grand Trunk Pacific Railway), 4184. Of the population 10 years of age and over in 1911, males numbered 218,646 (66.82 per cent) and females 108,547 (33.18); of these, 189,482 males and 16,627 females were reported as employed in gainful occupations. Of the males employed 16.7 per cent were credited to agriculture, 15.4 transportation, 12.7 agriculture, 12.7 building trades, and 10.9 trade and merchandising; of the females, 42 per cent were in domestic and personal service, 19.6 in manufacturing, 19.5 professional, and 12.2 in trade and merchandising.

The provincial government is administered by a lieutenant-governor, appointed by the Governor-General of the Dominion; he acts through an executive council, or responsible ministry of seven members. The legislative assembly consists of one chamber of 42 members elected by direct vote for four years. In the 12th Parliament, which convened in 1911, British Columbia was represented by three senators and seven members of the House of Commons; the representation on the basis of the 1911 census is 13. Lieutenant-Governor in 1916, Frank Stillman Barnard, appointed to succeed Thomas W. Paterson, Dec. 5, 1914. Premier in 1916, H. C. Brewster. See AGRICULTURE.

**BRITISH EAST AFRICA.** A term sometimes applied to the East Africa Protectorate,

Copyright by International Film Service, Inc.

**COLLAPSE OF THE CENTRE SPAN OF THE QUEBEC BRIDGE, SEPTEMBER 11, 1916**

Uganda, and Zanzibar, regarded collectively. See the articles on these subjects.

**BRITISH GUIANA.** A British colony on the northeast coast of South America. Area, 90,277 square miles; population, 296,041 (153,717 males, 142,324 females). The unenumerated aborigines in the unfrequented parts of the country are estimated at about 10,000. Population (1911) of Georgetown, the capital, 54,318. Sugar production is now the chief industry. There are 43 sugar plantations, with a combined area of 162,139 acres (72,527 under sugar cane, 6448 under plantains, etc., and the remainder pasture or uncultivated). Rice is grown in the lowlands on about 42,000 acres. Balata, timber, and charcoal are also exported. Gold and diamond digging is carried on. About half the trade is with the United Kingdom and a third with the United States. Railways are as follows: Georgetown to Rosaigol, 60½ miles; Vreeden Hoop to Greenwich Park, 15; branch to gold diggings, 18¾. There are telegraph, telephone, and cable systems. In the following table the commercial statistics are for calendar years, financial figures are for fiscal years:

	1910-11	1911-12	1912-13	1913-14
	£	£	£	£

\* Tonnage entered and cleared.

A short railway leads 25 miles inland from the town of Stann Creek (2640 inhabitants).

**BRITISH INDIA.** See INDIA, BRITISH.

**BRITISH NEW GUINEA.** See PAPUA.

**BRITISH NORTH BORNEO.** The northern part of the island of Borneo, forming together with adjacent islands a British protectorate, under the jurisdiction of the British North Borneo Company. Area, 31,000 square miles. Population, about 208,000. The Straits Settlements dollar (worth \$0.56776) is now the standard coin. Completed railway, 130 miles. The company administers the country through a resident governor.

**BRITISH SOMALILAND.** See SOMALILAND PROTECTORATE.

**BRITISH SOUTH AFRICA.** See SOUTH AFRICA, UNION OF.

**BRITISH WEST AFRICA.** A collective name for the following British colonies and protectorates in western Africa: Nigeria, including colony and protectorate; Gold Coast, including Ashanti and the Northern Territories; Sierra Leone, including colony and protectorate; and Gambia, including colony and protectorate. See these separate titles.

**BROMINE.** See CHEMISTRY, INDUSTRIAL.

**BROOKE, STOFFORD AUGUSTUS.** A British clergyman and literary critic, died at Ewhurst, Surrey, March 18, 1916. He was born in 1832 at Letterkenny, County Donegal, Ireland, and after graduating with high honor at Trinity College, Dublin, was ordained a clergyman in the Church of England in 1857. In London he was minister of St. James's Chapel, York Street, for nine years (1866-75) and of Bedford Chapel from 1876 to 1894. While he held the latter charge, a change in theological views, which had been becoming gradually more marked in his sermons, led him to secede from the Established Church, and after 1880 he was known nominally as a Unitarian. For a time Dr. Brooke served as honorary chaplain to Queen Victoria, and was known as an eloquent preacher. But he will be remembered chiefly for his scholarly writings on the English poets, although he wrote in prose on other subjects and also in verse. Dr. Brooke was instrumental in having Dove Cottage purchased as a memorial to Wordsworth. He published, besides volumes of sermons and other works: *Life and Letters of the Late Frederick W. Robertson* (1865); *Theology in the English Poets* (1874); *Primer of English Literature* (1876); *History of Early English Literature* (1892), an important contribution; *Poetry of Robert Browning* (1902), one of the best criticisms of this poet; *Studies in Poetry* (1907); *Four Poets* (1908), treating of Clough, Arnold, Morris, and Rossetti. Dr. Brooke was to a large extent in sympathy with the literary, artistic, and social ideas of John Ruskin.

**BROOKLYN INSTITUTE OF ARTS AND SCIENCES.** An institution founded in 1824 and reincorporated in 1890. It consists of three departments, a department of education, the Brooklyn Museum (see PAINTING AND SCULPTURE), and Brooklyn Botanic Garden. The department of education, now in its twenty-eighth year, offers addresses, lectures, courses of instruction, concerts, and meetings, and maintains a biological laboratory. Nominal fees are required as payment for the privileges. One important feature of the educational system of the Institute is a school of pedagogy. Many important men are secured as speakers and the best artists provide the concerts. The Brooklyn Museum (of which William Henry Fox is director) is famous for its collections in three departments—art, ethnology, and natural science. The Botanic Garden, of which Dr. C. Stuart Gager is director, is also noted. Supplementing the work of the Institute, which is intended essentially for adults, is a children's museum and library. The total number of persons who took advantage of the varied departments of the Institute was 1,093,809 in 1915-16, as compared with 6900 in 1887-88. For the same years the receipts were respectively \$417,434.89 and \$4456.70 and the permanent funds \$785,773.18 and \$37,000. There are branches of the Institute at Jamaica and Huntington, Long Island.

President of the Board of Trustees, A. Augustus Healy.

**BROUGH, CHARLES H.** Elected Democratic Governor of Arkansas, Nov. 7, 1916.

**BROWN, FRANCIS.** An American theologian and educator, died in New York City, Oct. 15, 1916. He was born at Hanover, N. H., in 1849, graduated at Phillips Andover Academy, took the degree of A.B. at Dartmouth in 1870 and that of A.M. in 1873, and completed the course at Union Theological Seminary in 1877. After two years of further study at Berlin, he returned to be instructor in biblical philology at Union Seminary, with which institution he was thereafter connected till his death, becoming Davenport professor of Hebrew and cognate languages in 1890, and, in addition, president of the faculty in 1908. During 1907-08 Dr. Brown served as director of the American School of Oriental Study and Research in Palestine. In 1911, with Prof. William Adams Brown, also of Union Seminary, he was tried for heresy before the Presbyterian General Assembly, in session at Atlantic City. Rev. W. L. McEwan of Pittsburgh charged Dr. Francis Brown with the publication of statements in the *New York Observer* contrary to cherished Presbyterian and evangelical doctrines. Both theologians were exonerated. Dr. Brown held membership in various biblical, archaeological, and educational associations. He had received honorary degrees from Hamilton, Dartmouth, Yale, Williams, and Harvard, and from Glasgow and Oxford. His scholarly work includes: *Assyriology: Its Use and Abuse in Old Testament Study* (1885); *Hebrew and English Lexicon of the Old Testament* (1891-1906), with C. A. Briggs and S. R. Driver; *The Christian Point of View* (1902), with A. C. McGiffert and G. W. Knox.

**BROWNLOW, SIR CHARLES.** A British soldier, died at Bracknell, Berkshire, April 5, 1916. Born in 1831, at 16 he entered the Indian army as ensign and before he was 22 had served in the Punjab campaign which broke the power of the Sikhs and had won a medal at Hazara. After expeditions against various Indian tribes, and having taken command of the eighth regiment of Punjab infantry, which he raised, he was with the China Expeditionary Force at the occupation of Peking. For his services during the Lushai Expedition of 1871-72, he was made a K.C.B. and he was aide-de-camp to Queen Victoria for 12 years. Brownlow held the rank of brigadier-general during five years in Bengal, and was Assistant Military Secretary at the War Office, London, from 1879 to 1889. Meanwhile he had been promoted G.C.B., and on his retirement became general. A field marshal from 1908, he was at his death the oldest British soldier of that rank.

**BROWN UNIVERSITY.** A non-sectarian educational institution at Providence, R. I. It was founded in 1764. Among its departments is a Woman's College. The total enrollment in the fall of 1916 was 1134, and the faculty numbered 72. During the year Dr. Camillo von Klenze, head of the department of German, resigned and went to the College of the City of New York. There were no noteworthy benefactions to the university. The productive funds amounted to \$4,581,911 in 1916. The library contains 235,000 volumes. President, William H. P. Faunce.

**BRUNTON, SIR (THOMAS) LAUDER.** A British pharmacologist and physiologist, died in London Sept. 16, 1916. He was born at Hiltenshill, Roxburghshire, in 1844, and took the degrees of M.D. and D.Sc. at Edinburgh. Subsequently both Edinburgh and Aberdeen gave him the honorary LL.D. His medical studies included work in Paris, Berlin, Vienna, and Leipzig under the greatest physiologists of the day. By 1870 he had become a member of the Royal College of Surgeons of London, and by 1876 a fellow. For many years Brunton served as consulting physician to St. Bartholomew's Hospital. By his writings he gained a reputation as the leading authority on pharmacology and therapeutics in Great Britain. His *Experimental Investigation of the Actions of Medicine* (1875) is regarded as the first systematic textbook on experimental pharmacology, and his *Pharmacology, Therapeutics, and Materia Medica* (1885) as the first complete treatise on the subject from the viewpoint of the physiologist. The latter work appeared in English and American editions, and was translated into French, Italian, Spanish, and German. Brunton's Croonian Lectures of the Royal College of Physicians, delivered in 1889, and entitled "Relationship between Chemical Structure and Physiological Action" were the first to treat this subject. Among various contributions to medical science may be mentioned his introduction of the drugs which lower blood tension. He was knighted in 1900 and made a baronet in 1908, and in 1906 was vice-president of the Royal Society. Besides the books mentioned, he wrote: *The Bible and Science* (1881); *Circulation and Respiration* (2 series, 1907, 1916); and *Therapeutics of the Circulation* (1908).

**BRUSILOV, ALEXEI A.** See WAR OF THE NATIONS.

**BRYAN, WILLIAM JENNINGS.** See NEBRASKA; UNITED STATES, *Presidential Campaign*; UNITED STATES AND THE WAR.

**BRYN MAWR COLLEGE.** A non-sectarian institution for the education of women, at Bryn Mawr, Pa. It was founded in 1885. In November, 1916, there were 449 students in all departments, and the faculty and teaching staff numbered 67. Dean Marion Reilly resigned and was succeeded by Dr. Eunice Morgan Schenck. The most noteworthy benefaction of the year was a bequest of \$158,782 made by Elizabeth S. Shippen of Philadelphia. An anonymous donor gave the college \$15,000 to found a research fellowship and a new scholarship was provided for by a \$5000 bequest of Mr. George W. Kendrick. In the spring much publicity was given to criticisms by certain of the faculty members and former faculty members charging autocratic control of the affairs of the college by the president. At the time a reorganization looking to a more democratic system was in course of preparation. In 1916 the productive funds of the college amounted to \$2,185,135 and the income to \$387,664. The library contains 81,368 volumes. President, Miss M. Carey Thomas. See UNIVERSITIES AND COLLEGES.

**BUCKWHEAT.** The United States, almost the only country publishing regularly since the outbreak of the European war the annual acreage and production of buckwheat, according to estimates by the Department of Agriculture had a total yield in 1916 of 11,840,000 bushels from 845,000 acres as compared with a yield of

15,056,000 bushels from 769,000 acres in 1915. The average yield per acre for the two years was 14 and 19.6 bushels respectively and that for the five years 1910-14 was 20.6 bushels. The average price paid farmers on Dec. 1, 1916, was 112.9 cents or 34.2 cents more than on the same date the preceding year, and on this basis the total value of the 1916 crop was \$13,364,000 as compared with \$11,843,000 the year before and the highest recorded since 1868. Largely due to the shortage in the crop the price went higher than in years, and in November, 1916, good milling buckwheat sold in eastern producing centres for from \$2.50 to \$3.00 per 100 pounds, the legal weight per bushel being generally 48 pounds. Pennsylvania and New York continued to be the principal producing States.

Buckwheat in the United States is increasing in popularity as an orchard cover crop. It makes a rapid growth in the fall, mats down readily, making a cover protecting the ground, checks late growth in orchards, and can be plowed under early in spring. The Pennsylvania Experiment Station found it to be one of the best non-leguminous crops for this purpose and especially useful on soil recently cleared, where it tends to keep down the second growth of sprouts and underbrush.

**BUFFALO.** See EDUCATION IN THE UNITED STATES.

**BUHLIG, RICHARD.** See MUSIC, Artists, Instrumentalists.

**BUILDING OPERATIONS.** The general prosperity of the United States in 1916 was reflected in the large amount of building, both public and private, that was taking place. Reports from the building departments of the larger cities indicated great building activity throughout the year, every month except August and September showing a distinct improvement over 1915 and the aggregate for the year of 85 of the most important cities an increase of no less than 19.4 per cent. The figures by months as compiled by *Dun's Review* were as follows:

	1916	1915
December, 82 cities .....	\$58,827,827	\$57,679,278
November, 90 cities .....	62,581,756	58,111,878
October, 86 cities .....	72,532,350	60,151,479
September, 90 cities .....	58,380,188	61,028,645
August, 89 cities .....	60,758,321	63,867,428
July, 87 cities .....	103,016,666	59,597,079
June, 86 cities .....	72,408,488	57,738,981
May, 84 cities .....	100,149,728	74,373,076
April, 83 cities .....	76,927,860	66,980,612
March, 85 cities .....	72,933,633	63,390,427
February, 82 cities .....	47,580,578	40,105,569
January, 81 cities .....	46,378,478	34,013,692
Totals for years .....	\$882,425,818	\$696,977,139

The same general trend for the year is shown in a somewhat similar compilation of contracts in the engineering and building line for both public and private work actually awarded, published by F. W. Dodge Co., and covering the States of New England, New York, New Jersey, Pennsylvania, Maryland, and Delaware, District of Columbia, Virginia, Ohio, West Virginia, Illinois, Indiana, Iowa, Wisconsin, Michigan, North and South Dakota, and portions of Missouri and eastern Kansas. Comparative figures for several years were as follows:

Contracts awarded for the year 1916 ... \$1,356,989,897  
 Contracts awarded for the year 1915 ... 940,089,334

Contracts awarded for the year 1914 .....	720,241,800
Contracts awarded for the year 1913 .....	857,693,500
Contracts awarded for the year 1912 .....	868,108,000
Contracts awarded for the year 1911 .....	777,456,818
Contracts awarded for the year 1910 .....	805,700,899

The statistics for the States of New York and New Jersey were as follows:

Contracts awarded for the year 1916 .....	\$283,659,500
Contracts awarded for the year 1915 .....	169,794,734
Contracts awarded for the year 1914 .....	129,204,500
Contracts awarded for the year 1913 .....	261,007,500
Contracts awarded for the year 1912 .....	232,167,000
Contracts awarded for the year 1911 .....	227,912,500
Contracts awarded for the year 1910 .....	254,819,000

**BUILDING IN NEW YORK CITY.** In New York there were filed with the Bureau of Buildings in the year 1916 plans and specifications for 564 buildings to cost \$114,690,145, as compared with 489 new buildings to cost \$64,652,869 in 1915. This was an increase for the year of \$50,000,000, or 73 per cent. For the same period there was an advance in the number of plans for alterations from 3237 to cost \$9,019,806, to 3884 to cost \$19,387,899. This was a gain of \$10,000,000, or about 110 per cent for the year.

A comparison of the number and value of the plans for new buildings by months is of interest as it shows that the plans filed reached their greatest valuation in the month of July, when the aggregate amount was \$45,472,000. This was a natural result of the restriction of buildings to certain areas depending upon their use, size, and construction in pursuance of a zoning and districting plan adopted by the city authorities which went into effect in August. (See CITY PLANNING, *New York Zoning Regulations*.) Plans filed in July, 1916, exceeded the total for any month in either 1916 or 1915, the next largest month being May, 1916, with \$16,963,000, when the same influences were at work. The sum for June, 1916, was \$16,126,000. The figures for the month of December alone were 34 buildings to cost \$4,022,000, as compared with 29 buildings to cost \$3,601,000 in December of the year before.

The largest month in 1915 was May, with a total of 38 buildings to cost \$13,566,000. This included, however, the plan for the \$10,000,000 County Court House.

The accompanying tables for the city of New York show a comparison of the number of new buildings and the estimated cost for the year 1916 and also 1915:

Month	1915		1916	
	No. of Bldgs.	Estimated Cost	No. of Bldgs.	Estimated Cost
January ..	27	\$7,880,100	32	\$4,588,950
February ..	40	4,982,900	15	2,393,845
March .....	47	4,134,025	56	5,262,800
April .....	69	5,834,740	61	7,028,700
May .....	38	13,566,625	65	16,963,600
June .....	37	3,290,880	75	16,126,500
July .....	50	4,097,080	101	45,472,250
August .....	43	7,260,500	39	3,151,500
September ..	28	3,739,850	26	2,271,000
October .....	42	2,420,750	44	6,009,800
November ..	39	3,894,400	16	1,398,850
December ..	29	3,601,569	34	4,022,850
Total ..	489	\$64,652,869	564	\$114,690,145

In the case of new buildings the classification of their use and their estimated cost for the entire year 1916 was as follows:

Classification—	No. of Bldgs.	Estimated Cost
Dwelling houses—		
Estimated cost over \$50,000.....	80	\$2,869,000
Estimated cost between \$20,000 and \$50,000 .....	5	185,000
Estimated cost under \$20,000...	8	11,700
Tenements .....	183	87,841,500
Hotels .....	27	26,717,000
Stores, lofts, etc.—		
Estimated cost over \$30,000....	45	17,817,650
Estimated cost between \$15,000 and \$30,000 .....	5	107,000
Estimated cost under \$15,000...	16	106,000
Office buildings .....	43	12,651,500
Manufactories and work shops....	35	6,167,600
School houses .....	3	795,000
Churches .....	10	858,500
Public buildings—		
Municipal .....	9	969,000
Places of amusement, etc.....	30	3,639,500
Hospitals .....	2	1,000,000
Stables and garages .....	87	2,910,100
Other structures .....	31	44,095
<b>Total .....</b>	<b>564</b>	<b>\$114,690,145</b>

See ARCHITECTURE; CITY PLANNING; CONCRETE.

**BUKOWINA.** An Austrian crownland south of Eastern Galicia, bounded by Russia and Rumania on the east and Rumania on the south. Area, 4031 square miles. Population at the census of Dec. 31, 1910, 800,098, compared with 730,195 in 1900. The natural increase in the decade was 104,857 and the net emigration 34,954. Of the inhabitants in 1910, 547,944 (68.49 per cent) were returned as adherents of the Orthodox Church; Catholics (including those of the Roman, Greek, and Armenian rites), 125,404 (15.67 per cent); Jews, 102,919 (12.86 per cent); Evangelicals, 20,513 (2.56 per cent). The number of Austrian subjects in 1910 was 794,929; Ruthenian was the vernacular of 305,101 (38.38 per cent) of these; Rumanian, 273,254 (34.38 per cent), which includes almost all Rumanian-speaking Austrians; German, 168,851 (21.24 per cent); Polish, 36,210 (4.55 per cent); Hungarian, 10,391 (1.31 per cent), which includes almost all Austrians of Hungarian vernacular. Of the population in 1910, those dependent on agriculture constituted about 71.1 per cent; industry and the trades, 10.4 per cent; commerce and transportation, 9.4 per cent; public and military service, 9.0 per cent. The capital of the Bukowina is Czernowitz, on the right bank of the Pruth, which has developed into an important city largely within the last 40 years; it is the seat of one of the eight Austrian universities; its notably mixed population numbered 87,113 at the 1910 census. Other towns of some importance are Radautz, with 16,640 inhabitants in 1910; Suczawa, 11,401; Storozynetz, 10,353. See WAR OF THE NATIONS.

**BULGARIA.** One of the Balkan States; a constitutional monarchy of Europe; formerly a principality under the suzerainty of Turkey. An ally of the Central Powers in the War of the Nations. Capital, Sofia.

**AREA AND POPULATION.** Area and population previous to the Balkan wars are shown below:

	Area sq. km.	Sq. m.	Pop. 1910
Bulgaria, Northern.....	63,751.1	24,614	3,095,785
Eastern Rumelia .....	32,594.4	12,585	1,241,778
<b>Total Bulgaria.....</b>	<b>96,345.5</b>	<b>37,199</b>	<b>4,337,513</b>

Area acquired from Turkey (1913) is stated at 25,257 square kilometers, with an estimated population of 656,535; area ceded to Rumania, 7525 square kilometers, with 282,131 inhabitants. Total area, 114,017 square kilometers, with a population of 4,711,917.

Of the total population in 1910, 3,497,794 were Bulgarians, 466,117 Turks, 121,435 Tziganes, 79,787 Rumanians, 43,272 Greeks, 40,118 Jews, 21,145 Pomacs, 18,050 Tatars, 12,914 Armenians, etc. Belonging to the Orthodox Church were 3,643,951; 602,101 were Mohammedans, 40,070 Jews, 32,130 Catholics, 12,270 Armenian-Gregorians, 6262 Protestants, and 739 were of other persuasions. The capital, Sofia, had, in 1910, 102,312 inhabitants; Varna, 47,981; Ruschuk, 36,255; Slivno, 25,142; Shumla, 22,225; Plevna, 23,049; Stara-Zagora, 22,003; Tyrnova, 12,649; Dubnitsa, 11,601; Philippopolis, the capital of Eastern Rumelia, 47,981. In the new territory, Gümüljina, 30,033; Xanthi, 18,200.

**PRODUCTION.** About five-sevenths of the population are engaged in agriculture of a comparatively primitive order. A fertile soil and a favorable climate do much to offset the backwardness of the methods employed. No later figures are available than those given in the preceding YEAR BOOK.

**COMMERCE AND COMMUNICATIONS.** By governmental decrees the export of corn was prohibited from Jan. 19, 1915, but permitted for the 1914 crop from July 14, 1915, and then again entirely prohibited on Nov. 16, 1915. The export of rye was prohibited from Nov. 6, 1914, but permitted for the 1914 crop from Aug. 30, 1915, then completely permitted, until on Oct. 20, 1915, it was again entirely prohibited. The export of barley was prohibited from Nov. 6, 1914, but permitted for the 1914 crop from Aug. 3, 1915, and again entirely prohibited from September 20, 1915, in respect to every description of barley. By governmental decree of Nov. 16, 1914, the export of wheat, rice, oats, and spelt was definitely prohibited.

Import and export values are shown in the table below in thousands of leva:

	1909	1910	1911	1912	1913
Imports .....	160,430	177,357	199,345	218,110	189,421
Exports .....	111,484	129,052	184,684	156,407	93,205

In the table below are shown principal articles of trade, with values for 1913, in thousands of leva:

Imports	1000 l.	Exports	1000 l.
Textiles, etc. ....	83,458	Cereals .....	54,891
Machinery, etc. ....	27,808	Perfumes .....	7,788
Col. Prods. ....	13,748	Col. Prods. ....	6,917
Metals .....	13,515	Animals Prods. ....	9,486
Skins, etc. ....	11,800	Animals .....	1,677
Oils, etc. ....	7,338	Leather goods....	4,113

Austria-Hungary furnished imports valued at 54,863 thousand francs and received exports valued at 14,412 thousand. Germany, 37,079 and 16,884; Russia, 31,671 and 581; Great Britain, 16,881 and 7950; France, 12,987 and 5085; Rumania, 8787 and 1191; Turkey, 6379 and 4228.

Railways in operation (1913), 2233 kilometers belonging to the state and 241 kilometers to private companies; under construction, 140 kilometers.

FINANCE. The unit of value is the lev, worth 10.3 cents. A table showing revenue and expenditure for three years in leva is given below:

	1911	1912	1913
Revenue . . . .	198,795,814	170,038,592	168,724,841
Expenditure . .	182,487,552	158,665,948	167,771,466

The 1915 budget estimated the revenue at 275,379,886 leva and the expenditure at 275,366,200. The debt stood, June 30, 1915, at 1,155,732,710 leva.

NAVY. The navy includes 6 first-class torpedo boats (*Smely, Hrabry, Derzky, Choumny, letiachty, and Strogly*), of 100 tons each; 1 cruiser (*Nadejda*), of 735; 2 yachts, 5 transports, 2 second-class torpedo boats of 20 tons each, and some other small craft.

GOVERNMENT. The treaty of Berlin (July 13, 1878) created Bulgaria an autonomous and tributary principality of the Turkish Empire. To it was added Eastern Rumelia in 1885. In 1908 Bulgaria became an independent monarchy. She joined the Central Powers in October, 1915; and on the 13th day of that month the machinations of Premier Radoslavoff and King Ferdinand reached their culmination in the decision to declare war on Serbia.

Ferdinand I, King of the Bulgarians, was born at Vienna, Feb. 26, 1861, son of Prince Augustus of Saxe-Coburg and Gotha. Prince Boris (born Jan. 30, 1894) is the eldest son by the King's first marriage, in 1893, to Princess Marie Louise of Parma. His second wife (Feb. 28, 1908) is Eleonore of Reuss Köstritz.

HISTORY. In his address to Parliament toward the end of 1915 King Ferdinand was reported as saying that the Bulgarian attacks on Serbia were due to the latter's "incurable obstinacy" in refusing to recognize Bulgaria's rights in Macedonia, and as referring to the repulse of British and French troops sent "against the tortured Bulgarian nation in order to maintain Serbian tyranny over it." The German influence in Bulgaria was said to have become firmly fixed during the year 1915, and on January 1st, it was reported from Allied sources that German officials completely controlled the entire administration. The Kaiser paid a visit to King Ferdinand at Nish, where a banquet was held January 18th, to celebrate the anniversary of the institution of the Order of the Black Eagle. Formal speeches of compliment and congratulation on the alliance of the two Powers were made. For Bulgaria's part in the war, see WAR OF THE NATIONS. Parliament had warmly supported the war policy from the first. On December 29th all parties in the Sabranje had united in voting the war credits amounting to \$100,000,000, and had voted \$6,000,000 for the support of soldiers' families. Little definite information as to internal conditions during the year was available. It was announced on March 21st, that the Premier of Bulgaria, M. Radoslavoff, had been attacked by a post office employee named Ivanoff in Sofia, but the assailant succeeded only in wounding the coachman and was subsequently disarmed and captured. The address of the Bulgarian Prime Minister, M. Radoslavoff, at the opening of the Sobranje in December, 1916, was noteworthy for its thoroughgoing presentation of the Bulgarian case. Following the example of the German Chancellor, he went into the origin of the war,

but especially discussed the relations with Rumania. These relations, said he, had always been friendly even after the hostile conduct of Rumania in 1913 and her seizure of the Dobrudja so late as 1915. When the hostilities against Serbia began, the Rumanian cabinet promptly pledged to the Bulgarian government her neutrality to the end of the war. Bulgaria had also received assurances from Athens or Berlin that King Constantine would disregard the treaty with Serbia. Assured of this neutrality the Bulgarians had attacked the Serbians in August, 1916. However, said M. Radoslavoff, the Bulgarian government had become convinced of the hostile designs of its neighbors. At the end of that month the Rumanian Minister gave new evidence of friendship for Bulgaria by circulating the rumor that his government, wishing to remain on good terms with Bulgaria, was willing to surrender the portion of Dobrudja annexed in 1913 in return for an engagement on the part of Bulgaria that she would maintain a pacific attitude if Rumania attacked Austria. This was a mere ruse for the purpose of gaining time, but it had some effect on Bulgarian opinion. Nevertheless, the Bulgarian government did not permit itself to be deceived and when the Rumanian Minister sought an audience with M. Radoslavoff, President of the Council, the latter refused to receive him. He, himself, had made similar overtures to all the Powers of the Entente the year before and each of them had evaded an answer. It would appear from this speech that Bulgaria had carefully followed the policy of allowing the Rumanians to think that she would remain neutral. This policy succeeded and Rumania, as well as the Powers of the Entente, cherished the illusion. M. Radoslavoff went on to say that the retreat from Monaatir was only temporary and that later they would not only regain this lost ground but push farther on. He concluded his discourse with the following threat: "The time has come when the Allied governments will be able to give their parliaments good news which will receive the approval of all their people." This was interpreted by the Entente press as hinting at some plan for the partition of the occupied territory. At the close of the year, the Bulgarian Prime Minister, replying to certain critics in regard to the conduct of the war, said, "I assure you that the essential part of the task of Bulgaria has been accomplished. To those who complain that our desires are excessive I reply that we are not fanatical, that we understand the aspirations of the Bulgarian people, and that the royal manifesto on the occasion of the declaration of war has told you what these aspirations are." To those who criticized the seizure of the Danube by Bulgarian troops, the Prime Minister said that it had been ordered by the high command because it was necessary to pursue and destroy the Rumanian army. As to criticism of the part played by Germany and Austria in the Bulgarian army, he said, "Every German and Austrian officer in Bulgaria is under the command of Bulgarian officers."

**BUREAU OF SOCIAL HYGIENE.** See SOCIAL HYGIENE, BUREAU OF.

**BURLEIGH, EDWIN CHICK.** An American legislator, died at Augusta, Me., June 16, 1916. He was born at Linneus, Me., in 1843, and was early a teacher and land surveyor, and later a

clerk in several State offices. From 1886 to 1888 he held the post of State Treasurer, having been elected as a Republican, and from 1889 to 1892 that of Governor. In 1896 he was a delegate at large to the national convention of his party. In the United States House of Representatives, he saw continuous service from 1897 to 1911, and in 1913 became a member of the Senate. His term would have expired March 3, 1919. From 1887 Senator Burleigh published the *Kennebec Journal*, but his political activity was almost without break, so that only during a few years did he devote his main attention to his paper.

**BURMA.** The largest and easternmost province of British India. Geographically Burma is Indo-Chinese rather than Indian. Area, 230,839 square miles. Population according to the 1911 census, 12,115,217; of these, 1,127,975 were recorded as urban and 10,987,242 rural. Buddhists numbered 10,384,579. The capital is Rangoon. See AGRICULTURAL EXPERIMENT STATIONS.

**BURNETT, HENRY LAWRENCE.** An American lawyer and soldier, died Jan. 4, 1916, in New York City. He was born at Youngstown, Ohio, in 1838, and was educated at Chester Academy and at the Ohio State National Law School, from which he graduated in 1859. After a short period of law practice, he was elected a captain of Ohio cavalry, and served in the Civil War, rising to be brevet major-general of volunteers. In 1863, as judge-advocate of the Department of Ohio, he was sent to Indiana to prosecute the Sons of Liberty, several of whom were convicted and executed. With others, in 1865, he had charge of the investigation into the assassination of President Lincoln. After the war, General Burnett practiced law in Cincinnati, and, from 1872, in New York, where he gained an important place. By appointment of President McKinley, in 1898, he became United States District Attorney for the Southern District of New York State.

**BURNHAM, EDWARD LEVY-LAWSON,** first Baron. An English newspaper owner and editor, died Jan. 9, 1916, in London. He was born of Jewish parents in 1833 in London, and was known as Edward Levy until 1875, when, in consideration of a deed of gift, he added his uncle's name. After graduating from the University College School in London, he entered his father's printing establishment, and took charge of what was then an insignificant paper, the *Daily Telegraph and Courier*. On this he wrote leading editorials, as well as supervised the management, and his vigorous and enthusiastic efforts soon resulted in enlarged circulation. This, the first paper to be reduced in price from twopence to a penny, at once attracted the attention of the middle classes, and its news and advertising policies were aimed toward keeping this clientele. For many years it was the largest London paper, in number of news columns; lavish expenditures were made for telegraph and cable tolls; and every newest device for increasing the efficiency of a great newspaper plant was installed. Charitable and other public causes found in the *Daily Telegraph* a ready champion, one of the most notable instances of this policy being the aid rendered the Lancashire cotton spinners at the time of the American Civil War. It was this paper also which sent Henry M. Stanley to

Africa. Edward Levy-Lawson was made a baronet in 1892, was raised to the peerage as Baron Burnham in 1903, and received the K.C.V.O. the next year. In 1886 he served as president of the Royal Institute of Journalists, and in 1913, on the occasion of his eightieth birthday, a remarkable tribute was paid to him by the leading journalists of the world. Although he turned over active supervision of the *Daily Telegraph* to his son in 1903, Lord Burnham remained in close touch with its policies.

**BURNQUIST, J. A. A.** Reflected Republican Governor of Minnesota, Nov. 7, 1916.

**BURRILL, THOMAS JONATHAN.** An American botanist and educator, died April 14, 1916, at Urbana, Ill. He was born at Pittsfield, Mass., in 1839. For three years after graduating from the Illinois State Normal University, he was superintendent of schools at Urbana (1865-68), and thereafter, till his retirement in 1912, was connected with the University of Illinois—as professor of botany and horticulture for 33 years and then for nine years as professor of botany alone. He was also vice-president of the university from 1879 to 1912 and at various times was dean of the college of science, dean of the general faculty, dean of the graduate school, and acting president. For 24 years he held the post of botanist of the United States Agricultural Experiment Station at Urbana. Dr. Burrill was a fellow or member of various scientific societies, was president of the American Microscopical Society in 1885-86, and at the time of his death was vice-president of the botanical section of the American Association for the Advancement of Science. His writings include some 200 articles in educational and botanical journals and reports.

**BURROUGHS, EDITH WOODMAN.** An American sculptor, died Jan. 6, 1916, in Flushing, Long Island. Born at Riverdale-on-Hudson, N. Y., in 1871, she studied in New York at the Art Students' League under Saint-Gaudens, and in Paris under Inglebert, and for two years in Luc Olivier Merson's school. In 1893 she married Bryson Burroughs, an artist who became curator of paintings in the Metropolitan Museum, New York. She exhibited at the Champs de Mars, Paris, and in the United States, became a member of the National Sculpture Society, and received the Shaw Memorial prize from the National Academy of Design, of which body she was elected an associate. Mrs. Burroughs became especially known for her marble busts and figures of children, distinctive in their grace and charm. Her attention was devoted also to decorative sculpture, two fountains designed by her being at the Panama-Pacific Exposition, San Francisco, "The Fountain of Youth" and "The Arabian Nights." A sculptured portrait of John LaFarge by Mrs. Burroughs is in the Metropolitan Museum, New York.

**BUTTER.** See DAIRYING.

**CABIN CREEK FLOOD.** See FLOODS.

**CABRERA É IBARS, JUAN BAUTISTA.** A Spanish prelate and hymnologist, Bishop of the Spanish Reformed Church, died May 18, 1916. He was born in 1837 at Benisa, Valencia. He was brought up as a Roman Catholic and for a time taught in Pietist schools. After he had been ordained deacon and presbyter, a change of faith necessitated his exile to Gibraltar. Some years later he was enabled to return and to open in Seville the first Protestant chapel in Spain

(1869). Afterward he had a chapel in Madrid. In 1890 he was elected Bishop of the new Spanish Reformed Church, and in 1894 was consecrated by three prelates of the Irish Church headed by Archbishop Lord Plunkett, the Primate of Ireland, who gives an interesting account of the event in his *Memoirs*. Bishop Cabrera wrote on theological and historical subjects and became known as the most important Spanish hymnologist of the century. From 1874 he edited the religious paper *La Luz*. His literary work was recognized by election to the Hispanic Society of America.

**CADORNA, LUIGI, COUNT.** See WAR OF THE NATIONS.

**CALAVERAS DAM.** See DAMS.

**CALDER, WILLIAM M.** Elected Republican United States Senator from New York, Nov. 7, 1916.

**CALHOUN, WILLIAM JAMES.** An American diplomat and capitalist, died in Chicago, Sept. 19, 1916. Born in Pittsburgh, Pa., in 1848, he practiced law in Danville, Ill., from 1875 to 1898, then removing to Chicago, where he gained a lucrative practice as head of the firm of Calhoun, Lyford, and Sheehan. Mr. Calhoun's first public service was as special commissioner to Cuba, on appointment of President McKinley. He reported the need for intervention. For the two following years he served on the Interstate Commerce Commission. By President Roosevelt he was sent down to Venezuela in 1905, charged with the duty of adjusting relations that had become involved because of the schemes of Castro. From 1909 to 1913 he held the post of Minister to China, which he received through President Taft. Shortly before he left, he criticized sharply the American policy toward China, as controlled by President Wilson. Mr. Calhoun acquired important corporate interests in the American Steel and Wire Company, the Federal Steel Company, the Corn Products Company, and the Baltimore and Ohio Railroad.

**CALIBAN BY THE YELLOW SANDS.** See DRAMA.

**CALIFORNIA. POPULATION.** The estimated population of the State in December, 1916, was 2,983,843. The population in 1910 was 2,377,549.

**AGRICULTURE.** The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1915-16 were as follows:

	Acreage	Prod. Bu.	Value
Corn ..... 1916	64,000	2,048,000	\$2,540,000
..... 1915	64,000	2,624,000	2,309,000
Wheat .... 1916	350,000	5,600,000	8,512,000
..... 1915	440,000	7,040,000	6,888,000
Oats ..... 1916	200,000	6,500,000	4,680,000
..... 1915	211,000	6,963,000	3,482,000
Rice ..... 1916	67,800	4,543,000	8,544,000
..... 1915	84,000	2,268,000	2,041,000
Potatoes ... 1916	75,000	10,575,000	14,805,000
..... 1915	78,000	10,140,000	7,605,000
Hay ..... 1916	2,500,000	4,375,000	55,125,000
..... 1915	2,511,000	a 4,520,000	50,624,000
Cotton .... 1916	72,000	60,000	5,748,000
..... 1915	84,000	b 84,000	1,822,000
Rye ..... 1916	8,000	104,000	121,000
..... 1915	8,000	112,000	101,000
Barley .... 1916	1,190,000	83,320,000	81,654,000
..... 1915	1,860,000	89,440,000	24,458,000

a Tons. b Bales of 500 pounds each.

**MINERAL PRODUCTION.** Although there was a decrease in 1915 in the number of productive

mines in the State, the production of gold, silver, copper, lead, and zinc was \$6,553,199 more than in 1914. The production of gold in 1915 was 1,085,464 fine ounces valued at \$22,442,206, an increase of 86,533 fine ounces, valued at \$1,877,800. The deep mines of the State yielded 669,204 fine ounces of gold valued at \$13,833,679. The placer mines yielded 16,441 fine ounces valued at \$8,608,617. The silver production in 1915 was 1,678,756 fine ounces, valued at \$851,129, an increase of 206,897 ounces in quantity, and \$37,191 in value over 1914. The mined production of copper in 1915 was 40,751,625 pounds, valued at \$7,131,534, an increase of 10,243,933 pounds in quantity and \$3,074,011 in value of 1914. The lead produced in 1915 amounted to 4,579,245 pounds valued at \$215,225, compared with 4,251,923 pounds, valued at \$165,825 in 1914. The recoverable mined production of zinc in 1915 was 13,094,032 pounds, valued at \$1,623,660, compared with \$389,471 pounds, valued at \$19,863 in 1914, an increase of 12,704,561 pounds in quantity, and \$1,603,797 in value. This production is the largest ever made in the State.

In marked contrast to conditions in the last nine years the petroleum output for 1915 followed a decline. As a consequence of this decline, and of the remarkable increase of petroleum in Oklahoma, California was obliged to yield first rank among the oil producing States, which it had held since 1908. Although the decrease, 13,000,000 barrels, is greater than the combined output of petroleum of Pennsylvania, New York, and southwestern Ohio in 1915, it represents only a decline of 13 per cent below the quantity marketed in 1914. The decrease is due chiefly to the slight drilling activity in 1915, and does not indicate that the productive acres have been fully developed, or that the productive sands are becoming exhausted. The depressed condition of the market in crude oil during the year resulted in less development.

There was great activity in mining in the State in the first six months of 1916. Aside from gold, silver, copper, and lead there was, during the year, a heavy demand also for such mineral substances as chrome, tungsten, magnesite, manganese, antimony, etc., and a great many mines of this sort were opened. The copper mines were very active during the year, owing to the high price of metals. Gold mining continued at about the same pace as in 1915. A little less gold and silver were presented for the mint at San Francisco than in the previous year.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments..	7,659	10,057
Average number of wage earners .....	115,296	189,481
Capital invested .....	\$587,184,000	\$736,106,000
Wages .....	84,142,000	105,618,000
The value of materials used	325,288,000	447,474,000
The value of products ....	529,761,000	712,801,000

**TRANSPORTATION.** The total aggregate of track mileage operated in the State on June

30, 1916, was 11,963 miles. Of this 3071 miles were main line track owned by railroad companies; 6146 miles were operated under lease. The lines having the longest mileage were the Atchison, Topeka, and Sante Fé 2249, Southern Pacific, 6239, and the San Pedro, Los Angeles, and Salt Lake, 511.

**EDUCATION.** The school population of the State in 1916 was estimated by the State Superintendent of Education at about 600,000. The enrollment in that year was 544,590, divided as follows: Kindergarten 20,721, elementary 423,562, high schools 95,405, normal schools 4902. The average daily attendance in the kindergarten schools was 4154, in the elementary schools 340,943, and in high schools 58,881, or a total of 403,968. The men teachers numbered 2848, and the women teachers 15,012, a total of 17,860.

**FINANCE.** The latest statement of the financial condition of the State is for the biennial period 1912-14. During this period the cash receipts amounted to \$75,830,859, and the disbursements to \$66,530,156, leaving a balance at the end of the year of \$19,213,233.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions include State prisons at San Quentin and Folsom, the Preston School of Industry, the Whittier State School, California School for Girls, State Hospitals at Stockton, Napa, Agnew, and Mendocino, the Southern California State Hospital, the New State Hospital, the Sonoma State Home, the Folsom State Hospital, and the Industrial School for Adult Blind. The total expenditure for these institutions is about \$2,500,000 annually.

**POLITICS AND GOVERNMENT.** The political events in California during the year were of such a nature as to make them of national importance and interest. As a result of the primary election held on August 29th Governor Johnson became a candidate for the United States Senate, defeating Willis H. Booth by the nomination. California prior to the split in the Republican party in 1912 had been counted one of the sure Republican States, and it was thought by the Republican leaders that the elements in 1916 had so reunited as to place it again safely in the Republican column. It was found difficult, however, to reconcile the two elements of the party, chiefly because of the hostility between Governor Johnson and the leaders of the regular Republican wing; and, as it proved, these difficulties could not be reconciled. The main history of the campaign belongs in the article **PRESIDENTIAL CAMPAIGN**, and there it will be found in more detail. The election of Governor Johnson to the Senate by an overwhelming plurality, and the defeat of Mr. Hughes by a scant plurality served to indicate that the electorate had cast aside party lines, and had voted as it had never done before at a presidential election. Mr. Johnson's tremendous vote was due in part to the hold he had maintained upon the admiration of the California voters during his six years as chief executive of the State. A number of reasons have been given by the politicians of the State and elsewhere for Mr. Hughes's defeat. In the main the consensus seemed to prevail that he did not win the Progressive vote on account of his identification during his visit to the State with the Republican leaders, who

kept him from having any intercourse whatever with Governor Johnson. Women voted for the first time in the State in the presidential campaign, and while the assertion that President Wilson had kept the country out of war may have influenced the women's vote to a certain extent, it may be said on the whole that it was divided in practically the same proportion as that of the men. The total vote at the presidential election was 1,045,858, out of a total registration of 1,314,446. The vote for presidential electors was as follows: Democratic 466,889, Republican 462,516, Socialist 42,898, Prohibition 27,713. The Democratic plurality was 3773. For United States Senator Hiram W. Johnson received 574,667 votes, George S. Patton, Democrat, 277,852, Walter T. Mills, Socialist, 49,341, and Morris Atwood, Prohibitionist, 38,797. Johnson's plurality was 296,815. The constitutional amendment providing for prohibition was defeated. Two amendments were voted. Amendment No. 1 for straight prohibition received the following vote: Yes, 463,639; No, 538,200. Amendment No. 2 for partial prohibition: Yes, 461,039; No, 505,783. The State voted \$15,000,000 in bonds for the completion of a State highway system. A special session of the legislature was held during the year for the consideration of special measures chiefly of local interest.

**OTHER EVENTS.** In the first week in January, Matthew Schmidt was convicted as an accomplice of the McNamara brothers in the blowing up of the Los Angeles *Times* Building in 1910. The destruction of this building resulted in the death of 21 employees. Schmidt fled after the crime, and was not found until February, 1915, when he was arrested in New York City. He was sent to prison for life for the crime of murder in the first degree.

A decision of the United States District Court sitting at Fresno, was of great importance in relation to the oil fields of the State. In 1909 President Taft withdrew from settlement certain lands in the Mariposa District of the State, in which at the time there were no settlers, and on which no oil had been discovered. Sometime afterwards several oil companies entered the field and took from it oil valued at many millions of dollars. The government endeavored to oust these companies and to secure an accounting of oil taking. The decision of the court noted above authorized the prosecution of six suits against more than 100 defendants for such an accounting. It is said that the decision in favor of the United States might mean an award of over \$5,000,000. Twenty similar suits are pending.

As a result of area added in the municipal elections held in June, Los Angeles is the largest municipal area in the United States. Westgate and Occidental, containing together about 50 square miles, were annexed, making the total area 337.92 square miles. The area of New York is 314.75 square miles. The rapid growth in area has resulted from the completion of the \$23,000,000 aqueduct, which brings pure mountain water 250 miles by a gravity system in sufficient quantity for a city of 2,000,000. The total population of Los Angeles is now said to be about 550,000.

On July 22nd, a preparedness parade was held in San Francisco in which over 50,000 persons took part. The parade was marred by

the explosion of an infernal machine set off in a crowd, which caused the death of six persons and the injury of at least 25. The bomb escaped attention because it was hidden in an ordinary suit case, and was exploded by clock work. It went off just as the First California Regiment of Spanish-American War veterans were passing, and injured several of the members of this regiment. The parade continued as though nothing had occurred. Most of the damage was done among the spectators. The only clew to the perpetrators of the act was the fact that on the previous day an anonymous communication was sent to the various newspapers, threatening "a little direct action" to demonstrate that "militarism cannot be forced upon us and our children without a violent protest."

As a result of the six days' storm, which began on January 14th, the dam of the San Diego water system burst on January 28th. This resulted in floods throughout the southern part of the State, which caused the death of about 65 persons, made 3000 persons homeless, and destroyed property to the value of about \$200,000,000. During the last days of the month whole towns were destroyed, and many lives lost in the country around Los Angeles. Floods in the San Luis Rey Valley caused the death of many persons, and the loss of much property. See FLOODS.

On March 27th Governor Johnson issued a proclamation excluding from intra-State business in California about 5500 corporations, including the Ford Automobile Company, for failure to pay the State franchise tax of 1915. The Ford Company, whose tax amounted to \$24,000, refused payment on the ground that the sum was excessive.

See AGRICULTURAL LEGISLATION; ANTHROPOLOGY.

**STATE OFFICERS.** Governor, Hiram W. Johnson; \* Lieutenant-Governor, William D. Stephens; Secretary of State, Frank C. Jordan; Treasurer, Friend William Richardson; Comptroller, John S. Chambers; Attorney-General, U. S. Webb; Superintendent of Public Instruction, Edward Hyatt; Commissioner of Insurance, J. E. Phelps—all Progressives except F. C. Jordan and Edward Hyatt, Republicans.

**JUDICIARY.** Supreme Court: Chief Justice, Frank M. Angellotti; Associate Justices, William P. Lawlor, Lucien Shaw, H. A. Melvin, F. W. Henshaw, M. C. Sloss, and William G. Lorigan; Clerk, B. Grant Taylor.

STATE LEGISLATURE:

	Senate	House	Joint Ballot
Republicans	22	66	88
Democrats	10	11	21
Progressives	7	1	8
Independents	1	2	3
Republican majority	4	52	56

**CALIFORNIA, UNIVERSITY OF.** A co-educational State institution at Berkeley, Cal. (with certain professional schools in San Francisco). It was founded in 1860. The students numbered 12,529 in the academic year 1915-16 and the faculty 503. In 1916 two noted members of the faculty died, Eugene Woldemar Hilgard, emeritus professor of agriculture, and George

\* Takes seat in United States Senate, March 5, 1917.

Holmes Howison, professor of philosophy. Five buildings, built from a State bond issue of about \$2,000,000, were nearing completion in December: Wheeler Hall, named for the president of the university (a classroom building), costing \$700,000; a new wing for the library, costing \$525,000; an agriculture building (Hilgard Hall), costing \$350,000; a wing for the chemical laboratory, costing \$220,000; and a unit for the power plant. The department of physiology was divided into two departments, one of physiology and one of biochemistry and pharmacology; new departments of preventive medicine and home economics were established; and a faculty committee on international relations was appointed. A French library (6000 volumes) and \$160,000 in gifts were received. On June 30th the library of the university contained about 332,900 volumes. The university possessed in productive funds \$5,532,605 and in available income \$3,394,902. President, Benjamin Ide Wheeler.

**CAMBODIA.** A French protectorate, forming part of French Indo-China. The capital is Pnom-Penh; its population, which is variously stated, is probably over 60,000. Most of the foreign trade passes through Saigon (Cochin-China). See FRENCH INDO-CHINA.

**CAMEROONS.** See KAMERUN.

**CAMPBELL, THOMAS E.** Elected Republican Governor of Arizona, Nov. 7, 1916.

**CAMPFOB, SYNTHETIC.** See CHEMISTRY, INDUSTRIAL.

**CANADA, DOMINION OF.** A British self-governing dependency north of the United States. The capital is Ottawa, in the Province of Ontario.

**AREA AND POPULATION.** The area of Canada is computed at 3,729,665 square miles. The population was estimated March 31, 1915, at 8,136,000. Area by provinces and territories, in square miles:

	Land	Water *	Total *
Alberta	252,925	2,360	255,385
British Columbia	358,416	2,439	355,855
Manitoba	231,928	19,906	251,832
New Brunswick	27,911	74	27,985
Nova Scotia	21,068	360	21,428
Ontario	365,880	41,882	407,262
Prince Edward Island	2,184		2,184
Quebec	690,865	15,969	706,834
Saskatchewan	243,382	8,318	251,700
Yukon Territory	206,427	649	207,076
Northwest Territories	1,207,926	84,298	1,242,224
Canada	3,603,910	125,755	3,729,665

\* The water area is exclusive of Hudson Bay, Ungava Bay, the Gulf of St. Lawrence, and all other tidal waters, excepting that portion of the River St. Lawrence which is between Pointe-des-Monts in Saguenay and the foot of Lake St. Peter.

The areas of Manitoba, Ontario, Quebec, and the Northwest Territories, as given in the foregoing table, have been adjusted to conform to the Boundary Extension Acts of 1912, whereby these three provinces were enlarged by annexations from the Northwest Territories. The table below shows the area by provinces and territories before the Boundary Extension Acts became operative, the population according to the censuses of April 1, 1901, and June 1, 1911, and the increase per cent of population between 1901 and 1911; also, in the last column, the population in 1871:

	Sq. mi.	Pop. '01	Pop. '11	Incr.	Pop. '17
Alta.	255,285	78,022	374,668	418.08	.....
B. C.	355,855	178,657	892,480	119.68	36,247
Man.	78,732	255,211	455,614	78.52	25,228
N. B.	27,985	331,120	351,889	6.27	285,594

\* Decrease per cent.

The following table shows the increase of the area of Manitoba, Ontario, and Quebec, and the decrease of the area of the Northwest Territories, effected by the Boundary Extension Acts of 1912, together with the present area and the population adjusted to the 1911 census:

	Increase sq. mi.	Present area	Pop. '11
Manitoba	178,100	251,832	461,680
Ontario	146,400	407,262	2,527,292
Quebec	854,961	706,834	2,005,779
Northwest Territories	*679,461	1,242,224	5,900

\* Decrease.

The 1911 census returned the male population at 3,821,995, and the female at 3,384,648; the number of females to each 1000 males was 886, as compared with 952 in 1901. Deficiency of females is probably greater in Canada than in any other country. In 1911 the male population of Canada (exclusive of Yukon and the Northwest Territories) 18 to 45 years of age was 1,720,070, of whom 1,109,383 were Canadian-born, 306,377 British-born, and 304,310 foreign-born.

The number of inhabitants returned in 1911 as having been born in Canada was 5,619,682 (77.98 per cent); British Isles, 784,526 (10.89); British possessions other than Canada, 29,188 (0.41). There were 19,703 persons of British birth but unknown birthplace. Foreign-born inhabitants in 1911 numbered 752,732 (10.44 per cent). Persons born in Austria-Hungary numbered 121,430 (1.68 per cent); Russia (including Finland), 100,971 (1.40); Germany, 39,577 (0.55); Norway and Sweden, 49,194 (0.68); Italy, 34,739 (0.48); France, 17,619 (0.24); China, 27,983 (0.38); Japan, 8425 (0.12); the United States, 303,680 (4.21). In consequence of the great war, it is of interest to note that of the foreign-born inhabitants 177,720 came from Allied countries,

167,441 from enemy countries, and 407,571 from neutral countries. Of the total number of foreign-born, 344,557, or nearly 46 per cent, were naturalized British subjects in Canada; these included 60,949 persons born in Austria-Hungary, 23,283 in Germany, and 152,308 in the United States. Of the immigrant population born in the United States, 136,720 were of British, 45,374 were of German, and 1804 were of Austro-Hungarian origin. Of the total of 752,732 foreign-born persons in Canada in 1911, 470,927 (62.6 per cent) were males, the males among those of enemy countries being for Austria-Hungary 77,562 and for Germany 39,577. The immigration records show that for the fiscal years 1912 to 1915 78,999 Austro-Hungarians and 17,626 Germans entered Canada; no statistics of departures are available.

The 1911 census returned the urban population at 3,280,964 (45.53 per cent), and the rural population at 3,925,679 (54.47 per cent). In all Canada the urban population increased by 1,259,165 (62.28 per cent) between 1901 and 1911, while the rural population increased by only 576,163 (17.20 per cent). Population of the larger cities and towns at the 1911 census: Montreal (P. Q.), 470,480; Toronto (Ont.), 376,538; Winnipeg (Man.), 136,035; Vancouver (B. C.), 100,401; Ottawa (Ont.), 87,062; Hamilton (Ont.), 81,969; Quebec (P. Q.), 78,710; Halifax (N. S.), 46,619; London (Ont.), 46,300; Calgary (Alta.), 43,704; St. John (N. B.), 42,511; Victoria (B. C.), 31,660; Regina (Sask.), 30,213; Edmonton (Alta.), 24,900; Brantford (Ont.), 23,132; Kingston (Ont.), 18,874; Maisonneuve (P. Q.), 18,684; Peterborough (Ont.), 18,360; Hull (P. Q.), 18,222; Windsor (Ont.), 17,829; Sydney (N. S.), 17,723; Glace Bay (N. S.), 16,562; Fort William (Ont.), 16,499; Sherbrooke (P. Q.), 16,405; Berlin (Ont.), 15,196; Guelph (Ont.), 15,175.

The returns of the 1911 census on occupations of the people relate to persons 10 years of age and over and do not include the population (26,993) of Yukon and the Northwest Territories. Out of a total of 7,179,650, the occupation was recorded of 2,723,634, constituting nearly 38 per cent of the total population and 49 per cent of the population 10 years of age and over. Of the number engaged in gainful occupations 2,358,813 (79.5 per cent) were males, and 364,821 (14.3 per cent) were females. It must be remembered that women performing household duties in their own homes are arbitrarily regarded in the census as not being "gainfully employed" and are therefore excluded from the statistics of oc-

Occupations	1901					1911				
	Males		Females		Total	Males		Females		Total

cupations. The census revealed that the number of agricultural producers has not kept pace with the increase in population. From 1891 to 1911 the increase in the total population within the present limits of the nine provinces was 49.5 per cent, while the increase in the number employed in agriculture was only 27 per cent. However, the increase in the use of agricultural machinery offsets in some degree the decrease in the proportional number of primary producers. The number of persons employed in the various manufacturing industries increased over 116 per cent between 1891 and 1911, and the number employed in the distribution of commodities over 250 per cent. The table on the preceding page shows the number and percentage of male and female workers, and the percentage of total workers, in each industry, in 1901 and 1911.

As reported for fiscal years, immigration into Canada reached its highest point in the year ending March 31, 1913; a marked decline followed the outbreak of the great war. Below are shown the number of immigrant arrivals from the United Kingdom and the United States, the aggregate from other countries, and the total, for fiscal years:

	<i>U. Kingdom</i>	<i>U. States</i>	<i>Other</i>	<i>Total</i>
1912 ...	188,121	138,710	82,406	854,287
1913 ...	150,542	139,009	112,881	402,432
1914 ...	142,622	107,530	134,726	384,878
1915 ...	43,276	59,779	41,784	144,789
1916 ...	8,664	36,987	2,936	48,587

Immigrants whose destination was the Maritime Provinces numbered, in the fiscal years 1915 and 1916 respectively, 11,104 and 5981; Quebec, 31,053 and 8274; Ontario, 44,873 and 14,743; Manitoba, 13,196 and 3487; Saskatchewan, 16,173 and 6001; Alberta, 18,263 and 7215; British Columbia, 10,127 and 2836.

**RELIGION AND EDUCATION.** Adherents of the larger religious denominations according to the 1911 census, with the increase per cent since 1901: Roman Catholics, 2,833,041 (increase 27.06 per cent); Presbyterians, 1,115,324 (32.39); Methodists, 1,079,892 (17.78); Anglicans, 1,043,017 (53.05); Baptists, 382,666 (20.33); Lutherans, 229,864 (148.43); adherents of the Orthodox Church, 88,507 (466.26); Jews, 74,564 (354.63); Mennonites, 44,611 (40.30); Congregationalists, 34,054 (20.36).

Of the population six years of age and over at the 1911 census, viz., 6,154,511, the number returned as being unable to read was 521,842 (8.48 per cent). All the provinces except Quebec have compulsory-education laws. Except for certain small fees payable in parts of Quebec, elementary instruction is free and its cost is defrayed from the public revenues, provincial and local. The following table shows, for 1915, number of schools, of teachers, and of pupils enrolled, the percentage of average attendance, and the expenditure for public education (year ending December 31st for Alberta, Ontario, Prince Edward Island, and Saskatchewan; July 31st for Nova Scotia; and June 30th for British Columbia, Manitoba, New Brunswick, and Quebec):

	<i>Schools</i>	<i>Teachers</i>	<i>Enroll.</i>	<i>Av. at.</i>	<i>Expend.</i>

\* Figures are for 1914. † For elementary schools.

In the foregoing table, secondary schools are not included in the figures for Ontario and Quebec. Ontario had, in 1915, 160 collegiate institutes and high schools, with 1020 teachers, 38,426 students, and an average attendance of 64.60 per cent. Quebec had, in 1914: 718 model (intermediate) schools, with 3421 teachers, 114,738 pupils, and an average attendance of 82.15 per cent; 296 academies, with 3143 teachers, 76,550 students, and average attendance 85.16; 21 Roman Catholic colleges, with 726 teachers and 8444 students.

**AGRICULTURE.** In 1916 agricultural production was in general much smaller than in the preceding year. The following table shows for important crops the area in thousands of acres, in 1915 and 1916, and the production in thousands of bushels or tons, in 1914, 1915, and 1916 (figures for 1916 subject to slight revision):

	<i>Area</i>		<i>Production</i>		
	<i>1915</i>	<i>1916</i>	<i>1914</i>	<i>1915</i>	<i>1916</i>
	<i>ac.</i>	<i>ac.</i>	<i>bu.</i>	<i>bu.</i>	<i>bu.</i>

Fodder corn.	343	297	3,251	3,430	1,977
Sugar beets.	18	15	109	141	71
Alfalfa .....	93	90	218	262	261

The area estimated as under field crops in 1915 was 37,063,455 acres, as compared with 35,102,175 acres, the sown area, and 33,436,675, the harvested area, in 1914. The total value of field crops, computed at average local market prices, was \$797,669,500 in 1915, as compared with \$638,580,300 in 1914. The 1915 value consisted of \$568,161,900 for grain crops, \$192,768,100 for fodder crops, and \$36,739,500 for potatoes and sugar beets. The 1915 grain crops included: wheat, valued at \$312,569,400; rye, \$1,899,900; barley, \$26,704,700; oats, \$176,894,700; corn for husking, \$10,243,000; mixed grains, \$10,034,700; peas, \$5,730,700; beans, \$2,206,800; buckwheat, \$5,913,000; flaxseed, \$15,965,000. Average prices per bushel in 1914 and 1915 respectively: wheat, \$1.22 and 83 cents; rye, 83 and 79 cents; barley, 62 and 50; oats, 48 and 34; peas, \$1.46 and \$1.66; beans, \$2.31 and \$3.05; corn for husking, 71 and 71 cents; flaxseed, \$1.03 and \$1.50; potatoes, 49 and 57 cents; turnips, etc., 27 and 26. Average prices per ton in 1914 and 1915: hay and clover, \$14.23 and \$14.22; fodder corn, \$4.91 and \$4.96; sugar beets, \$5.99 and \$5.50; alfalfa, \$14.17 and \$12.98.

The following table shows the area, in thousands of acres, and the yield, in thousands of bushels, of wheat, barley, oats, and flaxseed in

the Northwest Provinces (Manitoba, Saskatchewan, and Alberta), in 1914 and 1915:

		Wheat	Barley	Oats	Flaxseed
<b>Manitoba:</b>					
Acres	1914	2,616	468	1,381	40
	1915	3,342	490	1,441	84
Bushels	1914	38,605	9,828	31,951	388
	1915	96,425	17,763	69,471	374
<b>Saskatchewan:</b>					
Acres	1914	5,348	290	2,520	958
	1915	6,838	287	2,987	697
Bushels	1914	73,494	4,901	61,816	6,181
	1915	195,168	10,570	157,629	9,061
<b>Alberta:</b>					
Acres	1914	1,371	178	1,502	80
	1915	1,564	185	1,912	70
Bushels	1914	28,859	4,806	57,076	614
	1915	51,355	6,984	107,741	1,124
<b>Northwest Provinces:</b>					
Acres	1914	9,385	986	5,853	1,078
	1915	11,745	962	6,290	801
Bushels	1914	140,958	19,585	150,843	7,088
	1915	342,948	35,317	334,840	10,559

By provinces, the total areas and value of field crops in 1914 and 1915 were as follows:

	Acres		Value	
	1914	1915	1914	1915
Alta.	3,369,270	3,966,980	\$59,779,600	\$79,409,200
B. C.	260,640	292,880	11,463,000	11,625,700
Man.	4,671,790	5,529,550	65,528,400	119,447,000
N. B.	904,055	893,940	20,045,100	20,096,400
N. S.	693,860	727,260	21,969,700	19,556,700
Ont.	8,973,700	9,391,500	196,220,000	207,048,500
P. E. I.	461,510	481,985	11,544,000	10,982,700
P. Q.	4,863,850	4,901,760	99,279,000	104,688,000
Sask.	9,238,000	10,877,650	152,751,500	224,875,300
Can.	33,436,675	37,063,455	\$638,580,800	\$797,669,500

Estimated number of live stock on farms in Canada June 30, 1915, and June 30, 1916, respectively, with percentage of decrease or, in respect of cattle other than milch cows, of increase: Horses, 2,996,099 and 2,990,635 (0.2 per cent); milch cows, 2,666,846 and 2,603,345 (2.4); other cattle, 3,399,155 and 3,826,519 (12.6); sheep, 2,038,662 and 1,965,101 (3.6); swine, 3,111,900 and 2,814,672 (9.6). See AGRICULTURAL EXPERIMENT STATIONS; AGRICULTURAL LEGISLATION; DAIRYING.

**PUBLIC LANDS AND HOMESTEADS.** The crown lands of the Dominion are in the Northwest Provinces and in the railway belt of British Columbia. Of these lands large areas are offered in free grants as homesteads for settlers. The total number of acres surveyed to Jan. 1, 1916, was 198,937,027, of which 138,780,827 acres had been alienated from the crown and 60,156,200 acres remained for disposal; of the latter number, 4,015,300 acres were under timber licenses, 5,049,400 under grazing leases, 26,615,500 in forest reserves and parks, and 25,476,000 available for homestead entry.

The total sales of land held under government grant by the Hudson's Bay Company and by railways amounted to \$7,398,191 for 501,575 acres in the fiscal year 1914 and \$3,279,031 for 192,801 acres in 1915. In the two years respectively, the share of the Canadian Pacific Railway was \$4,242,089 and \$2,496,872.

In 1915, the total number of ordinary homestead entries for lands of the Dominion government was 17,532, as compared with 25,623 in 1914 and 31,499 in 1913. In 1915, 4113 entries were made in Manitoba (against 4252 in 1914), 6349 in Saskatchewan (against

9752), 6584 in Alberta (against 10,722), and 466 in British Columbia (against 847). The number of preëmptions under the Dominion Lands Act was 2210 in 1915 (1648 in Saskatchewan, 562 in Alberta), against 3262 in 1914 (2417 in Saskatchewan, 845 in Alberta). The number of purchased homesteads under the Act was 285 in 1915 (197 in Saskatchewan, 88 in Alberta), against 422 in 1914 (290 in Saskatchewan, 132 in Alberta).

Outside of the Northwest Provinces there are large areas of provincial public lands (except in Prince Edward Island, which is entirely settled); these lands are available for settlement in free grant or at low prices.

**FISHERIES.** The value, as officially reported, of all fish, fish products, and marine animals taken in both sea and inland fisheries was \$31,264,631 in the year 1914-15, as compared with \$33,207,748 in 1913-14. Value by provinces in 1913-14 and 1914-15 respectively, in thousands of dollars: Alberta, 81 and 87; British Columbia, 13,891 and 11,515; Manitoba, 606 and 849; New Brunswick, 4309 and 4940; Nova Scotia, 8298 and 7730; Ontario, 2675 and 2755; Prince Edward Island, 1280 and 1262; Quebec, 1850 and 1924; Saskatchewan, 149 and 132; Yukon, 68 and 70. To the total amount in 1914-15 the sea fisheries contributed \$27,198,257, and the inland fisheries \$4,066,374. Number of persons employed in the fishing industry in 1913-14, 96,669; in 1914-15, 94,513, of whom 84,108 in sea fisheries and 10,405 in inland fisheries.

**MINING.** According to the preliminary report of the Dominion Department of Mines, the total value of the mineral production in 1915 was \$138,513,750, as compared with the finally revised totals of \$128,863,075 in 1914 and \$145,634,812 in 1913. The figure for 1913 is the highest hitherto recorded. The cutting off of markets and the closing of metal exchanges after the outbreak of the great war in 1914 resulted in the closing down or restriction of operation at many properties. Recovery or readjustment came in the following year. According to an official statement, the demand in 1915 for copper, lead, nickel, and zinc "led to great activity in the operation of the already developed deposits of these metals, and also, later in the year, to the opening up of old and the exploitation of new deposits. The capacities of steel furnaces were taxed to the utmost to meet the demand for shell steel. Amongst non-metallic minerals the recovery of benzol and toluol in by-product coke oven operations was a direct result of the war, as was also the activity in the mining and shipment of magnesite and of chrome ores."

Value of the mineral production by provinces, with percentage of total (figures for 1915 subject to revision):

	1914	P.c.	1915	P.c.
Alta.	\$12,684,234	9.87	\$9,915,282	7.16
B. C.	24,164,039	18.80	26,932,658	20.89
Man.	2,413,489	1.88	1,351,604	0.97

\* From Canadian ore only.

COMMERCE. The following table shows, for fiscal years ending March 31st, the values in dollars of imports of dutiable merchandise, free merchandise, and coin and bullion, together with the values of the total imports:

	Merchandise		Coin & bullion	Total imports
	Dutiable	Free		
1910	241,961,556	143,873,547	6,017,589	391,852,692
1913	456,086,187	230,518,226	5,427,979	692,032,392
1914	425,324,576	210,186,916	15,235,805	650,746,797
1915	318,951,094	178,500,808	131,992,992	629,444,894
1916	310,193,014	220,052,580	34,260,202	564,505,796

The values in dollars of exports have been as follows, in fiscal years:

	Merchandise		Coin & bullion	Total exports
	Canadian	Foreign		
1910	279,247,551	19,516,442	2,594,536	301,358,529
1913	355,754,600	21,313,755	16,163,702	393,232,057
1914	431,588,439	23,848,785	23,560,704	478,997,928
1915	409,418,836	52,023,673	29,366,368	490,808,877
1916	741,610,638	37,689,432	103,572,432	882,872,502

Imports of merchandise for consumption, as compared with exports of Canadian merchandise, are shown below, for fiscal years:

	1913	1914	1915	1916
Imps.	670,089,066	618,457,144	455,446,312	507,917,159
Exps.	355,754,600	431,588,439	409,418,836	741,610,638

The principal imports for consumption, in the fiscal years 1915 and 1916 respectively, included the following, valued in thousands of dollars: Metals and minerals and manufactures thereof, 34,366 and 103,414 (of which iron and steel and manufactures thereof, 64,759 and 76,329); coal, coke, etc., 38,620 and 32,521; cotton and manufactures thereof, 27,399 and 32,470; wool and manufactures thereof, 24,830 and 32,371; sugar, molasses, etc., 19,033 and 22,735; drugs, dyes, chemicals, and medicines,

13,449 and 17,096; fruits, 15,469 and 14,330; oils, 13,345 and 13,943; hides and skins other than fur, 12,843 and 12,442; provisions, 5935 and 11,963; breadstuffs, 13,982 and 11,087; carriages, automobiles, etc., 8523 and 10,869; rubber and gutta-percha and manufactures thereof, 7767 and 9886; silk and manufactures thereof, 8139 and 8709; tea, 7364 and 8272; leather and manufactures thereof, 7059 and 6514; tobacco, 5801 and 5753.

The following table shows for fiscal years the exports of Canadian produce by great classes, values in thousands of dollars:

	1913	1914	1915	1916
Mining products...	57,443	59,039	51,741	66,590
Fisheries products...	16,337	20,624	19,687	22,378
Forest products...	43,255	42,792	42,651	51,271
Animal products...	44,785	53,349	74,391	102,882
Agricultural prod. ....	150,146	198,220	134,746	249,661
Manufactured prod. ....	43,693	57,443	85,540	242,035
Miscellaneous .....	97	121	664	6,793
<b>Total</b> .....	355,755	431,588	409,418	741,611

The table below shows, for fiscal years, the exports of Canadian wheat and oats, total grain, and wheat flour, quantities in thousands and values in thousands of dollars:

	1913	1914	1915	1916
Wheat, bu. ....	93,166	120,427	71,913	157,745
Wheat, \$ .....	88,609	117,719	74,294	172,896
Oats, bu. ....	10,479	34,997	17,769	26,816
Oats, \$ .....	5,068	13,380	8,961	14,638
Total grain, bu. ....	110,571	168,929	96,573	191,857
Total grain, \$ .....	97,941	138,129	88,018	192,827
Wheat flour, bu. ....	4,478	4,832	4,952	6,400
Wheat flour, \$ .....	19,971	20,581	24,611	35,767

Important exports of Canadian produce, in addition to those given above, were as follows in the fiscal years 1915 and 1916, values in thousands of dollars: gold, 15,407 and 16,870; silver, 13,516 and 14,298; copper, 7545 and 14,670; coal, 4466 and 6033; asbestos, 2227 and 2962; dry salted codfish, 4122 and 5418; canned salmon, 4949 and 6306; canned lobsters, 3014 and 2672; planks and boards, 18,921 and 23,880; deals, 7542 and 10,927; wood blocks for pulp, 6817 and 5744; wood pulp, 9266 and 10,377; shingles, 2988 and 3644; logs, 1259 and 1079; cattle, 9268 and 12,626; horses, 1842 and 4701; hides and skins other than fur, 7730 and 6759; furs, dressed and undressed, 2757 and 4778; bacon and hams, 14,465 and 27,090; cheese, 19,214 and 26,691; butter, 640 and 1019; fruits, 2657 and 1766; hay, 2233 and 5849; carriages, automobiles, etc., 3498 and 11,372; agricultural implements, 2802 and 3554; cotton manufactures, 507 and 1816; household effects, 3682 and 4222; iron and steel manufactures, 11,407 and 50,962; leather and manufactures thereof, 10,807 and 14,575; liquors, 1102 and 1432.

By principal countries, imports for consumption have been valued as follows for fiscal years, in thousands of dollars:

	1913	1914	1915	1916
United States .....	441,143	410,786	428,617	398,695
United Kingdom .....	138,749	132,071	90,161	80,075
France .....	15,380	14,277	8,449	5,949
Newfoundland .....	2,057	1,841	1,245	1,578
South America .....	10,529	9,020	9,594	12,730
West Indies .....	10,577	11,504	11,089	7,829
Germany .....	14,215	14,586	5,087	86
Belgium .....	4,020	4,490	1,876	59

Total exports by principal countries, for fiscal years, in thousands of dollars:

	1913	1914	1915	1916
United States .....	167,110	200,459	215,409	320,225
United Kingdom.....	177,932	222,823	211,759	463,081
France .....	2,565	3,811	14,596	36,086
Newfoundland .....	4,728	4,770	4,481	5,071
South America .....	4,352	4,026	2,114	5,093
West Indies .....	6,237	6,998	6,418	6,839
Germany .....	3,402	4,434	2,162	.....
Belgium .....	4,809	4,820	3,259	385

The two foregoing tables include coin and bullion. Imports of coin and bullion from the United States and exports thereto in the fiscal year 1914 were \$15,220,763 and \$23,511,074 respectively; in 1915, \$131,984,421 and \$29,066,470; in 1916, \$28,197,146 and \$103,555,818. These figures, as may be seen from the first two tables in this section, include most of the transfers of coin and bullion in the years mentioned.

**SHIPPING.** Vessels entered, including those employed in the coasting trade, numbered 140,597, of 72,667,084 tons, in the fiscal year 1914, and cleared 134,542, of 67,609,208 tons; in 1915, 132,304, of 65,357,422 tons, and 126,888, of 61,346,713 tons. The number of sea-going vessels entered in 1914 was 18,320, of 14,982,393 tons, and cleared, 17,695, of 14,586,093 tons; in 1915, 17,182, of 13,132,944 tons, and 16,730, of 12,269,642 tons.

**COMMUNICATIONS.** The length of railway in operation June 30, 1915, was 35,582 miles, the increase of 4788 miles during the year then ended being the largest hitherto recorded. In the fiscal year 1915, gross railway earnings were \$199,843,072 and working expenses \$147,731,099, the percentage of expenses as compared with earnings being 73.92, against 73.63 in 1914 and 70.90 in 1913. During the year ending June 30, 1915, the sum of \$66,990,127 was added to the capital liability of steam railways in operation; stocks increased \$2,977,412 and funded debt \$69,322,267, and there was a decrease in stock of \$5,300,552 due to an adjustment of capitalization by the Canadian Northern and subsidiary corporations. These changes brought the total capitalization of steam railways in operation to \$1,875,810,888 on June 30, 1915, as compared with \$1,808,820,761 in 1914. If the capitalization of railways under construction be added to that of the operating railways, the total is increased to \$1,957,292,392, of which \$877,058,601 stocks, \$176,284,882 consolidated debenture stock, and \$903,948,909 funded debt. See RAILWAYS.

The table below shows by provinces the mileage of steam railways in operation at the end of fiscal years:

	1910	1911	1912	1913	1914	1915
Ont. ....	8,230	8,322	8,546	9,000	9,255	10,702
P. Q. ....	3,795	3,882	3,882	3,986	4,043	4,677
Man. ....	3,221	3,466	3,520	3,993	4,076	4,498
Sask. ....	2,932	3,121	3,754	4,651	5,089	5,327

Yukon ....	91	102	103	102	102	102
In U. S. ....	.....	.....	.....	225	224	398
Total .....	24,731	25,400	26,727	29,304	30,795	35,582

Electric railways, computed as single track, had a total mileage of 2103 in 1915, as compared with 2052 in 1914.

Railway construction reached a low point in Canada in 1916 as the mileage constructed amounted to but 290 miles, as compared with 718 in 1915, and 1978 in 1914. Furthermore it was reported that the removal of tracks in service taking place in 1916 and to be continued, for shipment to France for use about the war front was actually decreasing the total of line operated. Aside from war conditions there undoubtedly had been for several years excessive railway construction in Canada so that there was in 1916 a much greater mileage in proportion to population than in any other country. As an additional consideration just previous to the war there had been business depression which also contributed to the necessary curtailment. The most important construction work of the year was the completion of the five-mile Connaught tunnel, while passenger stations were built by the Canadian Pacific at North Toronto and at Quebec and work was in progress on the Toronto union station. At Vancouver, B. C., the new passenger and freight terminal of the Vancouver, Victoria, and Eastern was being completed. The greatest amount of first track construction during the year was on the Edmonton, Dunvegan, and British Columbia, involving 21 miles on the main line, 50 miles on the Edmonton Dunvegan, Grand Prairie branch, 40 miles on the Alberta Great Waterways, and 5 miles on the Central Canada, Peace River branch. On the Hudson Bay Railway 96 miles were completed in Manitoba, and on the Pacific Great Eastern 37 miles were built from Clinton, B. C., to Horse Lake Summit. The Canadian Government Railways had their new terminal facilities at Halifax 85 per cent completed at the end of the year, and a substantial beginning had been made on the new grain elevator and tracks at St. John, on the Prince Edward Island car ferry and terminals and on the grain elevator at Transana. On the Canadian Northern (Western Lines) considerable construction was under way in Alberta, while on other lines minor construction, replacements, or improvements were under way.

It was announced late in 1916 that the British government had requested the railways of Canada to supply 1200 to 1500 miles of track, including rails and other track material for immediate use in France. The transportation facilities behind the western front were not proving adequate to permit the Allies to take full advantage of the munitions and other supplies available.

By December 300 miles of Canadian government railways' sidings had been taken up to be shipped. Next were to follow the taking up of 220 miles of track in the mountain section between Edmonton, Alberta, and the coast, where in some places the Canadian Northern and Grand Trunk Pacific are nearly parallel.

The Canadian telegraph systems include lines owned and operated by the Dominion government and lines owned and operated by railway and telegraph chartered companies. The government lines on March 31, 1915, had a total length of 11,497 miles, with 870 offices. On June 30, 1915, the Canadian Pacific Railway had 14,633 miles of line, 106,066 miles of wire; Grand Trunk Pacific Telegraph Co., 4639 and 13,229; Western Union, 2581 and 12,879; National Transcontinental Railway, 1990 and

4834; Great Northwestern Telegraph Co. (in 1914), 9563 and 30,134; Canadian Northern Railway (in 1914), 5924 and 18,233. In 1915, the government maintained 59 radiotelegraph stations. Miles of telephone wire in 1915, 1,452,360.

**FINANCE.** The Canadian monetary unit is the dollar, equivalent to the American dollar; the standard of value is gold. The system of public finance includes a consolidated fund and miscellaneous accounts. To the consolidated fund are paid in the revenues, and out of it are paid the expenditures, properly relating to the fiscal year. The miscellaneous accounts comprehend loans, debt redemption, railway administration, capital expenditure on public works, etc. The revenue and the expenditure of the Dominion government are shown in the table below for fiscal years. The several items are indicated as follows: *a* expenditure chargeable to consolidated fund; *b* expenditure chargeable to capital; *c* railway subsidies; *d* other charges; *e* total disbursements; *f* revenue on account of consolidated fund; *g* other revenues; *h* total revenue; *i* difference between receipts and disbursements; *j* sinking funds; *k* net difference between receipts and disbursements.

	1912	1913	1914	1915
	\$	\$	\$	\$
a	98,161,441	112,059,537	127,384,473	135,523,207

k	*122,591	*25,617,835	†21,695,234	†118,379,232

\* Net excess of receipts. † Net excess of expenditure.  
‡ Including expenditure on account of war appropriation \$80,750,476.

In the fiscal years 1914 and 1915 respectively, receipts from customs were \$104,691,238 and \$75,941,220; excise, \$21,452,037 and \$21,479,731; post office, \$12,954,530 and \$13,046,665; railways, \$13,394,317 and \$12,149,357; miscellaneous, \$10,682,272 and \$10,456,509; total, \$163,174,395 and \$133,073,482. Expenditure chargeable to consolidated fund has been as follows, in fiscal years:

	1913	1914	1915
Debt charges *	\$14,493,155	\$14,752,117	\$17,937,284
Prov. subsidies	13,211,800	11,280,469	11,451,678
Civil gov't.	5,109,459	5,607,795	6,157,967
Public works	18,468,505	19,007,518	19,843,582
Defense	9,114,533	11,151,399	10,060,618
Rev. collection	33,006,201	39,084,657	42,232,953
Other	23,655,384	26,500,524	28,339,180
Total	\$112,059,537	\$127,384,473	\$135,523,207

\* Interest on the public debt amounted to \$12,605,882 in the fiscal year 1913, \$12,893,505 in 1914, and \$15,736,743 in 1915.

The public debt on March 31, 1915, was \$700,473,812; assets, \$251,097,731; net debt, \$449,376,083, as compared with \$335,996,850 in 1914. See FINANCIAL REVIEW.

**ARMY.** The recruitment of volunteers for the Canadian forces continued during 1916 and in the speech from the throne at the close of Parliament on May 18th it was stated that in the first four months of the year more recruits had offered themselves than in any other similar period of the war. At that time it was stated that nearly 170,000 Canadians had gone overseas and that more than 140,000 were under training in Canada. On September 6th there were under arms 361,693 Canadians, enlistments having been: May, 15,090; June, 10,796; July, 8675; August, 7246. Up to this time the killed, wounded, and missing had amounted to 30,000. There had been a total of 250,000 men trained and sent abroad and 400 munitions factories had been established from which an output valued at \$30,000,000 monthly was forthcoming. There were maintained numerous training camps for the volunteers, the largest of which was Camp Borden in Ontario, and the men sent to the front in Europe were distinguishing themselves. The method of training had proved most effective and the response generally loyal.

**NAVY.** The only ships of fighting value are the cruisers *Niobe* (11,000 tons) and *Rainbow* (3000), and two submarines. Soon after the outbreak of the great war they were placed at the disposal of the British government.

**GOVERNMENT.** The executive power is exercised in the name of the King of Great Britain and Ireland by a governor-general, who is appointed by the crown and who acts through a privy council, or responsible ministry. The legislative power devolves upon a parliament of two Houses, the Senate and the House of Commons. The duration of a parliament is five years. The 12th Parliament opened Nov. 15, 1911, but by Act of the British Parliament June 1, 1916, the duration of the Canadian Parliament was extended until Oct. 7, 1917. Senators, nominated for life by the Governor-General, are 87 in number; in the 13th Parliament, they will number 93. Members of the House of Commons numbered 221 in 1916; they are elected by direct vote for the duration of Parliament. In the 13th Parliament, they will number 234, apportioned as follows: Quebec, 65; Ontario, 82; Nova Scotia, 16; New Brunswick, 11; Prince Edward Island, 3; Manitoba, 15; Saskatchewan, 16; Alberta, 12; British Columbia, 13; Yukon Territory, 1.

On Aug. 19, 1916, the Duke of Devonshire (q.v.) was appointed to succeed Prince Arthur, Duke of Connaught, as Governor-General. The Duke of Connaught was appointed March 21, 1911, and assumed office October 31st of that year. The Conservative ministry of Sir Robert Laird Borden, which succeeded the Liberal ministry of Sir Wilfrid Laurier Oct. 10, 1911, was composed as follows in 1916 (dates of appointment are here given only in the case of members who entered the ministry after Oct. 10, 1911): Premier and president of the privy council, Sir Robert Laird Borden; minister of trade and commerce, Sir George Eulas Foster; interior, William James Roche (Oct. 29, 1912); public works, Robert Rogers (Oct. 29, 1912); railways and canals, Francis Cochrane; finance, Sir William Thomas White; postmaster-general, Thomas Chase Casgrain (Oct. 20, 1914); minister of marine and fisheries, John Douglas Hazen (also minister

of the naval service); justice, Charles Joseph Doherty; militia and defense, Lieut.-Gen. Sir Sam Hughes; secretary of state, Pierre Edouard Blondin (Oct. 20, 1914) — he was also minister of mines; minister of labor, Thomas Wilson Crothers; inland revenue, Esioff Léon Patenaude (Oct. 6, 1915); customs, Dr. John Dowsley Reid; agriculture, Martin Burrell; ministers without portfolio, Sir George Halsey Perley, Albert Edward Kemp, Sir James Alexander Lougheed;—not in the cabinet: solicitor-general, Arthur Meighen (June 26, 1913); parliamentary secretary of militia and defense, Fleming B. McCurdy (July 19, 1916); parliamentary under secretary of state for external affairs, Lieut.-Col. Hugh Clark (Oct. 21, 1916).

Each of the provinces has an elected legislature, and an executive (lieutenant-governor), who is appointed by the Governor-General and acts through a responsible ministry.

### HISTORY

**PARLIAMENT.** In his New Year message, the Premier, Sir Robert Borden, declared that Canada's overseas forces must be increased to 500,000. On February 8th the Canadian House of Commons petitioned the British Parliament for the amendment of the Constitution of Canada known as the British North America Act, extending the present Dominion Parliament for one year. This action was taken on account of the objection to holding an election in war time. On February 15th Sir William Thomas White, minister of finance, introduced the war budget which included a new tax of 25 per cent on war profits. The yield of this and the other new taxes was estimated at \$50,000,000. He announced that in spite of them the ordinary revenues were still so inadequate that a domestic loan would be necessary in order to meet the war expenditure which was estimated at \$250,000,000.

**RECRUITING.** Although under the voluntary system, Canada supplied a remarkably large quota to the armies at the front in proportion to her population. In the summer it was estimated that 350,000 men had been enrolled mainly from the English-speaking population of 4,500,000. Recruiting slackened somewhat in the summer time on account of the demand for labor for the harvest and the industries connected with war supplies. It was estimated at that time that about 200,000 men were employed in the production of munitions; that the government and the banks acting jointly had provided \$150,000,000 for the production of munitions and that contracts amounting to \$400,000,000 had been placed with Canadian companies. Statistics of recruiting in rural communities showed that from 60 to 65 per cent of the men were born in Canada. As to the distribution among the provinces, Ontario in the summer time had contributed 145,195, Quebec 36,890, the four western provinces 136,939, and the three eastern provinces 31,633. It was evident, although there were no statistics to prove it, that labor, organized and unorganized, was supplying its full share. The attitude of the working class generally was loyal to the government and there had been few labor difficulties since the beginning of the war. In one instance, namely, that of the railway organizations, the

men refused to press demands for higher pay upon the companies until after the end of the war. After the prorogation of Parliament, Sir Wilfrid Laurier addressed strong appeals to the French population of Quebec on behalf of enlistment. As the need of greater numbers at the front became evident and the total casualties of Canadian troops were reported at about 50,000, there was talk of compulsory military service, especially among those who had lost relatives in battle. There was an increase in the feeling that the voluntary system was working out unfairly in view of its pressure upon the English-speaking population and it was pointed out that if it proceeded in the same proportion recruiting an army of 500,000 would draw at least 450,000 from the English inhabitants. In the closing months of the year the Prime Minister who had set the figure of 500,000 as the proper quota for the Dominion, issued an appeal in which he pointed out that during the last few months enlistments had decreased and urged all who were fit for military duty to place themselves freely at the disposal of the government. At that time he said more than 370,000 men had enlisted in the Dominion and of these 258,000 had gone overseas. Repeated appeals were addressed not only by Sir Wilfrid Laurier but also by French members of the government to the French-Canadian population in Quebec in order to induce them to enlist, but their indifference and the deterrent effect of Mr. Bourassa's speeches prevented much from being accomplished. As illustrating Mr. Bourassa's attitude, the following passage may be cited: "Here in Canada there is being forged around our necks a militarism unparalleled in any civilized country, a depraved and undisciplined soldiery, an armed rowdiness without faith or law and as refractory to the influence of individual honor as to that of their officers."

The following figures were given as showing the small proportion of enlistments among the native French: "Total enlistments for Quebec 36,000, of which 23,000 were from English speaking natives; while the French population numbers 1,605,339 and the British 316,103."

**POLITICAL DISCUSSION.** The arguments of Liberal leaders like Sir Wilfrid Laurier and the Hon. Rodolphe Lemieux implied the existence of a movement on the part of jingoes to subordinate the interests of Canada to the Imperial government. It was alleged that in England there was a movement to reconstitute the Empire, not on the old lines of liberty, but on the basis of German militarism. Sir Wilfrid saw evidence of an extreme militarist policy and declared that it would be most unfortunate if as a result of a war undertaken to save civilization from militarism, the conquering nations should saddle themselves with militarism. On the other hand, he urged the greatest possible vigor in the prosecution of the war and appealed for recruits. The government did not address itself during the year to these criticisms, apparently taking the stand that union between the parties was essential and that the government ministers ought not to take part in controversies.

**INTERNAL CONDITIONS.** The crop of 1915 had been extremely large and this fact along with the great profits from the placing of orders amounting to \$500,000,000 or \$600,000,000 in

CANADA

connection with war materials led to something like a state of artificial prosperity. Personal expenditures which had been restricted at the beginning of the war now seemed to increase again, and it was reported that among the working classes there was less of a tendency to economize even than before the war. Canada's trade for the year ending June 30, 1916, was placed at about \$1,600,000,000, that is, more than \$250 per head of the entire population. It was reported that workmen were more fully employed than usual and that to some extent women were taking the place of the men who were at the front, but they had not entered into industry to any such extent as in Great Britain or in France. Liberal pensions accounted in part for this fact. Since the beginning of the war there had been five war loans, of which two occurred in 1916, namely: In March the loan placed in New York for \$75,000,000, and in September the domestic loan of \$100,000,000. The total from the beginning of the war was \$345,000,000. The liabilities of Canada to the Imperial government on June 30, 1916, were placed at \$162,000,000 against which \$50,000,000, raised from the loan, was placed as a credit, thus reducing the total to \$112,000,000. Each of the loans was very successful and the one for September, 1916, received applications for more than double the amount. For the domestic loans the banks underwrote a large proportion of the amount. The banks aided the government very materially in its credits to the Imperial Munitions Board, which credits in 1916 were as follows: April, \$76,000,000; July, \$24,000,000; November, \$25,000,000; December, \$25,000,000.

**THE LANGUAGE QUESTION.** The discontent of the French-Canadian element appeared again in February, as a result of regulations in the Province of Ontario, restricting the use of the two languages in the schools. The French-Canadian priests in the province united in an effort to prevent recruiting among their parishioners. Three thousand French citizens of Ottawa resolved to pay no taxes until their grievances were redressed. A general trade boycott on behalf of French rights was resolved upon and in some quarters threats of violence were made. The situation became more serious in May, when Sir Wilfrid Laurier, who had hitherto stood firmly against racial division in politics, came out on behalf of the two-language policy, thus dividing the Liberal party along race lines. In the Province of Quebec the Liberals and Nationalists joined hands against the Conservatives, who held to the principle of provincial autonomy as to language. The feeling of the French-Canadians had the effect of virtually stopping enlistment among them. The proportion of the native French in the Canadian army was as noted above only a small fraction of the total number who had enlisted, although they were more than a quarter of the total population. The bi-lingual difficulty arose from the regulation that required English to be taught in French or bi-lingual schools from the beginning of the course, and to be employed as the language of instruction after the first two years. French, however, might be retained as the language of instruction after the two years, if in the judgment of the authorities, circumstances required it, and it was always to be a compulsory subject. A resolution was introduced

in the Dominion House of Commons on behalf of the French-Canadians in Ontario, but failed to pass. It was warmly supported by Sir Wilfrid Laurier, but was opposed by the Prime Minister on constitutional grounds. The purport of it was that during this time of difficulty when the thoughts of every one should be on the winning of the war, the House of Commons, while fully recognizing the principle of provincial rights and acknowledging that every child should have a thorough education, would respectfully suggest to the Legislative Assembly at Ontario "the wisdom of making it clear that the privilege of the children of French parentage being taught in their mother tongue, be not interfered with." The resolution was defeated by the vote of 107 to 60.

**PROVINCIAL ELECTIONS.** In Quebec, Nova Scotia, and British Columbia new legislatures were elected and in each province the Conservative party was decisively defeated. In Quebec only 7 out of 85 members were returned, in Nova Scotia only 11 out of 33. In Quebec Mr. Bourassa and the Nationalists joined with the Liberals. The election followed soon after the debate over the language question in Ontario. In British Columbia the returns showed 36 Liberalists to 10 Conservatives and one Socialist. Charges of extravagance had been brought against the administration of Mr. Bowser. Both under his administration and that of his predecessor, Sir Richard McBride, there had been charges that the railways and the public domain in general had been dealt with in an improvident manner. There had been great speculative activity down to the beginning of the war and the collapse of the government followed the end of this period of inflation. The new Premier was Mr. H. C. Brewster. In Saskatchewan the Premier, Hon. Walter Scott, resigned on account of illness, and was succeeded by Hon. W. M. Martin, of Regina. In the latter part of the Scott ministry charges had been made and later established before royal commissions, of thieving on the part of officials who had charge of the appropriations for railway building and of bribes paid to the members of the Legislature by liquor dealers. The result was the imprisonment of three or four members of the Legislature and the resignation of the Speaker. The members of the government, however, were acquitted of any knowledge of these proceedings.

**COMMERCIAL RELATIONS WITH FRANCE.** A commercial mission was sent to France in order to devise means of improving trade between the two countries, and in general to promote closer commercial relations after the war. No two countries, it was argued, were better fitted to trade in each other's products in large quantities of commodities that did not come into competition. It was pointed out that before the war trade between Canada and France had been comparatively small. In 1913-14, for example, the exports to France amounted to only \$3,810,562, which was about 2 per cent of the exports to the United Kingdom in that year. The imports from France during the same period amounted to \$14,404,276. It was held that Canadian producers and manufacturers had not made a serious effort to supply the French market with important Canadian products such as wood, cereals, fish, and cheese, and that French purchasers seemed unaware of the Cana-

dian supply of important raw materials. France purchased some of these products in large quantities from other countries. In 1913 France had expended 11,000,000,000 francs on imports of commodities in whose production Canada had especial advantages. A large quantity of French paper, for example, was made from German or Austrian wood pulp, although Canada was rich in both these products. It was the purpose of the mission to make these conditions known in France for it was believed that the insignificance of the commerce between the two countries was due largely to the ignorance of purchasers in each.

**CHARGES OF GRAFT.** Sir Rodmond Roblin, former Premier of Manitoba, together with two members of his cabinet and Thomas Kelly, a contractor, were indicted by the Grand Jury in Winnipeg on charges which included conspiracy to defraud and an attempt to corrupt witnesses. The Premier was also charged with the destruction of public documents and the contractor with perjury and theft. The latter was found guilty on June 29th, but sentence was suspended during the application for a new trial. It was charged in Parliament that middlemen had gained excessive profits through the awards of contracts by the Canadian Shell Committee, and on March 30th, the government announced that a Royal Commission of inquiry would be appointed to investigate the suspected contracts. The commission, consisting of Sir William Meredith of Toronto, and Justice Duff of the Federal Supreme Court, began its inquiry on April 26th. The charge had been made that Lieut.-Gen. Sir Sam Hughes, minister of militia, had been dishonorably involved. He had presented his defense before Parliament on April 18th, disavowing absolutely any such relation and demanding a full inquiry. The commission investigated the charge in general that contracts were awarded to American firms for improper reasons. These awards were explained by the Ordnance Adviser of the Imperial Munitions Board, as due to, in his opinion, first, that Canadian companies were incompetent and could not deliver the supplies in time, and, second, that the matter demanded haste. It was acknowledged that the American firms had not been worthy of his confidence in the matter of delivering the supplies on time. The commission then took up the question of graft in connection with the awards. The counsel for General Hughes presented evidence that he had been entirely free from complicity in "rake offs," and on July 21st the commission declared him innocent of any improper relation to the contracts in question. It criticised Col. J. Wesley Allison, but held that he had no intention of receiving remuneration.

**MISCELLANEOUS.** The Parliament buildings in Ottawa were destroyed by fire on February 3rd. The fire was supposed to have been the work of an incendiary and was attributed by many Canadians to the German sympathizers, but the commission appointed to investigate reported that there was no positive evidence of crime. On February 4th attempts were made to destroy Victoria Bridge at Montreal. On March 7th, Charles Respa, charged with dynamiting the factory at Walkerville and endeavoring to blow up the armory at Windsor, was sentenced to life imprisonment at Sandwich, Ont. Early in the year a law to es-

tablish woman suffrage was passed in Manitoba. A woman suffrage measure was passed also in Alberta and it was announced in Saskatchewan that a similar measure would be introduced. In Manitoba the law to abolish the retail liquor trade was passed. In Newfoundland a vote carried complete prohibition, which was to take effect on January 1, 1917. In British Columbia a plebiscite was held on the question of the liquor traffic, and the result was heavily for prohibition. In the spring the Ontario Legislature passed a law closing all bars and liquor shops in the province and the law came into effect on September 16th. Under its terms liquor could be sold only for certain specified purposes and only under very strict government direction. See CITY PLANNING; EXPLORATION.

**CANALS.** The reopening of the Panama Canal and the successful efforts to deal with the troublesome slides that interfered with its use in 1915 may perhaps be considered closing chapters in that great work and are discussed under that title. (See PANAMA CANAL.) The next work of magnitude was the enlargement of the Welland Canal in Canada between Lake Ontario and Lake Erie, amounting to almost an entire reconstruction and partial relocation, while the completion of the New York State Barge Canal was almost reached. These two projects and others are discussed in the accompanying paragraphs but in the main there was little interest manifested during the year in canal projects, either in Europe or America. The system of canals in Belgium had served that country for defense as it made possible the inundation of large regions, and additional waterways were suggested for construction after the war.

**NEW YORK BARGE CANAL.** At the end of 1916 less than 10 per cent of actual construction remained on the New York State Barge Canal, and the work still undone was not so much excavation or placing concrete as it was the organization of the operating force, the manipulation of the lock gates and valves, maintenance of water supply and reservoirs, generation of electric power, and the creation of terminals and freight handling facilities along the route of the canal and the contributing waterways. In the season of 1916, 83 miles of the Erie section of the canal at the eastern end were completed and open for navigation as were about 97 miles eastward from Buffalo, including sections from Newark to Pittsford and from South Greece to Tonawanda. Unfinished work at the mouth of Tonawanda Creek, the section south of Rochester, the section from Lyons to Clyde, and four miles from Utica to Sterling Creek were the only parts that prevented the full use of the canal. During the year the State Engineer had solved the last big engineering problems, chief of which were the Rochester and Syracuse harbors, the Irondequoit crossing, the Tonawanda movable bridges, 20 disputed railway crossings, and the Clyde River location, all of which were put under contract. The opening of the full barge canal system was looked for in 1918.

**LAKE WASHINGTON CANAL.** Progress continued on this short but important waterway at Seattle, Wash., so that it was thought it could be opened for traffic in 1917 or 1918. On July 12th the mammoth gates dividing the

fresh water of Salmon Bay from the salt water of Shilsole Bay were closed, so that Salmon Bay above the locks could be filled to the level of Lake Union, the water being raised about 30 feet above the previous level at low tide. In the following month the large concrete lock at the entrance to Salmon Bay was formally opened for traffic by Lieut.-Col. J. B. Cavanaugh, U. S. A., engineer in charge. This main lock is of concrete, 825 feet long, 80 feet wide, and at the Salmon Bay end opens into a channel 36 feet deep. The walls of the lock are 55 feet thick at the bottom, 8 feet thick at the top, and 55 feet high. When the lock is emptied and the water brought down to the mean level of Puget Sound the water inclosed by its walls has a depth of 36 feet; when it is full, or raised to the level of Salmon Bay, the water has a depth of nearly 50 feet. Only eight minutes are required to empty or fill the big basin. At high tide there is only 8 or 9 feet difference between the level of the salt water in the outer channel and that of the fresh water basin at Salmon Bay. In addition to the main lock there is a small lock alongside the large basin 150 feet long and 30 feet wide, which can take vessels of 16-foot draft. Naturally its gates are much lighter than those of the big basin, and it is designed for the rapid lockage of small craft.

The actual completion of the canal was more or less complicated by the Seattle bridge situation which interfered somewhat with the remainder of the dredging operations. In October the Fifteenth Avenue Bridge at Salmon Bay was 85 per cent finished and was to be completed by the following April. The Fremont Bridge was 90 per cent completed and was expected to be ready early in 1917. The Latona Bridge across Lake Union was delayed by reason of certain technical investigations concerning the foundations. However, if the work was executed according to the contract the Latona Bridge would not be finished before Jan. 1, 1918, and would therefore seriously affect the date on which navigation might be inaugurated between Lake Union and Lake Washington. The work of constructing this new canal was begun on Nov. 10, 1911, and up to 1916 Congress had appropriated for it \$2,275,000, while to this amount \$1,000,000 was added by the State of Washington and King County. It has been described in earlier issues of the YEAR BOOK and a technical description may be found in *Engineering Record* for July 31, 1915.

**CANALS AT SAULT STE. MARIE.** The lake commerce passing through the canals at Sault Ste. Marie, Michigan, and Ontario, showed a substantial gain in 1916 over the previous year and a record for traffic in the history of these busy waterways. At the United States canal the masonry work on the new fourth lock was about one-half completed on December 31st, but no work had then been started on the gates or machinery. The season of 1916 for the United States canal, 244 days, opened April 20th, and closed December 19th, while the Canadian canal was open from April 18th to December 18th, 245 days. In this time 25,407 vessels with a registered net tonnage of 69,824,463, passed through both canals, 18,716 using the United States canal and 6691 the Canadian, the registered tonnage being 57,038,207 for the American and 12,786,256 for the Canadian. This was an

increase of 4174 vessels, or 20 per cent, over the total traffic for 1915 when 21,233 vessels with a total tonnage of 56,399,147 passed through. The total freight in 1916 was 91,888,219 short tons as compared with 71,290,304 in 1915. The most important items as usual were iron ore, of which 63,423,180 tons passed through the canals, and wheat, of which there were 226,063,315 bushels, a decrease of 29,418,243 bushels from 1915.

**ABANDONED CANALS IN THE UNITED STATES.** Canal transportation in the United States, while often serving useful purposes for a time, in many cases has grown obsolete or inadequate and the canals have been abandoned. In cities they became quite often as obnoxious as open sewers, or occupied valuable space in busy areas. Accordingly there was developed a tendency in several cities, after draining, to use the deep cuts of the canals for rapid transit or railways. Thus in Cincinnati the proposed interurban entrance was located on the Miami and Erie Canal. In Syracuse it was thought that the old Erie Canal bed would certainly in time become the route of the New York Central through the city and replace the tracks which were for years a most disgraceful example of municipal disfigurement. In Rochester, with the turning of the Erie Canal into new channels, the use of its bed for a street railway route there would be made possible. In several other communities containing abandoned canals in their limits, the combined advantages of ridding the city of a nuisance and of obtaining ready made a depressed railway terminal or rapid transit route were being seriously canvassed.

**WELLAND CANAL.** Active work on this vast enterprise was in progress in 1916 though the war and the scarcity of labor in Canada interfered with its most vigorous prosecution. The lock construction involving structures from 800 to 2500 feet in length unquestionably rivaled that of Panama, while the entire canal was laid out as a single piece of work, although actually divided into nine distinct contracts ranging up to \$10,000,000 each in cost. The rock excavated on one of the sections is crushed and used for aggregate for most of the large structures which are located at the north end of the canal. This stone is distributed as well as the spoil from the steam shovel excavation by a double track stone ballasted railway along the west side of the canal. Considerable use was being made of traveling rehoisting towers for placing the concrete and advantages were claimed over handling large buckets of concrete with cranes and derricks and over direct chuting from a central plant. The canal was being built under the charge of the Department of Railways and Canals of the Canadian government with J. L. Weller engineer in charge of the work. The general work and methods are discussed in *Engineering Record* for Oct. 21, 1916.

**MARSEILLES-RHÔNE CANAL.** Notwithstanding the war, progress continued on this important waterway with its notable tunnel. (See TUNNELS.) One of the three opening galleries of the Rove tunnel was completed the entire length (23,622 feet). The portion above the tow-path was finished on half of the length. The canal ditch in the tunnel had not been begun. Between Marseilles and Port-de-Bouc the breakwaters in the Mediterranean and in the Etang de Berre were almost completed, while between

Port-de-Bouc and Arles, the work begun before the war was being continued. The locks at Arles on the Rhône were built. The total cost of the canal was estimated at \$17,755,000, including \$10,815,000 for the Rove tunnel and its approaches.

**GERMAN CANALS.** In the early part of 1916 the Mittelland (Rhine-Elbe) Canal Commission held a very largely attended meeting at Berlin to discuss the continuation of the canal from the Weser and Hanover farther east to the Elbe, two routes being considered: The northerly route would run almost straight east to Heinrichsberg on the Elbe below Magdeburg; the southerly route would reach Magdeburg via Peine, Braunschweig, and Oschersleben. The northerly canal would have a length of 89 miles and few locks, and would cost some \$25,000,000, while the southerly canal would be 107 miles in length and would cost nearly \$35,000,000, but it possessed the advantage of traversing important industrial districts and would be nearer water-feeders from the Harz Mountains. A third suggestion was to place the terminal farther south on the Elbe above Magdeburg. The new canal would be designed for through traffic, especially if in any case branch canals would be constructed. It is interesting to note that the northerly route was considered less exposed to aerial attacks. No decision was reached as to which route would be selected, but an early construction of the canal was urged upon the government.

**CANARY ISLANDS.** A group of islands off the northwest coast of Africa; a province of Spain. Area, 7273 square kilometers (2808 square miles). The census of Dec. 31, 1910, returned a population of 444,016; estimate of Dec. 31, 1913, 460,768. The capital, Santa Cruz de Tenerife, had 63,004 inhabitants in 1910; Las Palmas, the most important town, had 60,338. See **AGRICULTURE**.

**CANCER.** What appears to be important evidence in favor of the parasitic origin of cancer is being developed by E. F. Smith of the Laboratory of Plant Pathology of the United States Department of Agriculture, who has, for a number of years, been studying a growth occurring in many plants and known as "crown-gall." This is a vegetable tumor which is in many of its characteristics analogous to cancer in man. The points of similarity which have been brought out by Smith are the vegetative or embryonic character of the cells, rapidity of growth, lack of capsule and infiltration of surrounding tissue, a tendency to central degeneration, liability to recurrence after removal, cachexia, and the tendency to develop metastases. An organism has been found and isolated, named the *Bacterium tumefaciens*, which fulfills Koch's postulates for a specific organism. Growths similar to the tumor from which the bacterium was derived have been produced by inoculation, but even more interesting experiments appear to indicate that tumors resembling sarcoma, carcinoma, epithelioma, teratoma, and mixed tumors can be produced by the same organism, according to the part of the plant and the age of the plant inoculated. When the bacterium is introduced into the connective tissue of young, well nourished, actively growing plants, sarcoma results. Carcinoma and epithelioma develop when epithelial tissue is inoculated. When inoculation is made in

the vicinity of growing buds embryomata or teratomata are produced, containing all the primary germ layers, which become scattered and separated into fragments, which are distributed in the new growth where they develop abortively. Smith explains the action of the organism thus: "The micro-organism, entering the cells as the result of slight wounds, grows rapidly for a short time. Its growth is then inhibited apparently by its own by-products. As the result of this inhibition many of the bacterial rods swell, becoming clumpy and variably branched, giving rise to the so-called Y bodies. There then ensues death for many, and a dormant period for the remainder. The organisms which are killed outright by the by-products evolved during their previous growth in the cells, are the ones which now stimulate the nucleus to development. This I conceive to take place by endotoxins or other substances. As soon as the nucleus begins to divide, its membrane disappears, and its contents flow into the cells, the benumbed bacteria take on new growth, and pass over into the daughter cells, where the process is repeated."

Probably the most interesting feature of this investigation is the possibility it suggests that the several varieties of malignant tumors in man may have a common origin.

**CANNON, JAMES GRAHAM.** An American banker, died at Golden's Bridge, N. Y., July 5, 1916. He was born at Delhi, N. Y., in 1858, and at 18 became a messenger in the Fourth National Bank of New York City. With this institution he was connected for almost 40 years (for 20 years as vice-president), retiring finally as its president, an office to which he was elected in 1910. Mr. Cannon helped to organize, and was president of, the National Association of Credit Men. He devoted much attention to the subject of clearing houses, his work called *Clearing Houses—Their History, Methods, and Administration* being the chief authority in its field. He advocated the use of the Clearing House Association of the country as a basis for the issue of an elastic currency, when necessitated by trade conditions, and proposed that clearing houses be incorporated. Besides his interest in the Fourth National Bank, Mr. Cannon was an officer or director of numerous other banks and also of manufacturing concerns. He identified himself prominently with the New York Chamber of Commerce, with movements for civic and suburban improvement, and with various philanthropies and educational institutions. A member of the National Committee of the Y. M. C. A., he stood back of evangelistic campaigns conducted by this organization in 1910, in 90 large cities and in rural districts.

**CAPE COLONY.** Formerly the popular name of the Cape of Good Hope Colony, which, as Cape of Good Hope Province, became an original part of the Union of South Africa, May 31, 1910. See **SOUTH AFRICA, UNION OF**.

**CAPE OF GOOD HOPE PROVINCE.** An original province of the Union of South Africa. (See **SOUTH AFRICA, UNION OF**.) Capetown, the capital, had, with suburbs, at the last census, 161,579 inhabitants (municipality, 67,159).

**CAPE-TO-CAIRO RAILWAY.** See **CONGO, BELGIAN**.

**CAPE VERDE ISLANDS.** A group of Portuguese West African islands, having a total area of 1516 square miles. Population (1912), 143,929. Capital, Praia.

**CAPPER, ARTHUR.** Reflected Republican Governor of Kansas Nov. 7, 1916.

**CARBIDE.** See CHEMISTRY; INDUSTRIAL.

**CARDINALS, NEW.** See ROMAN CATHOLIC CHURCH.

**CARINTHIA.** A crownland of Austria. See AUSTRIA-HUNGARY.

**CARLISLE INDIAN SCHOOL.** See INDIAN TRAINING AND INDUSTRIAL SCHOOL.

**CARLSTROM, VICTOR.** See AERONAUTICS.

**CARMEN SYLVA.** See ELIZABETH, DOWAGER QUEEN OF RUMANIA.

**CARNEGIE, VOYAGES OF THE.** See EXPLORATION, *Miscellaneous*.

**CARNEGIE ENDOWMENT FOR INTERNATIONAL PEACE.** See INTERNATIONAL PEACE AND ARBITRATION.

**CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING.** See UNIVERSITIES AND COLLEGES, section so entitled.

**CARNEGIE GEOPHYSICAL LABORATORY.** See CHEMISTRY, GENERAL; MINERALOGY.

**CARNEGIE INSTITUTE OF TECHNOLOGY.** A non-sectarian institution for the technical education of men. It was founded by Andrew Carnegie at Pittsburgh, in 1909. The institute comprises schools of Applied Design, Applied Science, and Applied Industries, and the Margaret Morrison Carnegie School. In the fall of 1916 the total enrollment of students was 3628. The faculty numbered 233. For the fiscal year ending March 30th the endowment was \$9,150,000, and in 1915-16 the income was \$672,203. At the end of the year construction work was about to begin on a new \$300,000 building for the School of Applied Science, to house the executive offices and library of the Engineering School and the departments of Machine Construction and Commercial Engineering. The library contains 350,000 volumes. President, Arthur A. Hamerschlag. See also PAINTING AND SCULPTURE.

**CARNEGIE INSTITUTION OF WASHINGTON.** The fifteenth annual report of the president of the Institution, Robert S. Woodward, covers the fiscal year ending Oct. 31, 1916. It considers in a general way the accomplishments of the Institution in its various departments: botanical research, economics and sociology, embryology, experimental evolution, historical research, marine biology, meridian astronomy, terrestrial magnetism, geophysical laboratory, nutrition laboratory, division of publication, and solar observatory. Total receipts amounting to \$1,351,200 and appropriations of \$1,334,572 were announced. Emphasis was laid on the fact that within the limits of its annual appropriation each department has complete autonomy. A popular idea that the Institution is wealthy was discredited and the statement made that its research enterprises were restricted by lack of funds. During the year two trustees, William N. Frew and Seth Low (q.v.), and a research associate, Prof. Harry Clary Jones (q.v.), died.

During the past year the new 100-inch reflecting telescope for the Mount Wilson Solar Observatory was virtually completed. It was expected that the parts would be assembled in

1917. Its installation will give the observatory an unrivaled equipment for most branches of stellar work. The department of terrestrial magnetism and the geophysical laboratory reported that the nonmagnetic ship *Carnegie* left Dutch Harbor, Alaska, Aug. 7, 1915, and left Lyttleton, New Zealand, December 6th for a voyage around the world (17,084 nautical miles), accomplished in 118 days. Up to May, 1916, the publications of the geophysical laboratory numbered 240. As a result of the joint researches of the late Dr. C. H. F. Peters, astronomer of Hamilton College, and Mr. Edward B. Knobel, past president of the Royal Astronomical Society, London, the Institution published in 1916 a new edition of Hipparchus's great catalogue of stellar positions, edited by Ptolemy and since known as *Ptolemy's Almagest*. Dr. Frederic E. Clements, an associate attached to the department of botanical research, wrote an important book entitled *Plant Succession: an Analysis of the Development of Vegetation*. Other notable books published under the auspices of the Institution include: the eighth and last volume of Dr. H. Oskar Sommer's edition of the Vulgate Version of the Arthurian Romances; concordances to Spencer, Keats, and Horace; and a new edition of *The Old Yellow Book*. Prof. J. B. Scott has edited eight volumes in "Classics of International Law." Victor S. Clark wrote a *History of Manufactures in the United States (1607-1860)*. During the year the Executive Committee authorized the publication of 23 volumes at an estimated cost of about \$60,000. In 1916, 35 volumes were issued, as contrasted with 3 volumes in 1902, and 24 additional volumes were in press. Since the foundation of the Institution there have been distributed by gifts to libraries and authors, and by sales, 159,908 volumes.

**CAROLINE ISLANDS.** A group of islands lying north of New Guinea and forming a dependency of the German New Guinea Protectorate (q.v.), but occupied by British troops in 1914. Area (Caroline, Palau, and Mariana or Ladrone Islands, excepting Guam), 307 square miles; population, about 55,000; white population (1913), 264 (of whom 154 Germans). Capitals, Ponapé and Yap.

**CARPENTER, LOUIS HENRY.** An American soldier, died in Philadelphia, Jan. 31, 1916. Born at Glassboro, N. J., in 1839, he graduated A.B. from the Central High School of Philadelphia in 1856, and later studied at the University of Pennsylvania. He fought throughout the Civil War, rising from private to brevet-colonel of volunteers, and afterwards he received a captain's commission in the regular army. For 13 years he served on the Indian frontier, particularly distinguishing himself in 1868, when he marched 70 miles to the relief of General Forsyth, besieged by the Indians on the Republican River in Kansas. Afterward General Carpenter commanded various Western forts, and in 1896 was president of the board to revise cavalry tactics. In the Spanish-American War he held the rank of brigadier-general of volunteers; during 1898-99 he served as military governor of the Province of Puerto Principe. In the latter year he was retired, after promotion to brigadier-general, U. S. A. For his services during the Indian campaigns, the Congressional Medal of Honor was awarded to him in 1898.

**CASASUS, JOAQUIN D.** A Mexican lawyer, financier, and diplomat, died in New York City, Feb. 25, 1916. He was born in the State of Tabasco, Mexico, in 1859, studied at the universities of Yucatan and Mexico, and practiced law. At 28 he attended, as a delegate appointed by President Diaz, the Military Congress at The Hague. At various times he was dean of the law and commercial departments of the University of Mexico and president of the Banco Central Mexicano. In 1905 he was appointed Ambassador to the United States, an office which he held during the administrations of Presidents Roosevelt and Taft. Señor Casasus, at the time of his death, was engaged in law practice in New York. He was known as a writer on financial and literary subjects, and had translated seven volumes of English classics into Spanish. Recognition of his work came to him from the literary societies of Mexico and Spain.

**CASEMENT, SIR ROGER DAVID.** An Irish conspirator, hanged Aug. 3, 1916, in Pentonville Jail, London, for high treason. His activities culminated in a sensational effort to prepare for and assist the Sinn Fein revolt against British rule that broke out in Dublin in April, 1916. For some months he had been in Germany, and his known desire to see Ireland freed from English control led to a general belief that he was plotting to get German aid for his plans, or to help Germany in the great war. It was reported that the British government had set a price for his capture. On April 21, 1916, he was captured in Ireland, after landing at Tralee from a German submarine. The submarine was accompanied by a German tramp steamer carrying a cargo of arms, to be used in the revolt, but it was blown up when capture by British war vessels was imminent. Casement was taken to London, and was tried in the High Court before the Lord Chief Justice (Lord Reading), two other justices, and a jury. The indictment, based on the Treason Act of 1351, charged the prisoner with "adhering to the King's enemies elsewhere than in the King's realm, to wit, in the Empire of Germany." Sir Roger's activities in Germany came prominently before the court. It was charged that he had endeavored, by various means, to persuade Irishmen, who had been fighting for Britain and had been captured by Germany and imprisoned at the Limburg camp, to join an Irish brigade. This brigade was to be equipped by the German government, and at some time was to be sent to Ireland in an effort for independence. Sir Roger, whose trial began June 26th, pleaded not guilty, and also denied that he had taken any bribe from Ger-

many or had given any aid to Germany against England. On June 29th he was found guilty as charged, and was sentenced to be hanged. After the jury brought in their verdict, Casement read a long and eloquent statement in his own defense, stating that in being tried by an English jury he did not consider that he had had trial by his peers; that he had not sought directly to injure England, but rather to perform a patriotic service to the country which he considered his own, Ireland. He maintained a remarkable composure. Daniel J. Bailey, an Irishman who accompanied Casement in the submarine, was tried with him, but was freed, evidence having been produced that he returned to Ireland expecting to reenlist in the British army. The case for the Crown was conducted by the Attorney General, Sir F. E. Smith, and for Casement by Sergeant Sullivan, a brilliant Irish barrister, who, after an impassioned defense of Sir Roger, collapsed.

Between the time of conviction and the execution, many efforts were made to have the sentence mitigated. Appeals were taken without effect. A group of British authors signed a petition, and feeling among Irish-Americans was so strong that a resolution was passed by the United States Senate and sent to the British government, urging that leniency be shown. The government argued that only as a matter of policy, as a concession to the feelings of many Irishmen then fighting on the Continent for England, could it interfere with the action of the court; and such a motive it could not consider. Public opinion in England generally held that death was the just penalty for treason at such a time; the *London Daily News*, however, considered the government's position unwise.

Sir Roger Casement was born Sept. 1, 1864. From 1895 to 1913 he was engaged in the British consular service, after a three years' connection with the Niger Coast Oil Rivers Protectorate. By 1898 he had become consul for the Portuguese Possessions in West Africa, south of the Gulf of Guinea. For special services in Cape Town in 1899 and 1900, during the war in South Africa, he was given the Queen's medal. Later he distinguished himself by exposing the treatment of natives in King Leopold's Congo State. In 1905 he was made a C.M.G., the next year became consul for the state of São Paulo, Brazil, and in 1908 was transferred to Para. In 1912, while consul general at Rio de Janeiro, an office from which he retired on a pension in 1913, he became widely known for his investigations of the cruelties practiced on natives of Putumayo by a British rubber company. In 1909 he had been knighted. His pension he gave up when he went to Germany in behalf of the Irish cause, and after the exposure of his activities he was deprived of knighthood. At various times he visited the United States, and recently had been there to raise funds for the Irish Volunteers. After his death, an American friend, Mr. John Quinn, published an article in which he discussed Casement's attitude toward the British government. Sir Roger, like other Irishmen, considered that Ireland had been betrayed by the refusal to put the Home Rule Bill into immediate operation, and that Sir Edward Carson and other leaders of the Ulster revolt, who escaped punishment, were traitors for the sake of a sec-

tion of Ireland and were inspired by English Tories, while he was ready to work for all Ireland against England from the highest motives of patriotism.

**CASE SCHOOL OF APPLIED SCIENCE.**

A non-sectarian, technical school at Cleveland, Ohio, founded in 1881. There were 551 students in the fall of 1916 and besides 57 faculty members there were 17 special lecturers. The productive funds were \$2,458,788 and the total income, \$206,513. The library contains 13,505 volumes. President, Charles Sumner Howe.

**CATERPILLAR TRACTOR.** See **MILITARY PROGRESS.**

**CATHOLIC CHURCH.** See **ROMAN CATHOLIC CHURCH.**

**CATHOLIC UNIVERSITY OF AMERICA.**

A Roman Catholic institution for higher education, at Washington, D. C. Founded in 1887, it is the national university of the Church, and gives the higher degrees as well as several baccalaureate degrees. In the fall of 1916 there were 560 students in the schools of the university (schools of the sacred sciences, law, philosophy, letters, and sciences), 453 in affiliated colleges, and 600 in summer schools, a total of 1613. The faculty numbered 80. The productive funds of the institution amounted to about \$1,833,870, from which a revenue of about \$212,380 was obtained. At the end of the year the library had 103,000 volumes. President, Rt. Rev. Thomas Joseph Shahan.

**CATLIN, ISAAC SWARTWOOD.** An American soldier and lawyer, died Jan. 19, 1916, in Brooklyn, N. Y. He was born at Owego, N. Y., in 1835, and when 25 years old was mayor of this town. In 1861 he raised a company of volunteers, of which he became captain, and distinguished himself at the battle of Big Bethel. Later, as lieutenant-colonel and colonel of the 109th New York Volunteers, he fought in most of the battles from the Wilderness to the fall of Petersburg. At Petersburg, in spite of two wounds, one of which shattered his right leg, he was carried at the head of his troops who captured certain unexploded mines. This exploit brought him the Congressional medal of honor. In 1864-65 he was president of a court martial in Washington. At the close of the war he received brevets of brigadier-general and major-general of volunteers. General Catlin returned to Owego, where he was elected district attorney of Tioga County. Later, after his removal to Brooklyn, where he established himself in law practice with Gen. Benjamin F. Tracy, he was elected (1871) United States district attorney for the Eastern District of New York. From 1887 to 1893 he served as district attorney of Kings County. During the Spanish-American War he visited Cuba and the Philippines and wrote on conditions in these islands; he prepared memoirs which were to be published after his death.

**CELEBRATIONS.** Among the more important celebrations that occurred during the year were the following:

**NEWARK.** On May 17, 1866, a band of men, women, and children landed on the banks of the Passaic River, N. J., and started a settlement that has grown into the city of Newark, ranking 14th among the cities of the United States, with a population of nearly 400,000. In 1913 Jacob Haussling, mayor of Newark, suggested in his annual message the celebration of Newark's 250th anniversary, and on April 3, 1914, subsequent to suitable legislation, he was authorized to appoint a committee of 100 residents to prepare plans and conduct the celebration. Franklin Murphy became chairman of this committee, and its first meeting was held on July 11, 1914, after which a number of committees undertook the preparation of the celebration. A fund of \$250,000 was raised among the citizens, and *The Newarker*, a monthly publication, began its series of 12 issues on Nov. 1, 1915. Among the preliminary events was a poster exhibit to which 230 posters from 163 artists were shown, and prizes of \$1000, \$500, and \$300 were given to the best original designs offered. (See the *Newark Poster Catalogue*, 1915.) Also a poem competition was authorized and prizes of \$250, \$150, \$100, and ten of \$50 each were offered. Over 900 manuscripts were received, and a volume of the better poems is announced for publication. The celebration began on May 1, 1916, and continued until November 1st, with a continuous series of interesting events, of which only the more important can be mentioned. The formal exercises began on May 1st, with a military parade in the morning, the historic ceremonies with addresses in the afternoon, and the first of six musical festivals in the evening. On May 10th occurred the unveiling of a tablet to the honor of the Founders of the First Congregational Church and the dedication of three civic monuments at Puritan Landing Place, Branford Place, and at the Public Library; also the unveiling of a tablet marking the site of the parsonage of Dr. Aaron Burr. Three days later Newark's Industrial Exposition was inaugurated by President Wilson, and the Robert Treat Hotel was opened. Founders' Day was celebrated on May 17th, with a parade followed in the afternoon by special religious and historic ceremonies in the First Presbyterian Church. The most spectacular event was the Newark Historical Pageant, given on the evenings of May 30th, 31st, June 1st, and 2nd, in Weequahic Park, in which 3500 persons in costume participated. The audiences were from 52,000 to 70,000 and were the largest in the history of New Jersey. (See *The Book of Words. The Pageant of Newark*, by Thomas Wood Stevens, 1916.) On July 26th occurred the formal unveiling of the Colleoni equestrian statue by Verrocchio of which a bronze replica by J. Massey Rhind was presented to Newark by Christian W. Feigenspan. Other events included numerous parades, some of which were at night, and consisted of floats showing historic occasions as well as the special industries of the city. Also there were many congresses, conventions, and gatherings of different kinds, as well as various athletic and sport meetings, notably on September 8th, 9th, and 10th, of the Amateur Athletic Union, at which six new records were made (120-yard hurdles, 14 $\frac{3}{4}$  sec.; 880-yard run, 1 min., 54 sec.; 220-yard hurdles, 24 sec.; 440-yard hurdles, 54 $\frac{3}{4}$  sec.; discus throwing, 145 ft., 4 $\frac{1}{2}$  in.; javelin

throwing, 190 ft., 6 in.). A memorial building to cost \$1,500,000 will be built, a commemorative medal was struck, a flag for the city of Newark chosen, and a memorial volume descriptive of the celebration is in course of preparation.

**INDIANA.** On Dec. 11, 1816, Indiana was admitted to the Union as the 19th State and the 6th after the original 13. The celebration of this important event—the centennial of the State—was placed by the Governor under the general guidance of the Indiana Historical Commission. County and local celebrations were encouraged, but the principal efforts of the commission in cooperation with Indiana University and certain private citizens were concentrated on three great and historic pageants. The first of these, the Pageant of Bloomington and Indiana University, presented the educational development of the State as focused in that community and served by the university. It was given on the campus of the university in Bloomington on May 16th, 17th, 18th, and 20th. The second was the Pageant of Corydon, the pioneer capital of Indiana, and gave the drama of the preëminence of the town at the time when for 12 years it was the territorial and State capital. It was held in front of the old State capitol in Corydon, June 2nd and 3d. The final and culminating one of the series was the Pageant of Indiana and depicted the development of the State as a community from its exploration by La Salle to the centennial of its admission to the Union. It was given in Riverside Park, Indianapolis, during October 2nd–8th. These pageants were dramas in the strictest sense of the word, not processions, and were performed complete every day on grounds that were historic and characteristic of the community life there presented. The dramas of these three pageants were written by and presented under the direction of William C. Langdon, by whom also the words have been published. In the first of these pageants was sung the "Hymn to Indiana," written by Mr. Langdon and set to music by Charles D. Campbell, which has received very general approval throughout the State. In these pageants a design for a State flag was presented which has been officially accepted. In Indianapolis the celebration began on October 2nd, with a parade of civic, patriotic, and fraternal organizations. Also there was held in the Herron Art Institute an exposition of fine and domestic arts, the product of Indiana for the last 100 years. Home-coming day was celebrated on October 3d. A number of the counties also had pageants in their celebrations, notably Earlham College, Fort Wayne, South Bend, Crawfordsville, and Vincennes, while Peru had an outdoor Indian drama, as the development of the community was not the subject. The celebrations also included a widespread observance of Indiana Products Day and a general home-coming which was stimulated by the publication of a pamphlet under the editorship of George Ade and including contributions from James Whitcomb Riley and other prominent Indiana writers.

**OTHER CELEBRATIONS.** The forthcoming celebrations at Gulfport, Miss., San Antonio, Texas, and Plymouth, Mass., with proposed expositions, are described under **EXPOSITIONS**. See also **AMERICAN BIBLE SOCIETY**; **DRAMA**; **LITERATURE**,

**ENGLISH AND AMERICAN**; **RUTGERS COLLEGE**; **SPANISH LITERATURE**; **YALE UNIVERSITY**.

**CELTIC PHILOLOGY.** See **PHILOLOGY**, **MODERN**.

**CEMENT.** The total quantity of Portland, natural, and puzzolan cement marketed or shipped from the mines in the United States in 1915, was 87,685,222 barrels, valued at \$75,155,102, as compared with 87,257,552 barrels, valued at \$80,533,283, in 1914. This was an increase of about 5 per cent in quantity and a decrease of about 7 per cent in value. The cement marketed or produced included 86,891,681 barrels of Portland cement, 750,863 of natural cement, and 42,678 of puzzolan cement. The largest amount of Portland cement is produced in Pennsylvania, where in 1915 38,648,941 barrels were produced. Other States producing in the order named are Indiana, Illinois, New York, Michigan, Missouri, Iowa, California, Kansas, and Ohio. The natural cement is produced in largest quantities in New York, Illinois, Indiana, Ohio, Pennsylvania, Kansas, and Minnesota. The total quantity produced in 1915 was 750,863 barrels, valued at \$358,672. Puzzolan is produced in Alabama, New York, Ohio, and Pennsylvania. The total production in 1915 was 42,678 barrels, valued at \$39,801.

The total export of cement in the United States in 1915 was 2,565,031 barrels, valued at \$3,361,451.

The shipments of Portland cement from the mines in 1916 approximated 94,508,000 barrels compared with 86,891,681 barrels in 1915, an increase of 8.8 per cent. The production of Portland cement approximated 91,194,000 barrels compared with 85,114,907 barrels in 1915. The year holds the record for shipments of Portland cement. High prices prevailed throughout the United States except at a few points. Six, new plants reported production during the year, one each in California, Minnesota, New York, Oklahoma, Oregon, and Texas.

**CEMENT SPECIFICATIONS.** After several years' work a joint conference committee representing the United States government, the American Society for Testing Materials, and the American Society of Civil Engineers finally reported in favor of a single standard cement specification for the United States. The principal change was the increase of fineness from 75 to 78 per cent for passage through the 200-mesh sieve. No change was made in the test for constancy of volume, while for determining the time of setting either the Gillmore needles or the Vicat apparatus may be used. The report was accepted at the annual meeting of the American Society for Testing Materials and the specifications were adopted to become effective Jan. 1, 1917, by a letter ballot.

**POTASH AS A BY-PRODUCT IN CEMENT MANUFACTURE.** During the year the first plant to use the Cottrell fume precipitation process for the recovery of potash as a by-product in Portland-cement manufacture was put into successful operation at the works of the Security Cement and Lime Co., near Hagerstown, Md. The process consists of passing the dust-laden gases from the kilns through an intense electrostatic field where the dust is precipitated on the positive and negative electrodes, the method being essentially the same as in the attraction of the pith ball by electrified rubber or glass. The project naturally involved the installation

of generators and transformers capable of stepping up the current to 70,000 volts and the provision of adequate insulation and suitable electrodes. With two kilns 7 x 100 feet and three kilns 8 x 125 feet, the production of potash dust averaged from 20 to 25 tons per 24-hour day, and this contained from 5 to 10 per cent pure K<sub>2</sub>O present in the form of potassium sulphate and equivalent to approximately 10 to 20 per cent of the sulphate. The dust being finely divided is highly desirable for use as a fertilizer. In addition to the recovery of potash, the process has a beneficial effect on the production of cement, increasing the cement clinker and the fuel economy of the kilns. Consult *Engineering News*, Dec. 28, 1916. See CONCRETE.

**CENTRAL AMERICA.** The name commonly applied to that portion of North America which comprises the republics of Guatemala, Honduras, Salvador, Nicaragua, and Costa Rica, and the colony of British Honduras. See these titles. According to some authorities, Central America includes all the territory between the Isthmus of Panama and the Isthmus of Tehuantepec; according to others, it extends from Colombia to Mexico.

**CERIUM.** See CHEMISTRY, INDUSTRIAL.

**CERVANTES TERCENTENARY.** See SPANISH LITERATURE.

**CEYLON.** An island in the Indian Ocean, south of India, with an extreme length of 266 miles and greatest width 140½ miles; a British crown colony. The capital is Colombo. Area, 25,332 square miles; population, according to the census of March 10, 1911, 4,110,367. More than half the people (2,474,393) are Buddhists. The city of Colombo has 213,398 inhabitants; Negombo, 13,152; Moratuwa, 27,253; Kalutara, 13,006; Kandy, 30,148; Jaffna, 40,539; Galle, 40,187; Matara, 13,851; Batticaloa, 10,715.

Commercial and financial statistics appear below, in rupees (total trade and trade with the United Kingdom; total shipping and British shipping):

	1912	1913	1914
Imports	181,999,991	199,640,797	176,967,156
Imports, U. K.	50,999,044	58,199,628	51,504,240
Exports	198,954,902	234,868,554	219,374,046

Shipping Br.	10,114,485	12,313,392	9,403,108

\* Tonnage entered and cleared.

Public debt, Dec. 31, 1914, Rs. 106,024,325. The railways are all owned and operated by the government.

The length of railway open for traffic in Ceylon Sept. 30, 1915, was 692½ miles, as against 672 miles at the corresponding time of 1914, the increase being due to the opening of a section of a line to Chilaw. The rolling stock had increased by 18 new passenger and 186 new goods vehicles, including a number of tank wagons, while the total expenditure to the close of September, 1915, including additional accommodation and improvements, amounted to £7,858,452. The Chilaw line was approaching completion in 1915, and it has been opened to Kochchikade for all descriptions of traffic. Progress had been made with the Pelmadulla

and Badulla extensions, especially on sections between Ratnapura and Dela and between Bandarawela and Ella. Work was in progress on Colombo station extension, and earthwork was in hand on a main line double track between Ragama and Veyangoda. A survey from Chilaw to Puttalam had commenced, and a survey connecting the harbor line with the railway, via Mutwal, was completed.

**CHAMBERLAIN, SAMUEL SELWYN.** An American journalist, died in San Francisco Jan. 25, 1916. Son of a noted newspaper man, Ivory Chamberlain, he was born at Walworth, N. Y., in 1851. After his graduation from New York University in 1871, he was successively on the staffs of the Newark *Advertiser*, the New York *Herald*, and the New York *World*, until 1881, when he was called to the *Evening Telegram*, one of James Gordon Bennett's papers, as managing editor. As private secretary to Mr. Bennett, Mr. Chamberlain traveled extensively in Europe. After 1889, except for one year, he was connected with the Hearst publications, first as editor of the San Francisco *Examiner*, and later in executive capacities on the New York *Evening Journal*, the *American*, the *Cosmopolitan Magazine*, and the Boston *American*, of which he was the publisher at the time of his death.

**CHAMORRO, EMILIANO.** Elected President of Nicaragua Oct. 2, 1916. He was unopposed. Chamorro had been prominent for some years as a conservative leader. See NICARAGUA.

**CHANNEL TUNNEL.** See TUNNELS.

**CHARITIES.** The year 1916 was not notable in charitable activities on account of any spectacular gifts but nevertheless probably exceeded any preceding year in the volume of funds devoted to philanthropic purposes. The total was estimated at fully one billion dollars, or nearly twice that of 1915. There were no new large foundations (see GIFTS) but the work of the Rockefeller Foundation (see ROCKEFELLER PHILANTHROPIC BOARDS), Russell Sage Foundation, and others less comprehensive reached many lines of activity. The most prominent feature of the world's charity during the year was the continuance and the expansion of the work in behalf of various classes of victims of the European war as described under RELIEF FOR WAR VICTIMS. In the United States the remarkable industrial prosperity of the year not only removed the worst aspects of dependency due to unemployment (q.v.) but supplied an unusually abundant support for various relief, investigational, and corrective agencies. In this connection the reader should consult the articles: JUVENILE COURTS; MINIMUM WAGE; OCCUPATIONAL DISEASES; OLD-AGE PENSIONS; PENSIONS FOR MOTHERS; PENALOGY; PROSTITUTION; WOMEN IN INDUSTRY; and WORKMEN'S COMPENSATION. In the numerous conferences of the year there was a marked tendency toward the perfection of organization for charitable agencies, elaboration and systematization of records, increased scientific inquiry with a view to prevention, and greater interest in general social, economic, and biological conditions from which poverty, destitution, and delinquency spring. The tendency toward better coördination is shown by the development of such bodies as the National Federation of Catholic Societies, the National Association of Jewish Social Workers, and na-

tional organizations interested in the blind, the deaf and dumb, or the tubercular; or in probation work, district nursing, or other aspects of social work.

THE NATIONAL CONFERENCE OF CHARITIES AND CORRECTION held its 43d annual meeting at Indianapolis May 10th-17th. The entire programme was devoted to subjects dealing with the relations of education and social workers to the fields of charity and correction. The efficiency of the Gary school plan and its social bearing, the effective development of the school centre, vocational guidance, and the promotion of effective public schools aided by various social agencies received special attention in the session on children under the leadership of Julia C. Lathrop of the Federal Children's Bureau. Under the sections on health, feeble-mindedness, and insanity, the significance of mental and physical factors for bad social conditions were discussed. The growing tendency to put relief work in the hands of public agencies received attention in the section on public and private charities; and emphasis was laid on the importance of the organization and administration of charity work and the keeping of proper records in accordance with the highest standards.

Several special meetings were held at which such subjects as birth control, results of vice investigations and surveys, welfare work in industrial establishments, and land and economic freedom were discussed. One such meeting was devoted to the discussion of relations between Socialism and social work and resulted in the creation of a committee to arrange for sessions on social workers and radical economic movements to be held during the next National Conference.

Among the most prominent speakers were: John H. Finley, Commissioner of Education of New York; Mrs. Florence Kelley, General Secretary of the National Consumers' League; Edward W. Clopper of the National Child Labor Committee; and Thomas Mott Osborne, former warden of Sing Sing. Percy Alden of London delivered an impressive speech on "National Stress as a Stimulus to Social Thought and Action," citing the influence of the present war on social welfare legislation in England.

For several years plans for a reorganization of the Conference have been under discussion. Each year many independent groups whose work is closely affiliated with that of the Conference meet jointly with it. A special committee previously appointed to consider relations with these kindred organizations proposed in its report to modify the Conference scheme of organization in such a way as to absorb these independent groups. The report suggested more continuous and permanent organizations of the main sections in the Conference, and pointed out the great desirability of a larger organization of the Conference office for work between sessions. The latter development would result in much more definite relations between the National Conference and State and local conferences. A special committee was appointed to further these proposals.

The desire for a new and more suitable name for the Conference which would stress the social service phase of its work rather than the charity phase is another expression indicating the transition in its work and character. To

deal with community ills and needs by prevention rather than primarily with the curing of individual ailments is the new policy. The committee appointed last year to consider a change of name reported in favor of such a move but recommended continuance of the committee in order to secure definite suggestions.

The proposed programme for next year would direct attention to the prevention of poverty, disease, defectiveness, and crime. The next session will meet at Pittsburgh with Frederic Almy of Buffalo as president. The vice-presidents are Joseph Lee of Boston, Julia C. Lathrop of Washington, and Rabbi Emil W. Leipziger of New Orleans. The committee chairmen for 1917 are: Executive, Rev. Francis H. Gaviak of Indianapolis; children, Wilford S. Reynolds, superintendent, Illinois Children's Home and Aid Society; correction, Roscoe Pound, dean, Harvard Law School; family and community, W. Frank Persons, New York Charity Organization Society; health, Dr. Charles P. Emerson, dean, University of Indiana Medical School; public charities, A. L. Bowen, executive secretary, Illinois State Charities Commission; mental hygiene, Dr. Owen Copp, Philadelphia; community programmes, Robert A. Woods, South End House, Boston; social insurance, Max Senior, Cincinnati; rural social problems, John H. Gillette, professor of sociology, University of North Dakota.

STATE AND LOCAL DEVELOPMENTS. State and local conferences are held annually throughout the country; only a few of these may here be referred to. Vermont held its first State conference in January. Indiana merged its State conference with the National Conference above noted. The New York State Conference on Charities and Corrections held its 17th annual meeting in Poughkeepsie during November. Dr. Edward L. Keyes read an important paper on "The Social and Public Health Aspects of the Venereal Disease Problem," and John A. Fitch one on "The Relation Between Trade Unions and Social Workers." Thomas Mott Osborne spoke on the Mutual Welfare League; this proved a lively meeting since Mr. Osborne's speech drew forth a rejoinder from State Superintendent of Prisons Carter. The next conference will be held at Binghamton, with Dr. Lee K. Frankel of New York City as president.

NEW YORK CITY AND STATE CHARITY CONTROVERSY. One of the most interesting controversies of its kind and one which will mark the beginning of more efficiently managed systems of public charity instead of the old incompetent system of heterogeneous private charity was that between the New York State Board of Charity and the New York City Charity Department. This controversy was long and bitter; it resulted from an investigation begun by the State Board in 1914. The investigation revealed shocking conditions in private or denominational homes in which were many public charges of the city. The homes were under both Protestant and Catholic administration and were paid by the city for the care of children. Notwithstanding the unsanitary and generally degrading state of affairs, these homes were given the necessary certificates by the State Board of Charities. R. W. Hibbard, the late Dr. Dan C. Potter, Father William B. Farrell, and Manager John J. Dunn were the

men who bore the brunt of the accusations, but the Supreme Court dismissed the charges against them in the September court.

The State board's defense was briefly: That under the constitution and laws of the State it is merely an inspecting and supervising body; that it has performed its full duty when it issues or withholds certificates on the basis of its inspectors' reports; that to withhold certificates for slight causes or for a protracted period would automatically stop payment of city money and tend to put an institution out of business; that it had been compelled to recognize that many institutions had not sufficient money to raise standards rapidly; that the city department itself has a duty at least to cooperate with the State board.

The city authorities replied by saying that the power to inspect and supervise carried with it the power to compel adherence to standards and that moreover the spirit of the age and laws of the State do not excuse the remissness of the board. The city administration has since been trying to meet the exigencies of the situation by the experiment of placing dependent children in private families through a bureau of the Department of Public Charities. Also through large appropriations for widows' pensions, the city is keeping in their own homes some children who otherwise would have to be cared for in institutions.

REPORT ON NEW YORK STATE CHARITIES. In October, 1916, Charles H. Strong, special commissioner appointed by Governor Whitman of New York to examine into the management and affairs of the New York State Board of Charities, of several related boards and commissions, and into the charges brought by the city Department of Public Charities against the State board on account of inspections of private institutions receiving money from the city, made a report of his investigations.

Upholding the charges of the city, the report recommended a thorough reorganization of the State Board of Charities and the abolition of several boards and commissions. In reorganizing the State board it would be made to comprise nine members appointed from the State at large, of whom three would be paid and six not paid; the new board would take the place of twelve unpaid members appointed by the Governor from districts; of the nine, at least one member would be a woman. Individual members would serve during good behavior and be removable by the Governor for cause. Special qualifications for membership are also recommended. Two new bureaus are recommended: a bureau for dependent children and one for mental deficiency. The report further recommended an express grant of power to the State board to adopt rules and regulations for the reception and retention of inmates in State charitable institutions. Also it urged the erection of an institution for defective delinquents, and the care of adult female delinquents in public institutions exclusively. It favored the abolition of the office of fiscal supervision of State charities, of the Salary Classification Commission, the Building Improvement Commission, the Commission on Sites, Grounds, and Buildings, and the Board of Examiners of Feeble-minded, Criminals, and other Defectives. Mr. Strong's plan was highly commended by some, while others saw only danger in some of the changes ad-

vocated. The New York State Conference of Charities and Correction officially placed that organization in opposition to Commissioner Strong's plan by resolutions adopted during its annual meeting in November. See also NEW YORK, *Politics and Government*.

NEW YORK CITY CHARITIES. There has been a reform in the method of handling applicants at the Municipal Lodging House, an institution for men and women out of work and funds. A medical examination of each applicant is given at entrance in order to segregate the infected and there is a miniature hospital to care for those who are ill. A mental test of each applicant is made and his social history as far as possible is recorded. Since the object of the workers in the house is not only to care for the unemployed but to aid them to become self-supporting, employment is furnished within the house if it cannot be found outside. In order to develop occupational work among convalescent and chronic patients of the hospital department and among inmates of city homes, a committee of prominent citizens was appointed by Commissioner of Charities Kingsbury to take charge of this work. The instruction is under the direction of a competent specialist. A Children's Home Bureau was a newly organized branch of the charities department. Its purpose is to provide for the placing of orphans and other dependent children under eight years of age in families of their own religious faith instead of in private child-caring institutions. This move has been made possible through private funds. Second Deputy Commissioner W. J. Doherty, for 15 years Executive Secretary of the Catholic Home Bureau, will supervise the new bureau. The department has also, with the aid of the Mendicancy Squad, regulated independent day nurseries.

MARYLAND. The Maryland Conference of Charities and Corrections held its 12th annual meeting in Baltimore on December 1st. Housing, vocational training, prison colonies, and infantile paralysis were the leading topics of the programme. A significant change was made both in the name of the conference and in the extent of its territory. Henceforth it is to be the Conference on Social Work, and its territory will embrace Delaware, Maryland, and the District of Columbia. The next meeting will be held in Wilmington, Del., with George S. Wilson of the Children's Board of Guardians of the District of Columbia as president.

By the 1916 Legislature, the Board of State Aid and Charities was reorganized with the Governor a member and the other members so classified that half of them retire every two years. The most important provision of the new law was the substitution of per capita appropriations to institutions in place of present lump sums with rates to be fixed by the State Board of Public Affairs. Another important measure affecting charity and social workers in many ways was that compelling adult children, who are financially able, to support their dependent parents instead of shifting responsibility upon the community. The law also provided that adults whether parents, guardians, employers, or others who contribute to the delinquency of children may be haled into court by an interested or responsible party. Circuit court judges are empowered to designate one of their number to sit in juvenile cases, thus making

possible the extension of the juvenile court system to all the counties.

**NEW JERSEY.** The New Jersey Legislature considered several features of the work of charity and correction during its last session. The committee appointed to study mental defectives was continued. A campaign by private interests to relieve overcrowded conditions in the State hospital for insane and to provide for the care of feeble-minded resulted in an appropriation of \$150,000 for a farm colony for insane. In the general appropriation bill \$25,000 was given for a feeble-minded colony under the direction of a board of managers of which the Committee of Charities and Correction is head. The campaign for a state psychopathic hospital was begun. The care of dependent children by the State was endorsed by an appropriation for the work of the State Board of Children's Guardians and for the work of supervising dependent widows and children who receive funds under the law to promote the home life of dependent children.

**THE IOWA STATE CONFERENCE OF CHARITIES AND CORRECTIONS** was held at Ottumwa, October 22nd-24th. Child welfare was the central subject of discussion, special attention being given to questions pertaining to larger use of the juvenile court, child-health in the pre-school period, stricter child labor laws, vocational training, and increased opportunity for recreation. A legislative committee of seven was appointed to cooperate with similar committees of other State organizations in order to bring about if possible social legislation regarding limitation of hours of work for women, establishment of child welfare research stations at State universities, and the codification of all laws relating to children. The president for 1917 is Paul S. Pierce of Iowa City.

**MASSACHUSETTS.** The Massachusetts Legislature passed several measures bearing on social work and charities. The old State Board of Insanity, which was paid, was abolished, and a Commission on Mental Diseases, which enlists unpaid service, was created. A new Bureau of Prisons puts responsibility on a director with an advisory body of five members, consisting of three men and two women. County hospitals for use of all communities of less than 50,000 inhabitants are to be established to complete a system of public tuberculosis sanatoria; and the State Department of Health was directed to investigate non-pulmonary tuberculosis. The new third school for the feeble-minded received an appropriation. A committee was appointed to study the housing problem, and another to consider the problem of habit-forming drugs. A bill dealing with workmen's wages provided that three-fourths of a workman's income are exempt from assignment and all assignments require the wife's consent.

**TEXAS.** In October the Texas School of Civics and Philanthropy opened at Houston. This is a new training school for volunteer and professional workers in the social and civic field, and was founded by the Houston Council of Social Agencies which is under the supervision of the Houston Foundation, a municipal board of public welfare. The foundation furnishes the school's support for the first year with the aid of interested citizens, hence no tuition or registration fees will be charged the beginning classes. Headquarters of the school are in the

Houston City Hall. Representatives of the University of Texas, Rice Institute, several other educational institutions, and officials of the State Conference of Social Welfare, the Federated Jewish Charities, and the Congress of Mothers and Parent-Teacher Associations make up its advisory council. A two years' course in class room and field work leads to a certificate, the entrance requirements being the equivalent of a good secondary school and two years of university work.

In November the Department of Public Welfare of the city of Dallas opened a three months' course in applied philanthropy under the auspices of the United Charities of Dallas. Lectures will be given by city officials, teachers, physicians, clergymen, and instructors in the Southern Methodist University.

**Bibliography.** Among publications relating to charities were the following: E. T. Devine, *Pauperism; An Analysis* (a pamphlet); Indiana Board of State Charities, *A Century of Progress*; C. S. Loch, *Charity and Social Life*; F. H. McLean, *Survey of the Charities of the City of Burlington, Vt.* Reports were issued by the National, the Canadian, and the New York State Conferences, among others of like source.

**CHARLES I, EMPEROR OF AUSTRIA AND KING OF HUNGARY,** succeeded Emperor Francis Joseph (q.v.) upon the latter's death Nov. 21, 1916. Although not in direct line of succession, being only a grandnephew of the Emperor, Archduke Charles Francis Joseph (as he was earlier known), came to be regarded as heir presumptive. The Archduke Francis Ferdinand (his uncle), who was murdered with his wife at Sarajevo, Bosnia, in July, 1914, had married outside of royalty, thereby greatly displeasing Francis Joseph, and although the Archduke at the time of his death was the heir, none of his children were to be allowed to succeed him. It had been decided that Charles should become co-regent in December, 1916. In marked contrast to the unenviable reputation of the murdered Archduke is that of the Emperor, about whom all of the little that is known is favorable. He was born at Persenbeug Aug. 17, 1887, the son of Archduke Otto and Princess Maria, who came from Saxony. It is said that his parents endeavored to keep him away from harmful court influences and therefore sent him first to one of the large Viennese boys' schools. Afterwards he went into the army and became a major in the 39th Austrian Infantry, also holding honorary commissions in Prussian, Saxon, and Bavarian regiments. His military life had been spent not in the capital but in distant garrison towns of the Empire until the European war, in which nominally he commanded the army that invaded Rumania. Charles is said to be a good linguist, as is necessary in a realm comprising 17 distinct nationalities, and he is popular with the people. Since the beginning of the war he has been receiving a training in foreign affairs from Count von Berchtold. The new Emperor was married in 1911 to the Princess Zita of Bourbon-Parma, in whom Francis Joseph found a strong resemblance to his murdered wife, the Empress Elizabeth. The royal couple have two sons and a daughter, the heir being the Archduke Francis Joseph Otto, born in 1912. The Emperor and Empress were crowned King and Queen of Hungary on December 30th, at Budapest. See AUSTRIA-HUNGARY, *History*.

**CHARMES, FRANCIS.** A French man of letters and publicist, died in Paris, Jan. 4, 1916. Born at Aurillac in 1848, and educated at the college of his native town, at the Clermont-Ferrand and Poitiers lyceums, and at the Ecole de Droit, Paris, he became editor of the *Journal des Débats* at 24. This post he held for eight years, and again from 1889 to 1907. From 1893 to 1907 also, he served as editor of the famous *Revue des Deux Mondes*, afterward being its manager. M. Charmes's political activity brought him several offices in the department of foreign affairs, and election as deputy, and later as senator, for Cantal. His literary distinction was recognized in 1908 by election to the French Academy. Numerous articles from his pen appeared in the journals edited by him, and for this type of writing he became best known. In book form he published *Etudes historiques et diplomatiques* (1893), and *L'Allemagne contre l'Europe: La Guerre, 1914-15* (1915).

**CHARRINGTON, JANET ACHURCH.** See **ACHURCH, JANET.**

**CHASE, WILLIAM MERRITT.** An American painter, known for his portraits and figure and still life studies, died in New York City, Oct. 25, 1916. He was born at Franklin, Ind., Nov. 1, 1849, studied art in Indianapolis and at the National Academy of Design in New York, and then went abroad, his masters being Piloty and Wagner in Munich. In that city, where he was associated with Frank Duvneck, he remained for some time, acquiring a reputation by his portraits. Throughout his life, he lived much abroad, especially in his Florentine villa, but he had studios in this country in New York, Philadelphia, and Shinnecock Hills, L. I. Mr. Chase's work gained wide recognition, in Europe as well as in the United States. His "Dorothy and Sister" was the first American painting hung in the Luxembourg, and at the Paris Exposition of 1889 he received a medal. His "Portrait of a Lady in Black" hangs in the Metropolitan Museum, and examples of his still-life paintings (his fish being especially noted) are in the Metropolitan Museum, the Pennsylvania Academy of Fine Arts, and the Brooklyn Institute Museum. The Union League Club, of New York, possesses his "Ready for the Ride." At the Panama-Pacific Exposition an entire room was devoted to works from his brush. Since 1890 Mr. Chase had been a member of the National Academy of Design, which awarded him the Proctor prize in 1912 for his "Portrait of Mrs. H." He was also a president of the Society of American Artists, before its amalgamation with the Academy, and had been admitted to the American Academy of Arts and Letters. His brilliant technique made him popular as a painter of portraits. Many distinguished men, including President Wilson, sat to him. Mr. Chase also became very well known as a teacher of painting.

**CHAUTAUQUA INSTITUTION.** It was noted in the 1915 YEAR BOOK that the attendance record of the Institution was adversely affected by the European war. During 1916, however, all previous records were surpassed. Between 50,000 and 60,000 persons, it is estimated, attended for longer or shorter periods. The Home Reading Course maintained its interest and numerical strength. In the Summer School (eight weeks' session) there were 3500

students in 200 different classes, the faculty numbering about 90. Income and attendance in this department showed marked growth. The official organ of the Home Reading Circle is *The Independent*, in which periodical *The Chautauquan* was merged some time ago. The members of the Institution receive monthly a bulletin of helps and hints called *The Round Table*. A New York office is maintained at 119 West 40th Street.

**CHEESE.** See **DAIRYING.**

**CHEMICAL INDUSTRIES, NATIONAL EXPOSITION OF.** See **CHEMISTRY, INDUSTRIAL.**

**CHEMICAL INDUSTRY.** See **CHEMISTRY, INDUSTRIAL.**

**CHEMICAL INDUSTRY, SOCIETY OF.** See **CHEMISTRY, INDUSTRIAL.**

**CHEMICAL SOCIETIES.** See **CHEMISTRY, INDUSTRIAL.**

**CHEMISTRY, GENERAL.** While no epoch-making generalizations or discoveries in chemical theory have been announced during 1916, the amount of research work carried on has been considerable. The continuation of the war in Europe has, of course, reduced to a minimum scientific investigations along lines not immediately concerned with the war and its problems; moreover, so few publications have been permitted to come through the Allied blockade during the year that practically nothing can be given concerning German chemical work.

Redeterminations of the atomic weights of six elements are known to have been published during the year, as follows: Bismuth, cadmium, columbium, hydrogen, neodymium, and zinc. In one case, that of columbium, the new values are considered an improvement over older ones, and the International Committee on Atomic Weights recommends that the value of this element be changed in the table to 93.1.

Prof. T. W. Richards of Harvard University and his associates have continued their researches on the atomic weights and physical properties of lead from different sources, and have confirmed and extended their previous results. The density of lead from Norwegian cleveite has been found by Richards and Wadsworth to be 11.273, which is distinctly less than any heretofore studied. The same authors have found the atomic weights of five different samples of lead to be as follows:

Ordinary lead .....	207.18
Radio-lead, Colorado .....	207.06
Radio-lead, Australia .....	206.34
Radio-lead, from bröggerite .....	206.12
Radio-lead, from cleveite .....	206.08

The last was the most carefully selected sample, and it is believed that the fact that this shows the lowest atomic weight is strong evidence that the higher results obtained from other samples were due merely to the accidental admixture of ordinary lead. As before, no new lines were found either in the ultraviolet or visible spectrum of any of these samples. Hence the atom of lead may be supposed to have a dual structure.

A branch of physical chemistry which has received considerable attention is the structure of crystals, particularly as brought out by x-rays. Previous successful interpretations of structure by this means have been made in almost every case on isometric or trigonal crystals, but Vegard, working at the University of Christiania,

has obtained important results with tetragonal crystals of oxides of the elements zirconium, titanium, and tin, and the related mineral zircon (zirconium silicate). The tetragonal structure has been found to be due, not to symmetry properties of the space-lattices of the metallic atoms, but to a tetragonal arrangement of the oxygen atoms. Each atom of metal lies between two oxygen atoms, the three being extended in a straight line, and the group thus formed, with the general formula  $MO_2$  (M standing for any one of the above listed elements), may be regarded as representing a sort of molecule within the main structure. The lines of these "molecules" are equally spaced and lie perpendicular to the tetragonal axis of the crystal, accounting for the fact that the vertical axis in these minerals is less than two-thirds as long as the horizontal ones.

In two elaborate papers on the constitution and fundamental properties of solids and liquids, Irving Langmuir of the Research Laboratory of the General Electric Co. has emphasized the chemical significance of the demonstration, through the aid of x-rays, that the crystals of polar substances are built up of separate atoms rather than of molecules. The atoms in such crystals must be held together by secondary or residual valence, and the whole crystal be regarded as a single molecule. In crystals of non-polar compounds group-molecules may be present, in which the atoms are held together by primary valence, but the group-molecules are in turn united by secondary valence. There is no longer any justification for dividing interatomic or intermolecular forces into "physical" and "chemical"; it is much more profitable to consider all such forces as strictly chemical in character. Evaporation, condensation, solution, crystallization, adsorption, surface tension, etc., should all be regarded as typical chemical phenomena. Experimental results are given which illustrate the applicability of this theory. In liquids as well as in solids features due to group molecules and to free atoms can also be recognized, and it now appears that molecules in the usual sense exist only in gases. The differences between a solid and a liquid, and in particular the mobility of the latter, are explained as a result of tautomeric rearrangements of the atoms. Adsorbed gases are to be regarded as chemically combined with the atoms forming the surface of the solid, the adsorbed layer usually consisting of a single layer of atoms or group-molecules. Correspondingly, the structure of the surface layer of atoms is regarded as the principal factor in determining the surface tension (energy) of liquids. This theory is also supported by abundant data.

In the Geophysical Laboratory of the Carnegie Institution of Washington at Washington, D. C., researches have been carried on in many different fields, and several publications have been issued during the year. The properties of the common refractory oxides—those of silicon, aluminum, magnesium, calcium, and iron—and of the products obtained by melting two or three of them together, as observed in the laboratory, have been summarized by Dr. R. B. Sosman. These oxides tend to unite in simple numerical proportions, regardless of what might be expected from primary valence relations of the elements concerned. The resulting products thus appear to be essentially "molecular" com-

pounds, this term being used, however, in a different sense from that which it bore in the early days of chemistry. The conception of fixed valence has been of great value in organic chemistry, but is of little application in the inorganic field.

The several forms of calcium carbonate have been studied by Johnston, Merwin, and Williamson of the same laboratory. Three crystalline anhydrous forms are recognized: calcite, aragonite, and a form designated  $\mu$ - $CaCO_3$ . There is also a hexahydrate,  $CaCO_3 \cdot 6H_2O$ . Calcite is the stable form under ordinary conditions, and all the others tend to revert to it. Indeed the factors which determine the precipitation of aragonite cannot as yet be specified, although it is known to be formed through organic agencies, by deposition from hot springs, in the presence of nuclei of carbonates isomorphous with it, and in salt waters containing sulphates at ordinary temperatures. Optical, crystallographic and chemical tests have been worked out for differentiating these forms.

Still another research of chemical importance carried on in the Geophysical Laboratory concerns the reactions involved in copper sulphide enrichment, and has been reported on by Zies, Allen, and Merwin. The various minerals containing copper, iron, and sulphur have been prepared synthetically and have been subjected to the action of copper sulphate solutions, and the reactions which take place have been carefully worked out. The stable end product is in most cases chalcocite,  $Cu_2S$ .

**QUALITATIVE ANALYSIS.** In the presence of phosphates the usual schemes for the qualitative analysis of the iron and alkaline earth groups are unsatisfactory, and Robert Gilmour of the University of Edinburgh has worked out a scheme in which the alkaline earths are first precipitated by sulphuric acid and alcohol; the metals of the iron group can then be detected in the filtrate. By the use of sodium peroxide a further separation of aluminium, chromium, and zinc, which yield soluble compounds, from iron, nickel, manganese, cobalt, and magnesium which become insoluble, is effected. The iron (and phosphorus) can be separated from the other elements by the usual basic acetate method. Trials of this scheme with unknowns showed it to be satisfactory, and it certainly possesses several advantages over the one hitherto used.

Methods for the accurate, systematic qualitative analysis of cations (metals) have been worked out in considerable detail, but heretofore there has been no thorough study of anions in this manner. Weber and Winkelmann have been investigating this subject at the University of Illinois, and published during the year a scheme for the separation of the anions of group I, those yielding insoluble silver salts but soluble barium salts, comprising the halogens and the simple and complex cyanides.

**QUANTITATIVE ANALYSIS.** Perhaps the most striking feature of the development of quantitative analysis during the year has been the further extension of the use of the hydrogen electrode. In this method a spongy platinum or palladium electrode bathed in pure hydrogen gas is immersed in the liquid to be examined, the other electrode being a sample wire, and the electromotive force or potential developed is measured by appropriate electrical instruments. This method has been applied to the study of the

reaction of soil extracts by Gillespie in the U. S. Bureau of Soils and by Sharp and Hoagland at the California Experiment Station. Its most useful application is, however, to the determination of the end point in titration, where changes in the colors of indicators are inaccurate or inapplicable. Kelley and Conant of the Research Department of the Midvale Steel Co. have worked out a method of titration of vanadium with ferrous sulphate, the end point being obtained by observing changes in potential, which is very convenient in the analysis of vanadium-iron alloys. The same authors later extended the method to chromium. In order to ascertain the most favorable conditions for the precipitation of aluminium as hydroxide William Blum of the U. S. Bureau of Standards has used the same apparatus, and has found that precipitation is complete between the concentrations of hydrogen ions  $10^{-9.5}$  and  $10^{-7.5}$ , points approximately defined by the color changes of methyl red and rosolic acid. Considerable activity has also been shown in the study of indicators with reference to the hydrogen ion potential at which they show color changes, and the application of such indicators to the determination of the acidity or alkalinity of liquids, especially bacteriological culture media and various biological fluids. Lubs and Clark of the U. S. Department of Agriculture have prepared a number of sulphonephthaleins which are of great practical value in such studies.

During the year 1916 occurred the death of two eminent chemists, as follows: Harry C. Jones (q.v.), Professor at Johns Hopkins University, one of the foremost of American physical chemists, whose work on the condition of dissolved substances and related fields was of the most fundamental importance; and Sir William Ramsay (q.v.), known as the discoverer of five new elements in the atmosphere, and who proved conclusively, in collaboration with Soddy, that radium on disintegration yields helium,—the first definite instance of transmutation.

**CHEMISTRY, INDUSTRIAL.** (See also CHEMISTRY, GENERAL.) The year in industrial chemistry has been one of positive progress. Hope has yielded place to reality and results have sustained theory, not only so far as dyestuffs are concerned but all along the line. The manufacturers in the United States have greatly increased their production of coal tar dyestuffs and it is now almost sufficient to supply the home demands. The developments seem to indicate that with sufficient capital and adequate protection the United States could lead the world in its chemical manufactures. Two interesting evidences of this fact are shown in the commercial production of camphor and indigo made by synthesis in this country. The tendency of the governments of the United States and Great Britain to avail themselves of the advice of scientific experts, especially in chemistry, is also noteworthy.

**ORGANIZATIONS.** The American Chemical Society held its spring meeting at the University of Illinois in Urbana-Champaign, Illinois, during April 17th-21st, at which the new building devoted to chemistry was dedicated and appropriate addresses made. The annual meeting was held at Columbia University, New York, during September 25th-30th, contemporaneously with the second National Exposition of Chemical Industries. The total membership now exceeds

8300. The president for 1916 was Charles H. Herty, and Julius Stieglitz was elected president for 1917.

The American Electrochemical Society held its spring meeting in Washington, D. C., during April 27th-29th, and its autumnal meeting in New York City during September 27th-30th. The president during the year was Lawrence Addicks.

The Society of Chemical Industry held its 35th meeting in University Union in Edinburgh, Scotland, during July 19-21, 1916, under the presidency of Charles Carpenter. The membership was reported as 4050 as compared with 4017 last year. The retirement was announced of Charles G. Cresswell, who had served as secretary since 1884. Dr. Charles Carpenter was continued as president, and Birmingham, England, selected as the place of meeting in 1917. In lieu of presenting papers descriptive of progress made in industrial chemistry, the meetings were devoted to the consideration of papers of general interest, such as summaries of the advancement made in a given branch.

**NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES.** During the week of September 25th-30th there was held in the New Grand Central Palace in New York City, the second National Exposition of Chemical Industries, at which exhibits and demonstrations of products, processes, machinery, and apparatus applied in the chemical industries were made by leading manufacturers from the United States. The capital represented by the exposition was said to amount to \$2,750,000,000. The exhibits were too numerous to describe, but as last year the most striking feature of the exposition was its revelation of the astonishing rapidity with which an American coal tar chemical industry is being created. Formerly most of the coal tar, benzol, and ammonia liberated by the by-product coke ovens was allowed to go to waste. Now it is all recovered. There has been a remarkable growth of industries producing dyestuffs, explosives, photographic chemicals, synthetic medicinals, flavors, and perfumes from coal tar. Most of the new companies engaged in building up the American coal tar chemical industries displayed their products in the exposition. President Herty of the American Chemical Society in one of his addresses called attention to the fact that American chemists "were achieving unexampled success and that gaps were being filled rapidly. The gains made were permanent and would remain regardless of when the war ended." This applies not only to domestic dyestuffs and potash but to a large number of intermediates and other products formerly obtained abroad. Besides the demonstrations afforded by moving pictures of technical subjects, advantage was taken by the meeting contemporaneously of the American Chemical Society and the American Electrochemical Society to present the following public addresses: "Chemistry and the National Welfare," by William Crozier, Chief of Ordnance, U. S. A.; "Chemistry and Banking," by John E. Gardin; "Chemistry and Conservation," by Gifford Pinchot; and "Expanding Relations of Chemistry in America," by Charles H. Herty. This exposition was visited by twice as many persons as the one last year, and at its close plans were inaugurated for a similar exposition to be held next year. Arrangements were made to add another floor to

the exposition space, making room for several hundred additional exhibits.

**RELATIONS OF CHEMISTRY TO GOVERNMENTS.** In the United States the Committee on Industrial Preparedness of the Naval Consulting Board of the United States, under the chairmanship of Howard E. Coffin, has organized the industries of the country for national service in the event of war. A preliminary report showed that not a manufacturer had failed to respond to the call. The number of manufacturing and other plants which were registered for possible war service was about 100,000. The mobilization of industries is in the hands of 30,000 engineers, organized in State divisions, who constitute the field force of the Naval Consulting Board in this part of its work. They serve without pay. The great war has taught the astonishing adaptability of national industries when properly inventoried and organized. It has been ascertained that a dye factory, for instance, may be transformed within ten days into a plant for the production of high explosives. The Committee on Industrial Preparedness, enlisting as it has the best scientific and commercial brains in the country, thoroughly understands this and is guiding its labors thereby.

In Great Britain chemists of military age are entitled to exemption as "analytical, consulting, or research chemists" and notices calling attention to this fact were sent out in February by the London Chemical Society.

**MEDALS.** On January 21st the W. H. Perkin medal was awarded to Dr. Leo H. Baekeland of New York for his most original and valuable work on applied chemistry, and especially for his production of the new material called bakelite, formed by the action of formaldehyde on phenols. The William H. Nichols medal for distinguished research work was awarded on March 12th to Dr. Claude S. Hudson of the U. S. Bureau of Chemistry. The Willard Gibbs medal of the Chicago Section of the American Chemical Society was on May 19th presented to Willis R. Whitney of the General Electric Company of Schenectady, N. Y., for his researches on the application of chemistry to electric lighting. In Great Britain the medal of the Society of Chemical Industry was given to Charles F. Cross on July 19th for his conspicuous services to industrial chemistry, notably for his researches on fibres, in which his work is classic.

**METALS.** *Cerium.* This rare metal, which is used for gas-sparking devices, is now reported available from American sources. *Magnesium.* Metallic magnesium, now on the market, is said to be made in the United States. *Manganese.* The production of this metal has increased threefold since the cessation of its export from Russia to the United States. Its price has largely increased owing to the demand for the dry battery and flint glass industries. *Nickel.* The output of nickel ore from the great districts at Sudbury, Canada, has been smelted by the International Nickel Co., at its plant in New Jersey, but since the war, and especially during the year, it was seriously agitated as to whether it would be best for the Canadian government to take over the deposits and require their refining at home. *Platinum.* The announcement of the discovery of deposits of platinum, chromium, and nickel in Spain has been corroborated by the Spanish government, under whose directions they will be worked. These deposits are said to be

very rich and it is hoped that the new source of supply will cheapen the price of this valuable metal. *Tin.* Tin ore from Bolivia is now imported into the United States and refined at works that have been erected at Perth Amboy, N. J. The output of this plant began in May with three tons a day and in August reached 10 tons, with promise of even greater quantities. It is claimed that the fineness of the tin runs about 0.994. The only impurity of any consequence is lead, and in a week's run this amounted to only 0.0025. The ore is the dioxide and after smelting is refined electrolytically. *Tungsten.* Until the war began the sources of tungsten were chiefly in Germany, where the ore was refined, but deposits were discovered in California in 1913 and are now being worked, and in July a mill of 300 tons daily capacity in Inyo County was turning out the metal. In Great Britain the supplies from British colonies have been taken over by the government and are now being worked in England so as to supply the demands for high-speed steel and for electric light bulbs. New deposits of tungsten and molybdenum are reported from Chile.

*Iron and Steel.* A new method of producing pure iron is announced by Trygve Yensen of the University of Illinois. It consists of melting electrolytically refined iron in a vacuum, thus reducing the impurities far below any point previously reached. The magnetic property of this vacuum-fused iron is as remarkable as its purity. Its maximum permeability, i. e., measures of ease with which it can be magnetized, was found to be several times higher than for the best magnetic iron or iron alloy previously produced. The annual saving to the electrical industries of the United States by application of this discovery will amount to nearly \$20,000,000, if it should be found that the iron can be produced at the same expense as the iron now used. A process for extracting ferro alloys of manganese and silica from slag, which it is claimed will result in large saving to steel manufacturers, has been discovered by George A. Hays of Sewickley, Pa., and George D. Lain of Elmira, N. Y. Ferromanganese and silica are essential elements in the manufacture of steel, but since the start of the European war both have greatly advanced in price. As a result of the new process, slag, which has always been practically a waste product, will now become of economical value. The substitute for manganese in the manufacture of steel, the discovery of which by German chemists was announced from Berlin in February, is proving entirely satisfactory and the output is being rapidly increased, according to a bulletin issued by the War Committee of German Industry. Dr. P. H. Dudley announces that after 40 years' research, he has found the cause for flaws in steel rails which has resulted in so many railway accidents, to be due in part to an occasional hot rail being cooled so rapidly by the rolls and their pressures to elongate the bar, or chilled by gusts of air before recalcence in the hot beds, as to cause a lag of some of the transformations of the metal in the interior of the head. These conditions can be avoided and will be in future, thus removing a distinct cause of railway accidents. See METALLURGY.

*Potassium.* The shortage in the amount of potassium salts required for domestic consumption was referred to in the YEAR BOOK for 1915 (page 132) and the efforts made to meet the de-

mands were mentioned. Since then the situation has not improved materially. The United States Geological Survey reports that "every clew that might yield valuable results has been followed up in a country-wide investigation extending from New York to California." Great activity has been manifested in experiments for the recovery of potash from the silicate rocks, such as feldspar and leucite, from mica sericite, and from green sand. In many laboratories researches have been in progress, some of which offer prospects of profitable commercial development if feldspars and other potash-rich rocks in sufficient quantity and purity can be found and made available. Manufacturers of Portland cement, in view of a possible revenue from by-product potash, have not been slow in investigating their raw material. A company near Hagerstown, Md., is reported to be installing a plant for the recovery of potash salts. (See also under CEMENT.) It was also reported that potash was recovered as a by-product from the manufacture of Portland cement in Riverside, Cal. By-product potash from this source has yielded a considerable revenue, owing to the high price for potassium salts, and in obtaining it two other purposes have been subserved,—the saving of additional material to be converted into cement, and the elimination of the dust nuisance. Reports of activity in the recovery of potassium salts from the brines and muds from western Utah have been received, as well as similar reports from deep holes sunk in the deserts of Nevada and in the Panhandle of Texas. Also further progress in the increased use of kelp as a source of potassium salts has been received from the western coast. In Leeds, England, an investigation of banana stalks as a source of potassium salts revealed the fact that over 4000 stalks came into Leeds every week which when dried yielded 1340 pounds of matter as rich in potash as kainit, i. e., 188 pounds of dried matter contained 13.7 per cent of potash, or 54 pounds of ash containing 47.5 per cent of potash. Reports of the discovery of extensive deposits of alunite in British Columbia are of importance. Analyses of samples showed the presence of nearly 5 per cent of potassium oxide. The raw material has been used to advantage as a fertilizer and the roasted mineral gave double the yield in increasing the crops when experimental comparisons were conducted on similar tracts of ground. Of passing interest was the announcement in September of the discovery in Cuba of large deposits of minerals containing soluble potassium salts. Samples that were analyzed showed as high as 12½ per cent of soluble potassium salts. Later investigations made by an engineer of the Cuban government showed that the deposits did not contain sufficient potassium salts to make the working of the claims commercially profitable.

*Sodium.* A new market for the manufacture of sodium carbonate and sodium silicate has been patented in England. The process is described to be essentially as follows: Previous attempts to produce sodium carbonate containing five molecules of water have yielded a salt which would cake into bricklike hardness, even when ground into fine powder. In this process a mixture of 106 parts of 58 per cent alkali and 90 parts of water is introduced into a Pfeleiderer machine, which is kept in motion at a determined speed. As a result an absolutely stable carbonate, containing five molecules of water, is obtained in

the form of a powder which shows no tendency to cake. It does not absorb moisture from the atmosphere, nor does it effloresce. For the manufacture of bleaching sodas containing sodium silicate, this powder is mixed with the required quantity of powdered silicate, made by the process described further on. The mixture never cakes, is always ready, and is easy to use. It serves admirably in the manufacture of scouring powders and soap powders. For all purposes requiring the use of soda the new product gives excellent results. It is not so caustic as ordinary 58 per cent alkali. It dissolves more readily than other forms of soda, and is easily handled. The process of making the sodium silicate is as follows: Silicate glass is introduced into a pulverizing machine with a certain amount of water. This amount depends upon the strength of the sodium silicate desired. The revolution of the machine brings about a gradual pulverization and hydration of the silicate. After the operation has continued for a time the contents, which resemble milk in appearance, undergo special treatment causing solidification. This solid form of sodium silicate can be easily ground into powder. It can also be prepared in a liquid or gelatinous condition. It is neutral and the solution can be concentrated to any required point. The solid silicate can be packed in crates or boxes. Among the uses of sodium silicate, in which such an improved form of preparation offers distinct economy, are the manufacture of concrete and artificial stone; of fire clay; of grindstones and emery wheels; of acid-resisting cements for jointing, insulating purposes, and waterproofing walls; of fireproofing; of steam-pipe covering; of asbestos slates, uralite, etc.; in the textile trade as a sizing, bleaching, or fixing agent; as a very valuable detergent and scourer; for rendering fabrics incombustible; as a sizing material for paper; for water paints and enamels; for drain-pipe cements; as a detergent and filling agent in soaps; for preserving eggs.

*NITROGEN.* At the very end of 1915 the Southern Electrochemical Company announced the commercial production of nitric acid from the air at its works at Great Falls, S. C. The principal use of this nitric acid at present would naturally be in the manufacture of nitrates, used so largely in the manufacture of explosives and of artificial fertilizers. Early in the year the president of the Du Pont Powder Co. made a proposal to the War Department to negotiate a contract under which the company would begin the construction of a plant under such units and magnitude as should be agreed upon, the Du Pont Company to furnish the capital. It was estimated that the cost of such a plant would involve an investment of \$20,000,000. The Du Pont Company also announced that it owned the arc process, as used in Norway, for the manufacture of nitric acid from the air. The Naval Consulting Board in March adopted a resolution calling attention to the fact that the synthetic production of nitrogen products, which was so successfully carried on abroad but not in the United States, was immediately vital to the agricultural and military interests of this country, and that therefore efforts should be made for the synthetic production of nitrogen by the government. Accordingly an appropriation of \$20,000,000 was made by Congress for the erection of a plant somewhere between the Allegheny Mountains and the Sierra Nevadas, in the interior of the country so as to be situated at

a safe distance from either sea coast. In May the announcement was made of the incorporation of the Air Reduction Company with a capital of \$2,500,000 for obtaining both liquid oxygen and liquid nitrogen from air by the process invented by Georges Claude, a French chemist. (See "The Sources of Nitrogen Compounds in the United States," by Chester G. Gilbert, *Smithsonian Miscellaneous Collections*, No. 2421, 1916.)

**BROMINE.** The entire photographic trade has suffered seriously from the lack of bromine for use in the manufacture of the bromides employed in the production of photographic chemicals. The scarcity of bromides for use in therapeutics has been felt also by the medical profession. The announcement is made that the bromine wells near Pomeroy, Ohio, and Mason City, W. Va., have been put into active commission, after remaining idle for years. The monthly production will be five or six tons. This amount will lessen the present shortage. It is probable that American manufacturers of bromides will be able soon to meet the normal demands of domestic consumption.

**FUEL.** In Sweden an investigation as to the use of peat-powder as a fuel for locomotives resulted in a report showing that it had a fuel value compared with that of coal of about two to three. The ratio of peat-powder will probably be greater when it has been used and experimented with further. Therefore it is desirable to use peat-powder, especially as the native resources will be utilized. An appropriation has been asked for the erection of a peat-powder factory at the Hästhagen bogs and for the use of enough locomotives for peat-powder so that all the trains on the Falköping-Nassjö line may use this fuel. Not only has improvement been made in Hawaii in the extraction of sugar from the cane, but savings have been effected in reducing the losses from other sources, as waste molasses and press cake. Formerly nearly 80 per cent of the exhausted molasses from the Hawaiian factories was thrown away as useless. Furnaces are now being installed which burn this molasses, the heat going to furnish steam for the factory; and the ash from the molasses, which contains 33.32 per cent potash and 4.60 per cent phosphoric acid, is used as fertilizer.

**FERTILIZERS.** The great demand not only in the United States but elsewhere for artificial fertilizers is so largely a matter of the different ingredients of such fertilizers, especially potassium salts that the subject has received treatment under *Potassium*. Nevertheless various materials have come into use as artificial fertilizers which may be mentioned. Seaweed which is rich in potassium salts, nitrogen, and phosphoric acid is used in Nova Scotia and efforts are being made by the government to find a method by which seaweeds may be dried and ground economically. In Manchester, England, the municipal authorities have undertaken the experimental manufacture of bacterized peat or "humogen," which was discovered by W. B. Bottomley. (See YEAR BOOK for 1915, page 133.) In Spain where common salt is obtained from sea water by evaporation the mother liquor containing potassium and magnesium salts is now recovered as follows: The mother liquors from the salt gardens are run into tanks and submitted to further evaporation. After a certain amount of the solids present have been deposited the residual liquor is evaporated to dryness by a special

process. The solid residue thus obtained closely resembles in composition the mineral kainit. It contains about 12 per cent of potash. An interesting application of chemistry to agriculture is shown by an investigation carried on by the Hawaiian Experiment Station which showed that soil containing manganese rendered insoluble the iron needed for the best growth of the pineapple. The injection of a hypodermic needleful of iron sulphate solution quickly improved the pineapple and now the best means of making the iron salts available are being studied. See FERTILIZERS.

**PAPER MAKING.** The continued and growing scarcity of paper stock, especially of quality for newspapers, has resulted in increasing search for a satisfactory material. In July came the announcement from Germany that after experimenting on various materials an excellent quality of paper had been made from cotton stalks. This probably led to the advocacy in the Southern States of the use of cotton waste and stalks as material for paper stock, but the experts from the Department of Agriculture pointed out that in 1908 it had been shown that while cotton stalks were sufficiently "woody" for the purpose, it was doubtful whether any attempt at making paper from this material would be commercially successful. Cotton stalks are more fibrous than corn stalks from which a fair grade of paper can be made. Later the Department of Agriculture issued a bulletin describing the use of hemp hurds (the waste stalk fragments produced in preparing hemp fibre for market) for making paper. The bulletin itself was printed on paper made from hemp wastes. The paper, which was the first ever made in the United States from hemp, was described as "of good body, clear white cream texture, and very satisfactory calendered finish." The Bureau of Science in the Philippine Islands has continued its studies on the suitability of bamboo, cogon grass, abaca, and various palm fibres for paper pulp. In India kaing grass has been found satisfactory for making paper. It is comparable to esparto grass, and it is cheaper. Paper pulp manufactured from wood in Japan is now being imported from that country to supply needs in the United States. The manufacture of coal from waste material of paper factories—an industry which promises to reduce the cost of both paper and coal—is described as follows: The lye is mixed with some foreign material after boiling the sulphite, and then transferred to a large kiln, where it is boiled again under high pressure. During this process the lye is changed and the substance which is converted into coal, sinks to the bottom and is taken out in the form of a thick black paste. The water which remains in the paste is then removed in a centrifugal machine and the residue is the coal in a powdered form. The powder can be made into briquets and used in the same manner as coal. Under the sulphite process in paper-making only 45 per cent of the weight of the timber is utilized. The remainder falls as refuse into the lye and it is this that is transformed into coal. The announcement is made of a new process for making paper by Wallace P. Coho, who has taken pattern from the silkworm, by providing that finely woven cotton cloth be treated and locked in by viscose; hermetically sealed in artificial silk. This is a permanent product and the result is a paper of varying thickness according to the weight of the cotton cloth used and the nature of its covering. The

paper is easy to write upon, agreeable to the touch, and should endure for several hundred years without change. A new textile from Germany in which paper is spun with about 20 per cent of cotton is described as follows: Unspun cotton in the form of down is glued to one side of endless rolls of paper, and the paper is then shorn into narrow bands which are spun with the cotton side outward. Paper underclothing, jerseys, sheets, bandages, and horse blankets have been made, but the cost of production is too great to allow of its competing with cotton or woolen cloth.

**SYNTHETIC CAMPHOR.** During the year ending June, 1916, there were imported into the United States 4,574,430 pounds of camphor, valued at \$1,236,172, and also 1,866,154 pounds of synthetic camphor, valued at \$619,320; all of which came from Japan where the price of slab camphor increased from \$23.15 a 100 pounds in 1915 to \$33.36 for the same quantity in 1916. Accordingly the American Camphor Corporation began the operation of a factory in Philadelphia, Pa., for the production of synthetic camphor. Whether this is but a temporary effort remains to be seen, but it is the beginning of a new chemical industry in the United States.

**PHOTOGRAPHY.** A method of printing silk fabrics by color photography, announced in October, consists in making three successive impressions—blue, yellow, and red—from three selected photographic prepared plates. The fabric is rendered sensitive by mixtures of alkaline phenols and diazo sulphites, products which possess the property of giving coloring matters only through the influence of light. The precision needed in superposing the three impressions is secured by carrying out the work on a special frame, the fabric having been previously provided with metallic eyelets to avoid tearing it. The development of the colors is accomplished with better regularity by exposure to electric light. The method is recommended as more especially applicable in the treating of articles that cannot well be printed by machine. From Rome, Italy, comes the simple statement of an important scientific discovery of a method of photography reproducing natural colors, found after eight years of experimenting.

**COTTON SUBSTITUTES.** The Germans have shown great ingenuity in the development of substitutes for articles available only by importation. The impossibility of obtaining sufficient cotton, so necessary in the manufacture of explosives, in surgery, etc., led to the use of various substitutes as was indicated in the *YEAR BOOK* for 1915 (page 136). During the year the experiments by Oswald Richter, of Vienna, have resulted in obtaining the fibre from nettles. Previous experimenters had followed the methods used with other plants but had failed to obtain satisfactory results. Richter found the reason. Nettles contain much fruit sugar, which is all steeped out during the first half day that the plants lie in water; and then a fermentation process sets in which is due to the development of bacteria that feed upon the sugar and then destroy the value of the fibre. After Richter established these facts, he had only to draw off the water after soaking the nettles for 12 hours, and then turn on fresh water. Then another class of bacteria, which do not attack the fiber, is developed, and retting proceeds as normally as with flax. The machinery for separating fibre and

stalk is the same as for hemp, and existing spinning and weaving machines are used in making nettle cloth, with a few minor changes. The cloth is now being made in Austria. About 1000 tons of the fibre were produced there last year under the auspices of the government, which turned it over to various factories to be worked up. It is asserted that the fibres are from 2 to 12 inches long. After having been washed in a soap solution they are very soft and produce a cloth having a fine lustre. The yarn is pronounced considerably stronger than flax yarn, hence nettle cloth should prove remarkably durable. While the supply of wild nettles in Germany and Austria is practically inexhaustible, it is probable that it will be necessary to cultivate the plant in order to get the best results.

**MOTOR FUEL.** The great demand for gasoline as a motor fuel as well as its increasing price is giving rise to various substitutes. Of those used in Great Britain the new Lightning Motor Fuel has been found acceptable. It consists of 50 per cent gasoline and 50 per cent of chemicals, the nature of which is secret. Its cost is about one-half that of gasoline. Another substitute is an intermediate between gasoline and oil and can be stored like oil. It also is cheaper than gasoline but the car must be started with petrol and then may be run with the substitute. A third variety of secret composition, one ingredient of which is wood spirit, is much used. The Germans have found an alcohol-benzol mixture consisting of one part benzol and one to five parts alcohol most satisfactory. Difficulty is had with the starting of the motor as is the case with the English substitute. The cost of this mixture is less than gasoline and it will survive the war. At the meeting of the American Chemical Society, held in New York City in September, this subject was discussed and alcohol from various sources, such as sawdust and molasses, was suggested with explanations of special methods required for its extraction. Natalite is a product made in Durban, Natal, and consists of 60 per cent alcohol from molasses and 40 per cent ether. In Sweden peat is used for producing liquid fuel, and a novel form of retort has been constructed that is capable of extracting five times as much gas from a ton of bog peat as is at present obtained from a ton of gas coal. The possibilities of this new invention are enormous; for the gas obtained from peat possesses almost as high calorific power as coal gas and it is found to be unusually rich in benzol and ammonia. See **AUTOMOBILES**.

**ARTIFICIAL RUBBER.** At the close of 1915 Chancellor Bethmann-Hollweg announced to the Reichstag that German inventors had discovered a method of producing synthetic rubber. Later came the information that the Department of Finance in Russia had found a chemist in Moscow who was able to make synthetic rubber with alcohol. It was claimed that rubber could be made by him from certain vegetable oils, such as hemp-seed oil and rape-seed oil with alcohol, and the necessary alcohol was readily available from the enormous quantity of vodka that had been stored by the government since the decree has been issued forbidding its use. In consequence, the Department, keenly alive to the possibilities of this discovery, which not only solves the problem of the disposal of vodka, but also relieves the famine in rubber, decided to begin the manufacture of the rubber by this process as

soon as arrangements could be made with the inventor. An experimental plant was at once constructed.

**NEW PROCESSES FOR COAL AND PETROLEUM PRODUCTS.** Referring back to the discussion under this head in the YEAR BOOK for 1915 (page 134) it may be well to add from reports made to the United States Geological Survey, by all of the by-product coke plants in the United States showing that the output of benzol and other light oils in 1915 amounted to 13,942,763 gallons, in connection with which there were produced 761,256 pounds of naphthaline, a solid crystalline substance. Thirty-one coke-making establishments with 4933 by-product ovens contributed to this total, and it is estimated that between 8,000,000 and 9,000,000 tons of coal were carbonized in the ovens that furnished the gas from which the oils were recovered. The annual capacity of the benzol-recovery plants now in operation is estimated at more than 20,000,000 gallons, and with the completion of plants now building, will probably exceed 22,000,000 gallons. In May the United States Senate adopted a resolution authorizing the Secretary of the Interior to receive assignments from Walter F. Rittman of his patent, which is expected greatly to increase the yield of gasoline. The process may be leased only to persons or firms who will agree that if they discover any improvements to it, they will give them to the United States instead of patenting them for themselves. Estimates given out in June by the Bureau of Mines, on the first returns from the new Rittman process plant at Coraopolis, Pa., indicate that the cost of producing gasoline by this method ranges from 7 to 13 cents a gallon, according to the price of crude material. Twenty different concerns have taken out licenses from the government for the installation of the Rittman process, which by "cracking" the heavier residuum oils of petroleum distills them into volatile ones. Two of the licenses are already producing oil by the process. Dr. Charles S. Palmer of the Mellon Institute of Pittsburgh, Pa., patented in June an improved process that consists of extracting gasoline from petroleum residues which have practically no volatile matter below a temperature of 300 degrees centigrade. When they are subjected to this temperature, under conditions prescribed by the process, about 75 per cent of their composition becomes volatile, and of this about 20 per cent is gasoline. The basis of the process is said to be the inter-related control of temperature, pressure, and time, these factors being so applied that recomposition of the elements in the petroleum residue results, one of the recomposed products being gasoline. See "Manufacture of Gasoline and Benzene-toluene from Petroleum and Other Hydrocarbons," by W. F. Rittman, C. B. Dutton, and E. W. Dean, with a bibliography compiled by M. S. Howard, (*Bulletin 114, Bureau of Mines*, 268 pp., Washington, 1916). Also see "The Role of Chemistry in the War," by Allerton S. Cushman in the *Journal of the Franklin Institute* for February, 1916.

**DYESTUFF SITUATION IN THE UNITED STATES.** Continuing the information discussed under this heading in 1915, it may be said that in February there was a conference on the dye situation held in Washington in the office of the Secretary of Commerce, at which it was agreed that "a serious shortage of dyestuffs exists, and that in spite of the fact that the domestic manufac-

turers of dyestuffs are now producing more dyestuff materials than ever before, and their output is growing, the production is scarcely as yet sufficient to meet more than one-half of the demand, and that the variety of colors now produced by the domestic manufacturers of dyestuffs is limited. A very large proportion of the domestic output consists of blacks and of the more easily manufactured colors." The conference also agreed to bring to the attention of the public in every way possible the need of cooperation between the consumers of dyestuffs and between the manufacturers of textiles and clothing on the one hand and the consumers of these goods on the other. The expert of the Bureau of Foreign and Domestic Commerce, Dr. Thomas H. Norton, continued his splendid campaign of conveying information to both manufacturers and consumers during the year. In September he reported that "two years ago a single firm made aniline on a small scale, while six companies produced artificial dyestuffs from intermediates imported from Europe. To-day 18 companies are manufacturing synthetic carbolic acid, and over 40 are producing aniline and other intermediates. Over 30 companies are making coal-tar dyes. The total number of operatives in this branch two years ago was 400; now single establishments employ 1000 workmen. In 1914 we made one-tenth of the synthetic colors consumed in the United States by 'assembling' foreign semi-manufactured colors formerly required by our textile, paper, and other industries, and now every pound is made from American coal tar." As corroborating this statement the following extract from the Bureau of the Census may be added: "The recovery of coal-tar 'crudes' from the by-products of coke plants has now been so perfected that the output is more than sufficient to cover the needs of a national color industry. Two years ago the annual output of these crudes was estimated as follows: Benzol, 9600 short tons; toluol, 3200 tons; naphthaline, 1500 tons; and phenol, 75 tons. To-day the estimated annual output is: Benzol, 90,000 tons; toluol, 22,440 tons; naphthaline, 12,500 tons; phenol (chiefly synthetic), 10,000 tons." Concerning dyestuffs the report shows that in 1909, 124 plants turned out \$16,788,676 worth of products, and in 1914, 133 plants produced \$21,741,122. During the year Dr. Norton devoted much attention to the preparation of a census of artificial dyestuffs which consisted essentially of a detailed statistical study of American dyestuff imports, proof-sheets of which giving in detail information as to the 5674 different brands of synthetic dyes that were imported into the United States during 1913 and 1914, were shown at the Exposition of Chemical Industries; but "at the behest of German dyestuffs importing interests" they were withdrawn, although later publication was ultimately promised by Secretary Redfield, and it appeared in November. The impossibility of obtaining synthetic indigo from Germany has led to the revival of the natural industry in India where efforts are now being made under scientific direction to obtain the maximum yield of indigo at the lowest cost so as to secure a permanent market for that dyestuff. On the other hand synthetic indigo is now being made in the United States to meet the increasing demand for this coloring material, which prior to the war was imported from Germany. An interesting feature of the progress of this industry was manifest by

the statement published in July that American manufacturers of coal tar and natural dyestuffs are adding to the foreign trade of New York at the rate of over \$200,000 a month. Detailed statistics of May exports showed that the value of colors of all kinds sent out in May totaled \$594,096, against \$380,612 in April. It was said that foreigners were paying pretty stiff tribute to domestic makers for the much desired dyes. Another incident of interest is the statement generally made that the German submarine *Deutschland* brought to the United States in July a cargo of chemicals and dyestuffs of sufficient value to have paid the cost of the building of the submarine. Less spectacular, but still of marked interest, has been the evolution in the use of natural dyestuffs by American manufacturers. The Bureau of the Census reports a domestic output of such dyes in 1914 valued at \$1,866,000. The chief constituent was logwood extract, amounting to 14,500 short tons, and valued at \$1,312,000. This represents an increase for this dyestuff of 32 per cent over the production of 1909. Other natural dyestuffs (quercitron, fustic, cutch, archil, etc.) increased in value from \$144,000 in 1914 to \$544,000 in 1915, or 285 per cent. The production of such mineral colors as chrome yellow, orange, and green, iron buff, Prussian blue, ultramarine, etc., amounted in 1914 to 2500 short tons, valued at \$594,000. The increase in the value of the output during the quinquennial period was 52 per cent. There has been no very noteworthy increase since 1914 in the manufacture of these wares, except of ultramarine, for which there had been a considerable dependence upon European sources prior to the war. See *Hearing to Establish the Manufacture of Dyestuffs Before the Committee on Ways and Means, 64th Congress, First Session* (248 pp., Washington, 1916). Also the "Dyestuff Situation in the United States at the Close of 1915," by Thomas H. Norton (*Journal of Industrial and Engineering Chemistry*, February, 1916).

**THE DYESTUFF SITUATION ABROAD.** From Great Britain comes the report that the British Dyes Company at Huddersfield is active and that new buildings were already needed. As England formerly sent the raw materials of aniline dyes to Germany to be returned as the finished product, so now she is sending raw materials to Switzerland and many British dye-users have signed contracts to continue the import of Swiss dyes after the war is over. So that while aniline dyes are being made in smaller factories in England they are also being imported from Switzerland in unprecedented quantities. However, the difficulty of obtaining adequate supplies of aniline colors has given a strong stimulus to the utilization of natural dyes. Dyestuffs in use prior to the advent of chemical dyes are receiving considerable attention. The sources of supply as well as the practical adaptability of such products are being subjected to careful analysis with a view toward more extensive use. Natural coloring matters susceptible of replacing synthetic dyes are eagerly sought. The opinion is expressed that a large and permanent trade in South and Central American natural dyestuffs, such as logwood, fustics, quercitrons, quebracho extracts, and hematines, could be built up with British industries if the proper steps were taken at the present juncture in connection with prices and deliveries. It is largely through the substi-

tution of natural tinctorial products and vegetable dyes of South America and India that the present deficiency in synthetic dyewares is being overcome. These conditions have naturally resulted in the advancement of prices for dyeing, sizing, and tinting. The general trend shows that in the future Great Britain will largely break away from its dependence on Germany and other countries so far as dye and fine chemicals are concerned.

From Switzerland the outlook is more satisfactory, for the Society of Chemical Industry in Basle reports that after laying aside \$535,000 as against \$175,000 last year, for depreciation, and the sum of \$195,000 for pensions for workmen, there was a net profit on the year's operations of \$496,000, as against \$350,000 the year before.

From France the shortage of dyestuff supplies is reported. Of greater import than any one factor in the conduct of the silk industry has been the dyestuff supplies. All the stocks that had been seized by the government at the outbreak of the war and distributed under the direction of the minister of war have been exhausted, and, while several organizations created research bureaus for the making of dyestuff factories and substitutes for German products, no material progress was made, and therefore the outlook is not bright. Should the war last much longer there is no doubt that the United States will have to furnish all the dyes or ingredients necessary for the few colors that are now being used in the Lyons silk industry.

In Germany the large chemical industries, on account of their adaptability to war conditions, have been able to declare large dividends. Notwithstanding the fact that the general conditions of the industry are regarded as satisfactory, the aniline color manufacturers, on account of the loss of the export trade, are not in a favorable condition. The prospects, as they appeared from orders coming at the close of 1915, were expected to improve in 1916. Notwithstanding efforts to content themselves with domestic orders, the diminution of exports is felt throughout the whole industry.

The Japanese were quick to take advantage of the situation and the encouragement given by the Japanese government to the manufacture in Japan of synthetic dyes and medicines has resulted in the formation of a company capitalized at nearly \$4,000,000, the capital stock of which was oversubscribed 870 times. Later it was reported that all the by-products of the Government Iron Works, the Mitsui Mining Co., the Mitsu Bishi Co., the Tokyo Gas Co., the Osaka Gas Co., and other factories were being fully used. The supply of coal tar exceeded 60,000 tons. In its distillation many large commercial interests were engaged. The foremost of these is the Nippon Dyestuff Co. It profits from government protection under the law for the encouragement of chemical and dyestuff industries, although the concern is still far from being in large operation. Gas companies in Osaka and Tokyo have taken up the manufacture as a subsidiary branch, as they have a good supply of coal tar at their disposal. Aniline salt and induline are marketed by the Tokyo Gas Co. The Mitsui Mining Co. has succeeded in producing a variety of dyes from coal tar by its works at Miike. Later this company hopes to extend the list of its products so as to include additional deriva-

tives of benzol, carboic acid, salicylic acid, and picric acid. Besides there are many minor enterprises engaged in this branch, including the Osaka Chemical Industry Co. and the Kobe Seikyo. These produce several artificial dyestuffs and are contributing much to the rapid development of the important new industry in that country. In July a report was issued showing the exports of dyestuffs from New York. It gave the following items: Italy, which in April was the largest buyer of American colors, in May yielded first place to Russia, which took colors worth \$260,720, Italy coming next with \$105,645. Color exports to Russia in Asia for May were \$3300. English requirements in May were \$62,516. In spite of the disturbed conditions in Mexico, color shipments to that country in May were \$41,500. France's share in May trade was \$29,587, and that of Spain was \$24,251. Brazil took colors worth \$13,334, Argentina \$13,172, and Chile \$5904. Portugal received \$11,177 worth of dyes in May, while Greece's purchases were valued at \$7027. Scottish shipments amounted to \$3443, British India \$1240, and Japan \$722. Australia bought American dyes valued at \$1281, while fair purchases were made by Cuba and other West Indian Islands.

**ASPHYXIATING GASES.** The information given under this heading in the *INTERNATIONAL YEAR BOOK* for 1915 (page 136) has been added to by reports from England in which it was claimed that the irritating influence of these gases is largely due to "Sabadilla," a plant of the lily family, botanically called "*Veratrum sabadilla* Retz." that occurs only in Venezuela and Mexico. The highly-poisonous seeds have long been used in medicine. The substances produced from sabadilla seed are cavadine, an alkaloid; veratric acid; and sabadalline. The last is an amorphous, pleasant smelling alkaloid that accelerates the beating of the heart. Sabadilla powder is used by cattle raisers in Venezuela as an insecticide with excellent results. It is said that in Europe it is used in the manufacture of disinfectants, and that in the Balkan states and Russia it is employed in tanning fine leathers and as a mordant for dyes.

**CHENEY, CHARLES EDWARD.** Senior bishop of the Reformed Episcopal Church in America, died Nov. 15, 1916, in Chicago. He was born at Canandaigua, N. Y., in 1836. After graduating from Hobart College in 1857, he studied at the Alexandria (Va.) Theological Seminary, and was ordained in 1858. From 1860 till his death, he was rector of Christ Church, Chicago, except for a short period just after he had been deposed from the priesthood for refusing to use the word "regenerate" in the baptismal offices. Dr. Cheney then was instrumental in founding the Reformed Episcopal Church, of which he became assistant bishop and afterward bishop, and Christ Church was received into the new denomination. In 1905-07 he served as president of the Synod of the Reformed Episcopal Churches of the Middle States. He was the author of religious and historical works, including *What Do Reformed Episcopalians Believe?* (1888) and *The Second Norman Conquest of England* (1907).

**CHESS.** The Rice Memorial masters' tournament held in New York City was the feature of the year 1916 in chess circles. J. R. Capablanca proved the victor, winning 14 games and losing 3; D. Janowski of Paris finished second with 11

victories and 6 defeats, and O. Chages of New York City third with 10½ victories and 6½ defeats. Other results were: B. Kostic, Budapest, won 10, lost 7; A. Kupchik, New York City, won 10, lost 7; J. Rosenthal won 7½, lost 5½; J. Bernstein won 7, lost 6; A. W. Fox won 7, lost 6; A. Schroeder won 5½, lost 7½; R. T. Black won 5, lost 8; A. B. Hodges won 5, lost 8; I. Tenenwurzle won 3½, lost 9½; F. K. Perkins won 3, lost 10; N. W. Banks won 2, lost 11.

In the Rice Memorial international problem tourney, C. Promisio, Philadelphia, K. Grabowski, Warsaw, Russia, A. M. Sparke, Lincoln, Eng., Valentin Marin, Barcelona, Spain, and J. Rietveld, Kesteren, Netherlands, divided first, second, and third prizes. The contest in the three-move section also resulted in a tie between Emil Palkoska, Prague, Austria; Godfrey Heathcote, Arnside, Eng.; Valentin Marin, Barcelona, Spain; H. F. L. Meyer, London, Eng.; and J. Willner, Kishinev, Russia. Henri Rinck, Barcelona, Spain, and H. J. A. Drevitt, Oxford, Eng., tied for first in the end-game section.

J. R. Capablanca established a marvelous record during the year in a tour of the leading cities of the United States. He won 404 games, lost 5, and drew 10. Credit also should be given to Boris Kostic who, blindfolded, played 20 opponents at the Rice Progressive Chess Club, New York City, winning 19 games and drawing 1, in 6 hours, 11 minutes.

The Manhattan Chess Club won the championship of the Metropolitan Chess League, having a clean slate in six matches. The Rice Progressive Club finished second, and the Brooklyn Chess Club third. Columbia University again captured the inter-collegiate championship with 8 victories and 4 defeats. Yale was second with 6½ victories and 5½ defeats, Harvard third with 5½ victories and 6½ defeats, and Princeton last with 4 victories and 8 defeats.

A world's record for simultaneous play was made by F. J. Marshall, who out of 95 games won 80, lost 8, and drew 7.

**CHICAGO, UNIVERSITY OF.** A non-sectarian educational institution at Chicago, Ill., founded in 1891, largely through gifts made by John D. Rockefeller. It has since been greatly indebted to Mr. Rockefeller for its maintenance. The total registration in all departments of the university in the fall of 1916 was 4881. During the academic year 1915-16 it was 8510. On the teaching staff were 334 faculty members and 102 assistants. During the year Prof. J. Lawrence Laughlin, head of the department of political economy, retired. The following new appointments were made: Jean Piccard, of the University of Lausanne, Switzerland, as assistant professor of chemistry; E. W. Burgess, Ohio State University, assistant professor of sociology; Frederic C. Woodward, dean of Leland Stanford University, professor of law; H. A. Millis, of the University of Kansas, associate professor of political economy; Nathaniel Butler, dean of University College. During 1916 the university received property valued at between \$2,000,000 and \$2,500,000, from Hobart W. Williams of Chicago. Eventually the income from this gift will be devoted to assisting deserving students and to instruction in commercial and business studies. Ida Noyes Hall, built at a cost of nearly \$600,000, from funds largely contributed by Laverne Noyes, was dedicated in June, 1916.

It is being used as a club-house, gymnasium, and hall by women students. An anonymous donor gave \$200,000 for the divinity school. What John D. Rockefeller designated as his "final gift" to the university was \$10,000,000, to be paid in 10 annual installments, beginning in 1910. Of this amount, \$1,500,000 is shortly to be devoted, in accordance with Mr. Rockefeller's wishes, to the erection of a chapel. At the close of the spring quarter in 1916 the university celebrated its 25th anniversary. One of the most important projects ever planned by an American educational institution was announced late in 1916 by the University of Chicago. It is proposed to combine various medical institutions in Chicago, including Rush Medical College, the medical department of Northwestern University, and the medical department of Chicago University in one great central plant, under the control of the last-named institution, with the hope of making this second to none in the United States or in the world. (See UNIVERSITIES AND COLLEGES, *General Education Board*.) The productive funds of the university amount to about \$23,494,280, and the income to about \$1,292,185. In November, 1916, the library contained about 485,840 volumes. President, Harry P. Judson.

**CHILD LABOR.** The most important event with reference to the protection of child workers was the enactment of the Federal law known popularly as the Keating-Owen Bill. Some advance was made in the legislation of the Southern States, investigations were carried forward in different communities, and its educational propaganda was continued by the National Child Labor Committee.

This Committee introduced as a feature of its educational campaign a play entitled *A Pageant of Sunshine and Shadow*, written by Constance D. Mackay. This is a morality play, drawing contrasts between the lives of the children who work and those who enjoy the rights and opportunities of full development. Child Labor Day was celebrated on January 23rd by thousands of school teachers and superintendents, clergymen, women's clubs, and other organizations, as one feature of the agitation for the enactment of the Federal bill.

The Committee held a conference at Asheville, N. C., in February, the discussion having special reference to the proposed Federal law. The Southern Association of Cotton Manufacturers was represented. The conference showed that child labor is not an issue between the North and South, but between progressive people everywhere and the mill men. The sessions developed the belief that the true sentiment of the South has not yet been expressed in legislation, because three-fourths of the speakers were from the South and with few exceptions concurred in approving the Federal act and in demanding advanced legislation in Southern States.

**INVESTIGATIONS.** The National Child Labor Committee found through investigation that conditions of child labor in the sugar-beet fields of Colorado rival those of the cotton mills of the South. In the harvest season, children 6 years of age work in the fields from 5 A. M. to 7 P. M.

pulling beets, and miss on an average nearly two months of schooling each year. The amount of energy needed for the work is exhausting to a growing child, five tons of beets being topped daily by some of the child-laborers.

Drs. Lee K. Frankel and Louis I. Dublin made an investigation of 10,000 children who took out working papers in New York City between July, 1914, and April, 1915. They found that 53.7 per cent of the 10,043 children were boys, 46.3 per cent girls. Of the boys 61 per cent were English, Irish, or Scotch. Of the girls 52.4 per cent were Italians. About three-eighths of the entire group were from 14 to 14½ years of age; one-fourth from 14½ to 15 years; one-fourth from 15 to 15½ years; and a little more than one-eighth from 15½ to 16 years. Jews constituted 36.6 per cent of the total group; Italians, 18.3 per cent; native born of native parentage, 16.1 per cent; British, 10.9 per cent; Germans, 9.5 per cent. Of the girls 56.2 per cent and of the boys 59.2 per cent made use of the first opportunity, based on age and schooling, to secure working papers. Measurements of height and weight showed that the stronger children of the family were evidently chosen to be the first to go to work.

**CHILD ACTORS IN THE MOVIES.** The motion picture measure of New York passed this year largely through the efforts of the New York City Child Labor Committee is the first attempt made in any State to regulate child labor in the movies. It is an amendment to the penal law relative to the employment of minors in public entertainments and exhibits; it places children of motion picture studios on the same basis as children of the legitimate stage. Under this law a child may not be employed without the written consent of the mayor or president of the board of trustees of a village specifying the child's name and age, names and residence of parents or guardians, facts about the motion picture concern such as its name, place where child is to be used, name and character of photo play, number of hours and days to be engaged, and exact description of part to be portrayed by the child. Moreover forty-eight hours previous notice of the application must be given to the Society for the Prevention of Cruelty to Children, if there be one in the county, and a hearing held if requested.

The law went into effect in May, and until then any mother could let out her children to the management of a motion picture studio regardless of the demands on its health and strength, or the retarding of its education. Wages are good, \$1.50 to \$3 a day being the average paid. Hence there is a great temptation to the poor parent, and as almost 6.6 per cent of the cases investigated show the need for regulation, other States should follow New York in this move.

**THE FEDERAL CHILD LABOR LAW.** The Federal Child Labor Bill was introduced in Congress of 1915 as the Keating-Owen Bill, and after passing the House by an overwhelming vote, the bill was delayed in the Senate until killed by the objection of Senator Overman of North Carolina near the close of the session. In February, 1916, the bill again was passed by the House by big majority, and on April 6th was favorably reported upon by the Senate Committee on Interstate Commerce, then after some changes in the Senate, passed that body.

The bill as passed by the House prohibited the shipment in interstate commerce of the products of any establishment into which the labor of children in whole or part had entered. The Senate substitute prohibited an establishment, employing children below the standards fixed in the bill, from shipping its products in interstate commerce whether made by children or adults. Thus the House had put an embargo on the actual products made by children, while the Senate substitute closes the channels of interstate commerce to any establishment employing children under sub-standard conditions. It is agreed by the best constitutional lawyers of both the Senate and the House that the Senate bill is more clearly constitutional than the House bill. The bill becomes effective one year from date of its approval by the President on September 1st.

This law establishes a national minimum standard by excluding from interstate commerce the products of all mills, factories, canneries, workshops, mines, and quarries which violate any of the restrictions specified, but it leaves the individual State free to improve upon this standard. In so far as it broadens the freedom of action in progressive States by removing the danger that products of unregulated child labor of another State will enter its markets in competition with its more costly products, it imposes the necessity of progressive action upon the less progressive States. This is believed to be its most important effect, a stimulus to standardization of State legislation.

Section one of the law prohibits any producer, manufacturer, or dealer from shipping or delivering for shipment in interstate or foreign commerce the product of any mine or quarry "in which within thirty days prior to the time of the removal of such product therefrom children under the age of 16 have been employed." A similar prohibition applies to any mill, cannery, workshop, or factory employing children under the age of 14, or employing children between ages 14 and 16 more than 8 hours in any day or more than 6 days in any week, or after the hour of 7 o'clock in the evening, or before the hour of 6 o'clock in the morning. The law provides for an Administrative Board composed of the Attorney-General, the Secretary of Commerce, and the Secretary of Labor. This Board is authorized to prepare rules and instructions for the application of the law. A special protection for innocent shippers or dealers is inserted in the provision that any dealer may protect himself by procuring a guaranty issued by the original producer of the goods.

Much discussion centred around the 30-day clause, which seemed to permit evasion by the simple method of storing goods 30 days after production and before shipment. This possibility, however, depends entirely upon the rules established by the Administrative Board. Such rules might easily provide that "removal" should include the transportation of goods from the immediate place of production to any store-room or warehouse.

The law was expected to affect about 150,000 working children; of these one-third were employed under the age limits fixed (27,000 in factories and 17,000 in mines and quarries), and the remainder were employed more than 8 hours per day. The law was attacked by child labor legislation enthusiasts on the ground that it did

not reach at least 1,850,000 children now employed as street vendors, as cotton pickers in Mississippi, Oklahoma, and Texas, as truck gardeners in Pennsylvania, New Jersey, Ohio, Colorado, and Maryland, as domestic servants, as cash girls, and as State wards. All such, however, are beyond Congressional control since their labor is too remotely related to interstate commerce. Moreover the value of the law as a protective measure is realized when it is known that 28 States have not enacted an 8-hour law for children and 13 States permit children to work at night.

Other legislation included the enactment in February by the South Carolina Legislature of a law raising the age limit to 14 years. Georgia and Alabama had previously passed laws similar to the Federal bill in spite of the opposition of cotton mill owners. These enactments left North Carolina alone of the Southern cotton manufacturing States with no adequate protective legislation. A new Maryland law effective June 1st substituted a Board of Labor and Statistics for the Bureau of Statistics and Information; it established a minimum age of 12 years for canneries and newspaper selling; it limited the hours of all children under 16 to 8 per day, between 7 A. M. and 7 P. M., and to 48 per week. It prohibited the employment of children under 16 in work on the stage, in theatres, moving picture houses, tobacco factories, and in the operation of dangerous machinery.

**GREAT BRITAIN.** The war produced such a scarcity of labor that there occurred a very marked increase in juvenile employment in Great Britain. Juvenile Employment Committees found it impossible to meet the demands for child labor. It was estimated that 45,000 children of ages 12 to 15 in excess of the normal number permanently left school for employment in 1915. Moreover, additional thousands were given longer or shorter periods of leave from school to engage in industry. At least 15,000 were excused for agricultural employment alone. The Board of Education pointed out that these facts indicated that the education of the children of Great Britain was being arrested and that they were being exposed to severe physical strain. They recommended increased care in physical examinations and the issuance of certificates, and more complete coöperation between employment committees and school medical authorities with a view to placing children in vocations suited to their abilities.

**Bibliography.** Among the considerable volume of literature on this subject reference may here be given to the following: L. K. Frankel and L. I. Dublin, *Heights and Weights of N. Y. City Children 14 to 16 Years of Age*; T. I. Parkinon, *Brief for the Keating-Owen Bill*; W. H. Singerland, *Child Welfare Work in California*; and the reports of the National Child Labor Committee, Maryland Bureau of Statistics and Information, Massachusetts Bureau of Statistics (*Industrial Home Work in Mass.*), and the New Hampshire Department of Public Instruction.

**CHILDREN'S COURTS.** See JUVENILE COURTS.

**CHILE.** A South American republic south of Peru and between the Pacific on the west and Bolivia and Argentina on the east. Capital, Santiago.

**AREA AND POPULATION.** The area of the 23 provinces and one territory into which the re-

public is divided is officially estimated at 757,366 square kilometers (292,419 square miles). Its length from the Peruvian boundary to the southern limits of South America is about 4230 kilometers (2628 miles); its width, though varying, may be stated as approximately 285 kilometers (177 miles). The population, according to the census of Nov. 27, 1907, was 3,249,279 (1,624,221 males, 1,625,058 females). The estimated population Dec. 31, 1914, was 3,596,541. About one-fourth of the people are of pure Spanish stock, and the remainder either mestizo or pure Indian. The principal cities, with estimated 1914 population: Santiago, 397,941; Valparaíso, 187,240; Concepción, 69,776; Iquique, 45,012; Talca, 39,526; Chillán, 39,173; Antofagasta, 36,114; Viña del Mar, 30,245; Temuco, 26,172; Talcahuano, 20,641; Curicó, 19,529; Valdivia, 19,388.

The number of marriages reported for 1913 was 21,341, and for 1914 19,002; living births, 140,525 and 136,660; deaths (exclusive of stillbirths), 107,200 and 100,069; excess of births, 33,325 and 36,491. Immigration, though encouraged by the government, is small; in 1911 863, in 1912 1839; in the decade 1905-14, 25,544.

Primary instruction is free, but not compulsory, and the average school attendance is low. Public primary schools in 1914 numbered 3040 with about 318,000 pupils, and private primary schools 483 with about 57,000 pupils. There were 12 public and 7 private higher grade schools, with 2457 and 828 students; 86 public and 117 private secondary schools with about 25,000 and 17,000 students respectively. In addition, there are normal, commercial, technical, and professional schools. There are two universities, which, in 1914, had about 4000 students. Roman Catholicism is the established religion, but the exercise of other forms of worship is tolerated.

**PRODUCTION.** In 1912 1.62 per cent of the area of the country was under cultivation, and of the cultivated area 47.4 per cent was planted to cereals. Wheat production, as reported for 1915, amounted to 5,171,545 metric quintals; oats, 1,031,230; barley, 816,441; beans, 510,668; corn, 462,819; potatoes, 2,580,491. Other products are wine, tobacco, sugar beets, honey, and wool. The latest available figures for live stock relate to 1913, when horses numbered 457,845; mules, 38,193; asses, 32,982; cattle, 1,968,620; sheep, 4,602,317; goats, 299,381; swine, 221,384. In recent years sheep grazing has developed notably in Magallanes Territory, at the far south.

Of Chile's mineral resources, by far the most important is sodium nitrate, produced in the arid north, in the provinces of Antofagasta and Tarapacá, and used in many parts of the civilized world as a fertilizer. The export tax on nitrate provides a large part of the national revenue. The mining of coal is of next importance to that of nitrate, but the output falls considerably short of the domestic demand. Anthracite is mined to some extent, but the high cost of production renders successful competition with similar foreign coal impossible. The production of copper, for which Chile was once famous, greatly declined, but now shows a renewed development. Other minerals exploited to some extent are gold, silver, manganese, cobalt, borate, salt, sulphur, and guano. Large iron deposits await development, and petroleum in presumably pay-

ing quantities has recently been discovered in Magallanes Territory.

**COMMERCE.** The reported value of imports in 1915 was 153,211,557 pesos gold, as compared with 269,756,699 in 1914; exports, 322,209,218 pesos, as compared with 299,676,435. The gold peso is worth 18d. sterling, or approximately 36.5 cents. On this basis, the value of imports and exports has been as follows, in thousands of dollars:

	1911	1912	1913	1914	1915
Imports	127,381	122,076	120,274	98,461	55,922
Exports	123,884	139,878	144,653	109,382	117,606

The great war caused a sharp decline in trade through the suspension of Chile's credit in Europe and the destruction of important markets. In 1914, the larger classified imports were as follows in thousands of dollars: Oils, varnishes, paints, and coal, 18,475; textiles, 17,838; mineral products, 15,973; vegetable products, 14,162; machinery, tools, apparatus, etc., 11,193; arms, ammunition, and explosives, 8639. Classified exports in 1914, in thousands of dollars: Mineral products, 93,208; animal products, 7966; vegetable products, 6082; foreign merchandise exported, 1954; beverages, 64; miscellaneous, 106. The preponderance of nitrate as an export may be seen in the fact that in 1913, when the total export value was 396,310,443 pesos gold, the value of the nitrate export was 305,354,000 pesos gold. Other exports in 1913, in thousands of pesos gold: Copper, 28,804; wool, 9493; hides and leather, 6674; wheat, 6320; borate of lime, 5882; meat, 5385; iodine, 5134; oats, 3467; beans, 1866; nuts, 1485; whale oil, 1312; bran, 1142.

Trade by principal countries, in thousands of dollars:

	Imports		Exports	
	1914	1915	1914	1915
United States	20,149	18,688	31,484	50,190

Total, incl. others	98,461	55,922	109,382	117,606

**COMMUNICATIONS.** The following is taken from a monograph published in 1916 by the Pan American Union: "The total of railways in operation at the end of 1915 was 5888 miles (9476 kilometers). There are other lines now under construction which will bring the railways to a total of 6166 miles (9923 kilometers), including government and private-owned lines. These private lines are principally short railways running from coast ports into the interior, to carry nitrates and other mineral products for shipment abroad. There is, however, among them the trans-Andean, via Juncal, which joins Valparaíso and Santiago (from Llai-Llai) with Mendoza [Argentina], through connection having been inaugurated in 1910; and the International Railway from Antofagasta into Bolivia to Oruro and La Paz [718 miles, or 1155 kilometers]. The great trunk line of the government system is the Longitudinal, called the Central, between Santiago and Valparaíso, 116 miles (187 kilometers), and between Santiago and

Puerto Montt, 751 miles (1208 kilometers), the southern portion of this, from Osorno to Puerto Montt, having been opened to traffic in the early months of 1913. The Longitudinal Railway north of Valparaiso is at present open to Antofagasta and beyond. Another important government railway, built with the coöperation of Bolivia, connects Arica with La Paz [278 miles, or 447 kilometers], thus offering . . . a short line between the highlands and the coast. This road was opened to traffic during 1913. . . . The Chilean government is projecting the electrification of the section uniting Santiago and Valparaiso, the motive power from the river Aconcagua to be used, and as there are numerous rivers flowing westward from the Andes, power can with little difficulty be obtained for the electrification of the entire system south of Santiago. Development for the next few years contemplates the construction of two new trans-Andean railways to connect Chile and Argentina. One of these is planned through the mountains about 300 miles north of Santiago, and the other about 400 miles to the south of the capital. The north line will bring into close touch the nitrate fields of Chile and the agricultural sections of Argentina, to the advantage of both."

During the year 1916 the Chilean government granted a concession to the Potrerillos Railway Co. (Ltd.) for a branch railway from the Chañaral line to the stream of El Barquito, and official approval was given to the transfer from William Braden to the Potrerillos Railway of a concession to construct and operate a branch line from the State Railway near Pueblo Hundido to the mining district of Potrerillos in the Department of Chañaral. Government permission was granted to Emilio A. Carrasco to construct a branch line from the Antofagasta-Bolivia railway, uniting the station Salinas with the nitrate deposits, Los Penitentes and Carabana. The government also granted to Alfredo Aldunate and Felix von J. Marteville permission to construct and exploit an electric railway between La Union, Rio Bueno, and Filuco, and a branch line from Rio Bueno to Lago Rauco.

During the year the construction of the Chilean end of a new trans-Andean railway was seriously discussed by the government which desired its early building. It was to connect the port of Bahia Blanca in Argentina with Lebu and was to cross the Andes in Lonquimay. On the Argentine side the new transcontinental line had been constructed within 20 miles of the Chilean frontier and was halted to wait for similar development on the western slope. The first Trans-Andean road crosses the mountains through the Uspallata Pass, 12,000 feet above sea level and before the great European war a twice a week train service was maintained between Buenos Aires and Valparaiso. This was discontinued until late in the year 1916 when it was resumed as a profitable passenger traffic had been developed as a result of the operation of the Panama Canal.

Telegraphs as reported for the end of 1914: line, 18,181 miles; wire, 32,942 miles; offices, 946. A radiotelegraph system has been installed, with stations at Arica, Antofagasta, Coquimbo, Valparaiso, Talcahuano, Valdivia, Puerto Montt, Juan Fernández Islands, Frutillar (on Lake Llanquihue), and Punta Arenas. Telephone line in 1914, 44,149 miles; wire, 55,589 miles. Post offices, over 1100.

**FINANCE.** The monetary unit is the peso; its par value is 18d. sterling, or approximately 36.5 cents. The paper peso fluctuates in value; in 1915 and 1916 it was worth about 14 cents. For 1916 the estimated revenue was 81,516,000 pesos gold and 115,103,000 pesos paper. The estimated export duties on nitrate amounted to 77,740,000 pesos gold, and estimated import duties to 63,000,000 pesos paper. The revenue for 1914 was reported at 60,581,378 pesos gold and 161,428,664 pesos paper; the expenditure, 65,692,992 gold and 220,321,006 paper. Principal departmental disbursements in 1914: interior, 403,307 pesos gold and 44,326,019 pesos paper; finance, 37,787,359 and 17,223,391; public instruction, 257,788 and 36,974,403; war, 398,388 and 41,770,985; marine, 7,907,755 and 18,452,073; industry and public works, 151,527 and 22,081,396; railways, 4,878,995 and 10,870,036; extraordinary expenditure, 12,491,733 and 13,597,817.

The foreign debt on Dec. 31, 1915, stood at £34,556,380, as compared with £33,277,040 on Dec. 31, 1914. On the latter date, the internal debt amounted to 155,722,335 pesos gold and 34,252,611 pesos paper.

**NAVY.** Besides various small and auxiliary craft, among which are about a dozen destroyers, 5 torpedo boats, and 2 submarines, the navy includes: 2 old battleships, the *Capitán Prat* (1892) and the *O'Higgins* (1897), aggregating 15,600 tons; 1 armored cruiser, the *Esmeralda* (1896), of 7000 tons; 4 protected cruisers (1890 to 1899), aggregating 14,500 tons. Two dreadnoughts building in England for Chile when the great war began were taken over by the British Admiralty.

**GOVERNMENT.** The executive authority is vested in a president, who is elected indirectly for five years and is ineligible for the next term. He is assisted by a council of state and by a cabinet. The council consists of 11 members, 6 chosen by the Congress and 5 by the President. The cabinet ministers are appointed by the President and are responsible to the Congress. The latter body consists of the Senate and the Chamber of Deputies. Senators (37 in number) are elected for six years, and deputies (118) for three years. The President for the term ending Dec. 23, 1920, is Juan Luis Sanfuentes, who succeeded Ramón Barros Luco.

**HISTORY.** At the close of the year 1915 the outcome of the serious ministerial crisis which had occurred in November was still unknown. It had arisen from the demand for a coalition or national ministry and the Opposition had shown itself in strength as early as November 2nd, but nothing was done on account of the disagreement between the two Houses. A few days before the expiration of President Luco's term, a ministry was made up of his supporters, but this gave way about a week later when the new president was installed, and another ministry was formed; but this in turn fell from power on December 31st, the Senate voting against it. On January 12th a new cabinet was formed on coalition principles under Señor Maximiliano Ibañez. In March, according to the official reports, the general conditions in trade and industry had greatly improved, the stringency at the beginning of the war having come to an end. It was said that the loss sustained on account of the cessation of copper and nitrate exportation to Teutonic countries had been made good

by their exportation to other countries. Economy, public and private, had not only averted a financial crisis, but made it unnecessary to draw on the fund held for the conversion of the peso currency.

**CHINA.** The Chinese Republic dates from Feb. 12, 1912, when, by an edict of the Empress Dowager, the infant emperor Pu-yi abdicated the throne and brought the Manchu dynasty to an end. The dynasty dated from 1644. Pu-yi, who was permitted to retain the title of Manchu Emperor, was born Feb. 11, 1906. The capital of the republic is Peking.

**AREA AND POPULATION.** The estimated area of the republic is about 4,278,000 square miles, of which China proper ("the eighteen provinces") comprises 1,532,789 square miles. Besides China proper, the republic includes Manchuria (three provinces), Mongolia (Inner and Outer), Tibet, and Sinkiang (which includes East Turkestan and is now called a province). The degree of authority which the government at Peking exercises in Mongolia and Tibet is variable, and the autonomy of Outer Mongolia is recognized in a Chinese-Russian convention signed in October, 1913. Various estimates or enumerations of the populations dwelling within the limits of the republic have been made under governmental authority, but with so complete an ignorance of statistical method that they command little confidence. There is reason to believe, however, that the traditional 400,000,000 is excessive and that the returns of the so-called census of 1910, which was really an enumeration of households, disclose fairly well the number of inhabitants. The population of China proper seems to be increasing very slowly or perhaps not at all. The number of inhabitants

as calculated from the 1910 enumeration of households is shown below. The figures do not include children under six years of age; these are estimated at 9,000,000. In the case of Szechwan, a figure reported by the viceroy, and regarded as more nearly accurate than the census figure, has been substituted. In addition to area and population, the table gives the provincial capitals.

Much uncertainty exists with respect to urban populations. A calculation based on the 1910 enumeration gave Peking about 821,000 inhabitants; but according to the reported results of a 1912 enumeration, the inhabitants numbered only about 692,500. Estimated population of some of the larger treaty ports: Hankow, 1,321,000; Canton, 900,000; Tientsin, 800,000; Chungking, 702,000; Shanghai, 651,000; Foochow, 624,000; Soochow, 500,000; Ningpo, 455,000; Nanking, 377,000; Changsha, 250,000; Chinkiang, 186,000; Amoy, 114,000; Shasi, 105,000; Wenchow, 100,000. The reported number of foreigners resident in the open ports in 1914 was 164,807, including 84,948 Japanese, 56,319 Russians, 8914 British, 4365 Americans, 3188 Portuguese, 3013 Germans, and 1864 French.

**RELIGION AND EDUCATION.** Ancestor worship is observed by virtually all the people, most of whom acknowledge as their religion either Confucianism, Taoism, or Buddhism. Under the republic no ecclesiastical hierarchy is maintained, but Confucianism is regarded as the basis of ethical teaching in the system of national education. The number of Mohammedans is probably between 5,000,000 and 10,000,000. Roman Catholic natives were reported to number 1,531,216 in 1912; Protestant natives, 356,209 in 1913.

The estimated number of educational institutions of all kinds is about 58,000, with an enrollment of about 1,600,000 pupils and students. In 1905 the government undertook the gradual introduction of Western learning, with the result that the traditional education in the Chinese classics is being widely superseded by more practical instruction. The Imperial University at Peking and the university at Tientsin have European and Japanese in addition to Chinese professors. At Peking is an important medical school.

**INDUSTRIES.** The principal crops, in the north, include wheat, barley, corn, millet, and other cereals, and beans and peas; and in the south, rice, sugar-cane, indigo, cotton. In the south and west, important products are tea and silk cocoons, the latter being produced to some extent in all the provinces. Many kinds of fruit are cultivated. Opium was formerly produced in large quantities, but the output, as well as the importation from India, has been greatly restricted; no Indian opium may be brought into any Chinese province which has succeeded in suppressing poppy cultivation.

China's mineral deposits are rich and extensive, but in general they have been little exploited. The coal deposits, which are worked to some extent, are known to be among the richest in the world. Of the other minerals worked, the more important are tin (in Yunnan), iron (which is abundant in many localities), copper (in Yunnan), antimony (Hunan), lead, zinc, and salt.

The leading manufactures are cotton, silk, and woolen goods. At the end of 1914, 45 mills, with 1,200,000 spindles, were reported in

	Sq. miles	Pop.	Capital
Anhui	54,826	14,077,683	Anking

operation. There is some manufacture of iron and steel, especially at Hanyang, near Hankow. Modern flour and rice mills have been established in various places.

**COMMERCE.** The value of the haikwan tael, in terms of which the Chinese foreign trade is reported, was about 65 cents in 1911, 74 cents in 1912, 73 cents in 1913, and 66.4 cents in 1914. The table below shows general imports and general exports of merchandise and also the special trade (that is, imports for consumption and exports of Chinese produce), values being stated in thousands of haikwan taels:

General trade:	1911	1912	1913	1914
Imports	482,576	485,726	586,290	572,058
Exports	388,410	383,149	419,483	360,280
<b>Special trade:</b>				
Imports	471,504	473,097	570,163	557,109
Exports	377,338	370,520	403,306	345,281

In 1913 and 1914 respectively, the principal imports for consumption were valued as follows, in thousands of haikwan taels: cotton fabrics, 109,882 and 111,168; cotton yarn, 72,537 and 67,091; opium, 41,023 and 37,345; petroleum, 25,403 and 34,433; sugar, 36,464 and 30,372; rice, 18,384 and 21,843; tobacco, 16,891 and 16,299; dyes, etc., 17,511 and 14,180; fish, 12,975 and 13,189; iron, 13,352 and 11,759; flour, 10,301 and 9017; machinery, 7930 and 8494; coal, 9492 and 8449; timber, 6687 and 8154; copper, 6738 and 7527; paper, 7169 and 6471; leather, 7179 and 5972. Principal exports of Chinese produce in 1913 and 1914 respectively, valued in thousands of haikwan taels: raw silk and waste, 83,156 and 63,297; beans and bean cake, 48,458 and 47,078; tea, 33,937 and 36,452; silk manufactures, 21,719 and 16,265; hides and skins, 19,789 and 16,081; cotton, 16,587 and 12,629; oils, 12,609 and 13,184; coal, 6593 and 8711; tin, 10,917 and 8165; wool, 6656 and 7685; wheat, 9514 and 7374; sesame, 12,372 and 6355; live animals, 6731 and 5271; silks, 4435 and 4348; eggs, 4193 in 1914. The large bean export consists chiefly of the soy bean, which is the leading crop of Manchuria. The tea export in 1913 amounted to 192,181,200 lbs.; in 1914, 199,439,700, of which 120,362,133 lbs. to Russia, 22,736,133 lbs. to the United States, 18,772,666 lbs. to the United Kingdom, and 13,597,600 lbs. to Hongkong.

Trade by countries has been as follows, in thousands of haikwan taels:

	Imports		Exports	
	1913	1914	1913	1914
Hongkong	171,686	164,449	117,129	98,400
Japan	119,347	120,687	65,544	63,477
United Kingdom	96,911	104,984	16,846	22,017

Total net	570,163	557,109	403,306	345,281

**SHIPPING.** Vessels entered and cleared at Chinese ports in 1914 numbered 219,649, of 96,326,267 tons, as compared with 190,738, of 93,334,830 tons, in 1913. Of the 1914 shipping, steamers numbered 107,178, of 89,469,882 tons, and sail 112,471, of 6,856,395 tons. Under the Chinese flag were 150,727 vessels, of 24,931,226 tons; British, 32,705, of 38,795,409 tons; Japanese, 22,143, of 23,684,774 tons; German, 3593, of 3,328,597 tons; American, 3116, of 1,017,492 tons; French, 516, of 882,440 tons. In the direct foreign trade, there were entered and cleared in 1913 74,081 vessels, of 29,150,871 tons.

**COMMUNICATIONS.** The roads of China proper are numerous and, though most of them are in poor condition, they carry a large internal trade. Commercially more important than the roads are the many canals and navigable rivers. The reported length of railway in operation at the beginning of 1914 was 5960 miles, including the Manchurian railways; under construction, 2273 miles. One of the most important developments of the national idea in China was the policy of making a system of state railways, and a system of trunk lines which should be constructed and operated by the government was carefully mapped out.

At the end of 1915, there were in all 5184 miles of railway under operation, of which the most important was the system of government railways, which comprised 15 different lines with a total of 3543 miles, thus equaling 68.4 per cent of the total kilometrage in the country. The second class embraced 1490 miles of "concessioned" lines such as the Chinese Eastern, the South-Manchuria, and the Chiaoohou-Tainan Lines; while the last class consisted of 150.4 miles of private lines which were owned and operated by private Chinese companies. This system of government railways up to 1915 cost the Chinese government \$398,221,176, being about \$73,783 per kilometer of line.

There were 627 locomotives of all classes which were brought from more than five different countries. A total of 823 passenger cars and 10,418 goods wagons were used in carrying the 26,036,152 passengers and 14,580,264 tons of freight in 1915. A gross revenue of 56.1 million dollars was earned, while 48 millions were spent for doing the business and paying interest on the capital, leaving \$8,100,000 to the government as a net profit during the same period. In addition to the lines under operation, there were in 1916 about 6200 miles of line either under construction or definitely projected.

The Southern Manchuria Railway, a company operating under a concession, was engaged on construction work on the Ssuningkai-Chengchiatum section of the Ssuningkai-Taonanfu Railway under the terms of a preliminary agreement concluded by China and Japan in 1913. The first section to be constructed was to be 65 miles in length. The whole line was to be 165 miles in length, and feed the Southern Manchuria Railway. A loan agreement was negotiated during the year providing for the construction of the first section at an estimated cost of \$1,500,000.

Another important line on which construction was in active progress in 1916 was the 300-mile stretch on the Canton-Hankau Railway from Hankau to Changsha. On this line track had been laid at both ends, and also at Yochow,

the section under construction representing that part of a larger project which had survived various political and financial difficulties. The Canton-Hankau Railway forms the southern half of the line connecting Canton and Hongkong with Peking, and, by means of the Trans-Siberian Railway, with Europe.

In October, 1916, it was announced that the Siems-Carey Railway and Canal Co., an American corporation, had concluded a contract to build 1100 miles of railway for the Chinese government. This corporation was controlled jointly by the American International Corporation of New York City, and Messrs. Siems & Carey of St. Paul, Minn., the former corporation having already advanced \$500,000 to cover the cost of preliminary surveys and investigations. This corporation was also to finance the construction by the sale of Chinese government bonds, and the contract provided that the railway lines were to be built at cost plus a percentage. The location and construction was to be in charge of an American chief engineer, who was to supervise the operation of the lines when completed, and Americans were also to be employed at the head of the auditing and traffic departments.

As showing the use of railways in China, mention may be made of the Canton-Samshui Railway, a line only 30 miles in length, which carried during 1915, 4,167,673 passengers and 8187 tons of freight. The total receipts of the line were \$302,636. It is considered to be one of the best paying lines in China for its size, as it connects Canton with Fatsshan, a city of some 600,000 population, distant only about 12 miles, and passes through a well populated territory. No new roadbed was constructed during the year, but new station buildings, platforms and turntables were erected and other improvements were made.

The telegraphic system, which is under government control, connects the principal cities with each other and with the neighboring countries. At the end of 1914, there were 36,339 miles of line, 49,963 miles of wire, and 561 offices. Several radiotelegraph stations have been installed. The postal system extends over China proper, Manchuria, and Sinkiang; in 1914, in which year China joined the postal union, the number of post offices was 8324.

**FINANCE.** The estimated ordinary revenue, according to the budget for 1916, was 426,000,000 taels; extraordinary revenue, 40,000,000 taels; total, 472,000,000 taels. The estimated expenditure equaled the estimated revenue, the figure for ordinary expenditure being 286,000,000 taels, and for extraordinary expenditure 186,000,000 taels. Revenue derived from the foreign trade is collected by the Chinese maritime customs, administered by a British inspector-general. Receipts from maritime customs and from opium likin respectively were 37,819,312 and 1,598,218 taels in 1914, as compared with 40,150,720 and 3,819,133 taels in 1913. The haikwan, or maritime customs, tael was valued at about 73 cents in 1913, 66.4 cents in 1914, and 59 cents in 1915. The reported foreign debt at the end of 1914 was about £173,494,000.

**NAVY.** The only serviceable vessels, aside from small craft, are six protected cruisers. Four of them (one, the *Hai Chi*, of 4300 tons), and three of about 3000 tons each were built in

1897 and 1898. The cruisers *Ying Swei* and *Chao Ho*, of 2400 tons each, were completed at Barrow and Elswick respectively in 1912. There are several destroyers, torpedo boats, sea-going gunboats, and river gunboats. The Chinese dockyards are inadequate, no proper naval bases exist, and the small and partly antiquated fleet is lacking in uniformity.

**GOVERNMENT.** The Chinese Republic, established Feb. 12, 1912, upon the abdication of the infant emperor Pu-yi, was recognized by the United States May 2, 1913, and by other powers Oct. 6, 1913. On Feb. 15, 1912, Yuan Shih Kai was declared provisional President; he was elected Oct. 6, 1913, and inaugurated October 10th as the first constitutional President, for the term 1913-18. On May 1, 1914, a new constitution was proclaimed, and on December 29th an edict was promulgated extending the President's term to ten years. At the end of 1915, it was announced that Yuan, upon the advice of the Council of State, had decided to declare himself emperor. An anti-monarchical revolt broke out in Southern China, and in the winter and spring of 1916 several provinces asserted their secession and independence. Yuan continued as President of the republic and in June he died. See below, *History*. The Council of State, numbering 50 to 70 members, appointed by the President, acts as an advisory, administrative, and legislative body pending the election and organization of the future Parliament.

#### HISTORY

**RESTORATION OF THE REPUBLIC.** Toward the end of December, 1915, a revolutionary movement broke out in Yunnan and it soon spread to the four neighboring provinces. At first Yuan Shih Kai (q.v.) declared it could be easily put down, but on January 21st, it was announced that the coronation which had been fixed for a date in February, was indefinitely postponed. The chief cause of the revolt was dissatisfaction with the measures of Yuan Shih Kai, especially his attempt to raise himself to the throne. At the very beginning of the monarchical movement the discontent began to show itself, and after foreign governments had advised Yuan Shih Kai to defer the restoration of the monarchy the rebels gained courage. This movement was thought to have originated in Peking. At first the forces included some 30,000 troops of the regular army, and the leader in the early stages was Tsai Ao. By the middle of January it was reported that while the government had had some success against the revolutionaries early in the month the latter with an army 60,000 strong had defeated Yuan Shih Kai's troops in the Province of Szechwan. By the end of the month the Yunnan rebels were reported to be steadily advancing into this province, and the number of the insurgents at all points to be increasing. Although according to reports the government still had matters under control, the revolution continued to make progress in February, Mongol troops having crossed the Great Wall on February 1st, and Lu-Chow having fallen into the hands of the revolutionists on February 10th. Reports that the government was still sure of holding its own were soon followed on March 21st with the announcement that Yuan Shih Kai had decided to abandon his royal projects and to return to the of-

rice of president, maintaining the republican form of government, and at about the same time Hsu Shi Chang, who in disapproval of the monarchy had resigned from the cabinet, returned to it as secretary of state. Yuan declared that his only reason for consenting to the demands for a monarchy had been the insistence of the public representatives and that he had not taken any measures to restore the monarchy, but he blamed himself for not opposing the movement more forcibly. The laws reestablishing the monarchy were repealed and the republic was reinstated at the meeting of the State Council March 27th. In spite of this concession the activity of the revolutionists continued and by the end of March important points in the Province of Szechwan and elsewhere fell into their hands, while a considerable part of Southern China joined the movement. The revolutionary movement continued to make head during April. On April 6th, Canton, in the Province of Kwang-tung, was declared independent; on April 12th, the Province of Che-King was declared independent and on April 13th, the governor of the Province of Kiang-si declared its independence of the central authority. By May the revolution had divided the country into two divisions, of which only the north was loyal. In South China only one province out of eight remained loyal and it seemed to be loyal in name only. The five provinces of Middle China were disaffected, and according to reports even North China was wavering. Meanwhile on April 22nd the President, admitting that his assumption of power had caused dissatisfaction, authorized the appointment of a responsible cabinet, with Tuan Chi-jui as prime minister and minister of war, and the new ministry was organized on April 24th. The President agreed to turn over to it the civil authority. This concession, however, did not allay the discontent. At a meeting of the National Assembly 216 members voted resolutions condemning the President's action, and rejecting any terms of settlement that retained Yuan Shih Kai as president. All through May the revolutionists continued to make progress and there were occasional collisions between the two parties. A conference called at Nanking on May 27th for the purpose of making a settlement came to nothing and was dissolved. On June 6th, occurred the death of Yuan Shih Kai at his palace at Peking after an illness of a few days. The official announcement gave uræmia as the cause, but rumors were circulated that he had committed suicide or been poisoned. According to reports he had expressed regret just before his death at his part in the monarchical movement. His funeral took place on June 26th.

The Vice-President, Li Yuan-hung, who had been a republican general in command of the revolutionists in 1911, succeeded to the presidency. He proclaimed an amnesty, changed the personnel of the cabinet, and ordered the assembling of Parliament at an early date to reorganize the constitution.

Matters improved somewhat after the end of June, and the country remained during the following month, for the most part, quiet, but there were outbreaks in Canton and Hankow. In the former city the revolutionary general came into conflict with the governor's troops, the residents having been armed to put an end

to his administration. In Hankow the leaders of the radical revolutionary party directed an attack upon the authorities which led to much pillage and the killing of natives for the apparent purpose of intimidating the central government. It was hoped that by so doing Parliament, which was to meet on August 1st, would pay more attention to the demands of the radical element.

**PARLIAMENT.** Parliament met on August 1st, for the installation of the government, and as soon as that was accomplished it adjourned. The President, Li Yuan-hung (q.v.), after taking the oath of office, delivered an address in which non-partisanship was urged. The new cabinet proposed by the Premier Tuan Chi-jui was composed of representatives of all political parties. On September 14th, Parliament confirmed the choice of ministers.

**TROUBLE WITH JAPAN.** Serious difficulties arose with Japan in consequence of an attack, August 15th, by Chinese troops on the Japanese garrison at Cheng-Chiatun, which is situated in a region subject to disputed claims since the signing of the Portsmouth Treaty. The troops killed or wounded 17 Japanese soldiers and one officer. The Japanese immediately sent a force of 2000 soldiers to the aid of the besieged garrison. According to the Chinese account of the affair the local authorities had ordered certain measures of safety to be taken against a threatened raid by bandits and carrying out these measures tried to arrest the Japanese. Armed resistance followed, resulting in the casualties above mentioned. The magistrate responsible for this act was, according to this report, captured and carried off by the Japanese. On September 3rd, the Japanese Minister to China, Baron Hayashi, prepared the following demands: First, dismissal of the Chinese officer in command; second, withdrawal of Chinese troops from the district; third, indemnity to the families of the Japanese slain; fourth, the right of Japan to police power in inner Mongolia. The last of these demands was regarded as very serious as it infringed upon Chinese sovereignty over Inner Mongolia. There were further demands made upon China that were not published. A later version of Japan's requirements indicated that the Japanese demanded also the punishment of the commanding officer, and the dismissal of others, and that Chinese troops should be ordered publicly not to interfere with the Japanese in Inner Mongolia, and South Manchuria; also special interests for Japanese in these territories including police and administrative power, advantages in the matter of loans, etc., were demanded. Upon the inquiry of the United States State Department, the American ambassador to Japan reported on September 12th, that the Japanese Foreign Office declared that there was nothing in the Japanese demands that infringed upon Chinese sovereignty or violated the Root-Takahira agreement. He said that the Japanese demands were limited to apologies, indemnification, and the appointment of Japanese military advisers in South Manchuria, and in the military school at Mukden; also that the Japanese should police localities where there was a large Japanese element.

**RAILWAY CONCESSIONS.** On March 29th, the Chinese government signed an agreement with the Russo-Asiatic bank for the construction of

a railway from Kharbin to Blagoveshchensk, which, covering a distance of 600 miles, will open up river basins and a fertile country. The concession provided for a loan of £5,000,000 to be floated after the war. See also above paragraph on *Communications*.

See *EXPLORATION*.

**CHLORAZENE.** A new antiseptic given as a proprietary name to Dakin's Solution (q.v.) which has been recently used with success in the treatment of infected wounds, where a non-irritating but powerful germicide is necessary. Chlorazene is a white, crystalline powder, having an odor of chlorine, and known chemically as Sodium Para-toluesesulphochloramine,  $\text{CH}_2\text{Cl}_2\text{H}_2\text{SO}_2\text{Na}$ ;  $\text{NCl} + 3\text{H}_2\text{O}$ . Like the hypochlorite, chlorazene does not precipitate proteins, such as blood serum, thus having the advantage over bichlorid of mercury and some other antiseptics in common use. It is said to be absolutely non-toxic, but should not be given internally, since it is precipitated by the gastric juice.

**CHORAL SOCIETIES.** See *MUSIC*.

**CHOSEN.** See *KOREA*.

**CHRISTIAN ENDEAVOR, UNITED SOCIETY OF.** Within the year 2000 new societies of Christian Endeavor have been added to the world organization, making a total of 77,000. There are 4,000,000 members, belonging to 80 denominations. Local conventions meet more often but the international convention is held biennially. The next such gathering, the 28th, will take place in New York City, July 4th-9th, 1917.

**CHRISTIANS.** This denomination according to recent progress had in 1916 about 114,500 communicants, 1400 churches, and 1100 ministers. The administrative body of the Church is the American Christian Convention, which is made up mostly of delegates from the conference. This exercises a general supervision over the work of the denomination. Several schools and colleges are maintained, the most important of which are the Union Christian College in Indiana, Defiance College in Ohio, Starkey Seminary in New York, Elon College and Franklinton Christian College (colored) in North Carolina, Palmer College and Weaubleau College in Missouri, and Jireh College in Wyoming. It has also a theological school, the Christian Biblical Institute, in Ohio. Missions are conducted in Japan, Porto Rico, continental United States, and Canada.

**CHRISTIAN SCIENCE.** The 21st annual business meeting of the Mother Church was held in Boston on June 5, 1916. The report of the clerk gave interesting facts of progress since the dedication of the Mother Church 10 years before. In 1906 there were 949 Christian Science organizations; in 1916 there were 1616, an increase of 70 per cent. During 1906-16 the membership of the Mother Church increased 116 per cent, and the Christian Science periodicals during that period had a much greater percentage of increase than either the branch organizations or the church membership. The net increase in Christian Science organizations in 1915-16 was 65, included among which are churches or societies in South Africa, England, British West Indies, and Panama. There were, in 1916, over 3000 unorganized groups of people throughout the world holding Christian Science services, some being in the most remote and inaccessible parts of distant lands. In 1916 2245 Christian

Science lectures were given, an increase of 716 over 1915. The attendance was about 1,560,000, an increase over that of 1915 of approximately 370,000, or 31 per cent. The total annual attendance at Christian Science lectures more than doubled since 1912. The report of the treasurer showed an excellent financial condition in 1916. Since the opening of the European war relief fund of the Mother Church there had been subscribed all told the sum of \$193,544.36, of which \$187,788.18 had been forwarded to the committees of Christian Scientists entrusted with its distribution. Money was sent to England, France, Germany, Switzerland, Holland, and other European countries.

The total receipts of the Mary Baker Eddy memorial fund up to May 31, 1916, were \$104,791.64, and it was estimated that the total cost of the memorial and the establishment of a fund for its perpetual maintenance will approximate \$150,000. In December, 1916, it was officially stated that the memorial had been nearly completed. The officers of the Mother Church for 1916-17 are: Calvin A. Frye, president; Adam H. Dickey, treasurer; John V. Dittmore, clerk. According to a statement by the trustees under the will of Mary Baker Eddy the trustees paid out, in 1915-16, \$6558.56 for lectures given outside of the United States and Canada. Because of the disturbed conditions of travel in the war zone no lecturer visited central Europe since the last annual meeting. The total amount paid in 1915-16 for Christian Science literature distributed free was \$173,683.35, about one-third of which was contributed by the trustees. A total of 757,643 pieces of literature was distributed in 1915-16 among countries engaged in the European war.

In October, 1916, a statement was issued by the Christian Science Board of Directors announcing that in pursuance of a plan first mentioned by Mrs. Eddy, about 1905, a new and important department of the organized work of Christian Science had been inaugurated under the name of the Christian Science Benevolent Association. Among its objects is that of caring for some of the early students of Mrs. Eddy and for others who helped lay the foundations of the Christian Science movement and who now need provision for their peace and comfort. A gift by Mrs. Longyear of 20 acres of land near Brookline, Mass., was accepted as a site for the first Christian Science home or sanatorium to be established and conducted by the Mother Church. Another statement by the directors in December, 1916, called upon Christian Scientists for a financial contribution of \$526,500 to pay for real estate acquired, and \$600,000 for the buildings, equipment, and maintenance of the first institution of the Christian Science Benevolent Association.

**CHURCH OF THE NEW JERUSALEM.** This denomination in 1916 had about 10,000 com-

municants, 151 churches, and 147 ministers. It rejects the commonly received notion of the Trinity, and acknowledges the Lord Jesus Christ as the One God. The true meaning of the Scriptures was revealed, according to the teaching of this denomination, in the writings of Emmanuel Swedenborg. The General Convention exercises a supervision over the Church. Its officers are: Rev. Julian K. Smyth, president; B. A. Whittemore, recording secretary; J. R. Carter, treasurer. The *New-Church Messenger* is the official journal. The publishing house is at 3 West 29th Street, New York City. It publishes Swedenborg's works.

**CINCINNATI, UNIVERSITY OF.** A coeducational institution at Cincinnati, Ohio, founded in 1870. It is one of the few municipal universities in the United States. There were enrolled in the several departments 3038 students in the fall of 1916. The faculty numbered 159. During the year a new department of physical education was established. Francis Baldwin gave the institution \$600,000. At the end of 1916 the productive funds amounted to \$880,000, yielding an income of \$68,055. By taxation, the city added to this \$219,664. The library has 75,000 volumes. Since a year ago a new chemical building and a woman's building have been completed. President, Charles William Dabney.

**CITY-MANAGER PLAN.** See MUNICIPAL GOVERNMENT.

**CITY PLANNING.** Substantial progress in city planning was made in various directions and in all parts of the country during the year. There was relatively little new State legislation on the subject, it being an "off year" for the legislatures. New York City and Sacramento enacted notable zoning regulations, and the merchants of New York did some very effective zoning work of their own in their "Saving New York" movement. A comprehensive city plan was submitted to the city authorities of Newark, N. J. The civic centres of Cleveland and San Francisco were carried forward by the completion of city halls. Various organizations contributed to the study of city planning and to the creation of sound public opinion on the subject. The good advisory work of the Conservation Commission of Canada was continued. Europe was not able to give much attention to city planning, but will doubtless attack the subject with renewed zeal when the war is over. A Dublin competition, announced before the war, was brought to a conclusion.

**NEW YORK ZONING REGULATIONS.** The use to which buildings may be put, their height in relation to street widths, and their size as regards the percentage of the area of lots that may be covered are all to be governed in New York City by regulations adopted on July 25, 1916, by a 15 to 1 vote of the Board of Estimate and Apportionment—which is the real governing body of New York City. The regulations went into

effect immediately, in all five boroughs of the city, but they apply to new buildings only. They were framed by a Commission on Building Districts and Restrictions, appointed by the Board of Estimate in 1914, in accordance with a legislative act or charter amendment passed in that year. This act, in turn, was recommended by a Heights of Buildings Commission, appointed early in 1913. The earlier commission made a notable report of 295 pages in 1914, covering the whole subject of the height, area, and use of buildings. It recommended that for the purposes of building regulations the city be divided into districts and that regulations for each district be framed in accordance with local conditions. The later commission, composed of 16 members, headed by Edward M. Bassett, chairman, caused a detailed study of the whole city to be made, block by block. Before the regulations were finally adopted by the commission, public hearings were held on the regulations as applied to various geographical sections of the city. There were practically no objections to the general principles on which the regulations are based, a fact that in itself is remarkable testimony to the growth of public sentiment in favor of substituting an orderly plan to the haphazard growth that has hitherto characterized New York and practically all other American cities. Use regulations, under the New York Plan, classify the 327 square miles of the city into residential, business, and unrestricted areas. The classification has been made street by street and block by block, and sectional maps have been prepared showing by symbols just what the use restrictions for each block are. About two-fifths of Manhattan borough and two-thirds of the whole city is made up of residence districts from which business and industry are excluded so far as new establishments are concerned. In the business districts the restrictions are against all manufacturing (except some unobjectionable types), public stables and garages, but not against residences. All the central part of Manhattan, east and west, above 23rd Street, is to be a business district hereafter. Existing factories are not disturbed, but some of these are being moved by the action of the merchants of the district, under the "Saving New York" movement outlined below. On the shores of Jamaica Bay and Staten Island some undetermined areas have been left pending future plans for port development. *Height* of buildings will be governed chiefly by the width of the streets on which they front but there will be variations for different parts of the city. Broadly, the relation between height and width will be 2½ times in the financial district, twice in central Manhattan, 1½ times in the rest of Manhattan and in some small areas, down to heights equal to street widths elsewhere. These figures, however, are materially qualified since a tower occupying not more than a fourth of the area of the lot may be carried to any desired height, while by the use of setbacks the height limitations may also be exceeded for a part of a building. *Size* limits, or the percentage of the lot area that may be covered by the building, vary from 100 per cent in warehouse districts down through three other grades for various uses until in villa residential sections a house may cover only 30 per cent of the lot and must be well separated from other houses on at least one side. Furthermore, the higher the build-

ings, the more of the lot must be left unoccupied. Concessions are allowed where recreational facilities are provided. The report of the commission, made in June, 1916, contains an abundance of diagrams to make clear the various regulations. The administration of the new districting or zoning regulations is in the hands of the city superintendents of buildings for each of the five boroughs and, as regards tenements, in the tenement-house commissioner for the whole city. The city fire commissioner has jurisdiction over completed buildings. Appeals from the ruling of these officials may be made to a Board of Appeals. The Board of Estimate can amend the regulations on its own initiative at any time, after notice and hearings, provided 20 per cent of the property owners to be affected do not object; while if 50 per cent of the property owners on any street or in any district petition for a change in the map as regards their street or district the Board of Estimate must act on the petition within 30 days. Finally, since there is a tendency to follow the lead of New York, it has been urged that regulations framed for the very complex and unusual conditions pertaining in New York City should not be adopted elsewhere to determine whether they suit local conditions.

**SAVING NEW YORK.** A remarkable demonstration of the need for a zoning system in New York was presented just as the commission whose work has been outlined was drawing its labors to a close. It was made by the large retail merchants of New York, who banded together and in full-page advertisements in the daily press of New York not only plead for the exclusion of wholesale clothing manufactories from the district bounded by 33rd and 59th streets on the north and south and Third and Seventh avenues east and west, but also declared that after Feb. 1, 1917, they would give preference to buying from manufacturers located outside the area named. This plea and demand were caused by the recent invasion of the district by clothing manufactories who located close by the large stores, even on Fifth Avenue. The thousands of workers in these shops so crowded the streets at the lunch hour as to make getting in or out of the stores almost impossible. If the stores moved, there was no assurance that they would not be followed by the clothing shops. Indications at the close of the year were that the campaign would be successful and that by this action, combined with the new use and height regulations of 1916, New York will be saved an extension to the northward of the blighted district farther downtown, in which real-estate values have been heavily depreciated by the uncontrolled migration of business and unregulated construction of skyscrapers.

**ZONING AND OTHER CITY PLANNING IN SACRAMENTO.** The zoning system can be applied to a small as well as to a large city, as is shown by the action of Sacramento, Cal., the authorities of which divided the city into three use districts in 1916 and gave attention to various other city-plan reforms as well. Like many other American cities, Sacramento has a surplusage of street area. In the older part of the city more than half of the total area is given up to streets "whereas 30 per cent would be a liberal allowance for a city of the character of Sacramento," says John Nolan in a city-planning report. This 20 per cent (600 acres) of need-

less and ill-planned street area, Mr. Nolan urges, might better have been devoted to a few wide streets where needed for heavy traffic, to plazas, to a liberal civic centre, and to a couple of blocks of land for each public school. Moreover, a reduction in street width would cut down "the cost of street upkeep many thousand dollars a year," while a properly designed street circulating system would "save time in transit for both people and goods and increase the income of the city from local taxes, because more property could be used productively." The evil effects of excessive street widths are not confined to the older part of the city. In newer sections bungalows elbow each other on either side and have their fronts close to the sidewalks because so much land has been taken for streets as to make crowding upon the scanty remaining lot area a seeming necessity.

The zoning system adopted by Sacramento provides for industrial, business, and residential districts. The industrial zone is near the water front and either has or can easily be given railway service. As yet this district has few industries, giving a free hand for adopting street widths and pavements to local needs. The business zone is already devoted to business, but can be improved for that purpose. A part of the residence zone joins the industrial district, thus affording accommodation to those who wish to live close by their daily work. Mr. Nolan has worked out schemes for the arrangement of lots and buildings in first-class, second-class, and bungalow districts, and for neighborhood centres, the latter to include apartments, stores, a school, a church, a theatre, and a fine station grouped around a small park. Last but not least, the Sacramento replanning scheme provides for some new main thoroughfares superimposed on the old gridiron street plan.

**A COMPREHENSIVE PLAN FOR NEWARK.** After three and a half years of study, aided by a permanent secretary and outside specialists, the City Plan Commission of Newark, N. J., submitted a "Comprehensive Plan of Newark" during the year in the form of a report accompanied by numerous maps, diagrams, and halftones. The "Plan" embraces important street improvements to relieve congestion of traffic in the business district and to perfect the chief arteries of travel, as well as extensions and improvements of minor streets and a street plan for the new meadow and port district; transportation changes and additions, including trolley and vehicular service, harbor and railway facilities; new parks and parkways; the better control of housing and of the development of private property, together with districting or zoning; and also "metropolitan planning," or the correlation of the city and its suburbs. Lest so comprehensive a scheme should break down by its own weight, it is carefully distributed by five-year periods over the next forty years. The realization of the "Plan" depends upon action by the city council, to whom the report is addressed. Meanwhile the commission and its studies continue.

**THE SAN FRANCISCO CIVIC CENTRE** is rapidly taking shape. The new city hall, completed during the year, has a ground area of 278 x 415 feet. It is a four-story building, with a central dome 112 feet in diameter and over 300 feet high. The exterior walls and columns are of granite. The building fronts on one of the

larger sides of a plaza 413 x 619 feet in area, that will be decorated with fountains and statuary and planted with trees. A civic auditorium, donated to the city by the Panama-Pacific Exposition, faces one of the shorter sides or ends of the plaza. Across the length of the plaza from the auditorium a State building was under construction in 1916. Facing the city hall across the plaza a public library was being put up, and alongside it, occupying the other corner of the block, a civic opera house is to be erected. A public-health building, a fire-and-police building, and two other public buildings will complete the quadrangular group. Each of these four last-named buildings is diagonally opposite a corner of the plaza and is a small structure compared with the five major buildings in the group, of which five the city hall is of course dominant.

**CLEVELAND.** The third building to be completed in the "Group Plan or Civic Centre" for Cleveland, Ohio, was the city hall, which was dedicated on July 4th. It is a five-story building, covering an area of 230 x 380 feet, with an exterior facing of Vermont gray granite, and much Italian marble for the interior finish. It cost about \$3,000,000. The other two buildings of the group already completed are a Federal building and a county court house. The library in the group plan will be built on the site of the old city hall which is now being wrecked. At the election over a year ago \$2,000,000 bonds were voted to build the building. Considerable time was used up in a friendly suit to settle title, but there should be no further delay. A board having the supervision of construction has been appointed and the architects, Walker and Weeks, have been selected. The group will be completed by the addition of a convention hall, for which bonds were voted in April, 1916, and a union station, already agreed upon by the city and railways, and authorized by popular vote. The six buildings in the group will cost about \$30,000,000 and will follow a general plan worked out a number of years ago by a committee of experts.

**ARTERIAL HIGHWAYS FOR DULUTH.** All over the country civic bodies and commercial organizations having civic committees continue to show their interest in city planning by tackling some local problem—from remodeling the whole city plan to remedying a single outstanding defect. As an example of a middle-ground effort mention may be made of a scheme for arterial highways and for civic centres worked out for the city planning committee of the Commercial Club of Duluth, Minn., by W. B. Patton, formerly city engineer. Duluth suffers from a gridiron or checker-board street plan, ill adapted to a city rising abruptly from the water. The streets running back from the water have heavy grades and as a result considerable areas are unoccupied because access to them is so difficult. The early plan of the city provided for two diagonal thoroughfares, but the one of these that was constructed and used is poorly located and has grades up to 12½ per cent. Several diagonal highways leading up the hill from the water front on relatively easy grades were proposed in Mr. Patton's plan; also a civic centre and a secondary civic centre, each near the lake.

**PROGRESS IN MASSACHUSETTS.** Several years ago, Massachusetts provided for planning boards in all cities and also in all towns of 10,000 pop-

ulation or more, but these boards had little power beyond that of investigation and advice. The 1916 Legislature passed an act (Chap. 190) authorizing the mayor of any city, with the approval of the city legislative body, to appoint a board of survey of three members that would have some real and additional possible control over city planning. The city engineer acts as clerk of any such board. Once such a board is created, no plan or profile of any street can be legally adopted without submission to, hearing upon, and approval by, the board of survey. Possible broader city planning powers are conferred by a section of the new act that says the board of survey of its own initiative may, or when directed by the local planning board and city council must, make a comprehensive plan for any chosen section of the city. Provision is made for hearings on such proposed plans, after which they become official, if so voted by the board of surveys. The city engineer is clerk of the board of surveys and prepares for the board such plans as have just been mentioned.

As an example of the many ways in which city-planning ideas are being spread it may be noted that the Indiana Real Estate Association (Scott R. Brewer, secretary, Indianapolis) conducted a city-planning campaign from October 9th to 16th. Cities having real-estate boards, and other places as well, were visited by officers of the association and addresses on city planning were made by authorities on the subject in accordance with a carefully prepared programme.

**ORGANIZATION WORK.** The National Conference on City Planning held its eighth annual meeting at Cleveland, Ohio, in June. In July the Pennsylvania State Association of City Planning Officials was organized. In November, the Massachusetts Federation of City Planning Boards held its third conference.

**CANADA AND GREAT BRITAIN.** That intelligent city planning rests on an engineering foundation, was emphasized in an article on "Town Planning in Canada," by Thomas Adams, town planning adviser to the Canadian Commission on Conservation, in a recent article (*Engineering News*, May 25, 1916). In Great Britain, nearly all the 152 planning schemes being worked out were in the hands of municipal engineers. The schemes were mostly in their earlier stages and for their full realization will require the coöperation of landscape and building architects. In Canada, Mr. Adams wrote, town planning (the term used in Great Britain and her colonies) "is being placed in the hands of engineers and architects acting in collaboration." With these, public-health experts are also working. "Housing and town planning are dealt with as twin problems." The amenities of life are also given a prominent place. Four of the nine Canadian provinces had planning acts when Mr. Adams wrote. The Conservation Commission serves in an advisory capacity to all the provinces, cities, and towns of the Dominion.

The prize of \$2500 in the Dublin Town Plan Competition, instituted by the Earl of Aberdeen in 1914, while Lord Lieutenant of Ireland, was announced early in 1916 as awarded to Prof. Patrick Abercrombie of Liverpool jointly with Sydney A. Kelley and Arthur J. Kelley. Those securing honorable mention included F. A. C. Smith, Assistant Director Civic Extension Service, Massachusetts Agricultural College. The

judges were Prof. Patrick Geddes, Edinburgh, Charles McCarthy, Dublin, and John Nolan, Cambridge, Mass. An American loan of \$2,000,000 has been obtained by Dublin for city improvements, especially in housing conditions.

**CIVIC ASSOCIATION, AMERICAN.** The 12th annual meeting of the Association, held in Washington the second week of December, marked a year of progress in activities relating to the physical improvement of cities, towns, and rural districts, and to the preservation of natural scenery, such as Niagara Falls and the National Parks. The reports at the convention indicated that in many sections of the country definite work for the planning of cities along orderly lines and for the extension of rural development has been stimulated rather than hindered by European war conditions. An important achievement of the year was the passage by Congress of a bill to create a National Park Service in the Department of the Interior, bringing under one management all national parks and monuments. The proposal for such a service originated with the Civic Association six years ago. Officers: J. Horace McFarland, president; William B. Howland, treasurer; and Richard B. Watrous, secretary. General headquarters are in Washington.

**CIVIC CENTRES.** See CITY PLANNING.

**CIVIC ORCHESTRA.** See MUSIC, *Orchestras*.

**CIVIL SERVICE.** The total number of persons in the civil service of the United States on June 30, 1915, was 476,363. This includes 20,674 employed in the Isthmian Canal service, and are unclassified. The total number in the classified civil service was 455,689. Of these, 34,430 were employed in the departments of Washington, and 421,259 outside Washington. Of those employed in Washington, 8244 were in the Treasury Department, 5021 in the Post Office Department, 4480 in the Department of Agriculture. Of those outside Washington the greater number were fourth class post-masters, 182,167. Of the total number in the civil service, 9730 were appointed by the President. The others held their positions under civil service rules. There were 263,177 competitive positions, 124,039 excepted and uncompetitive positions, and 24,313 unclassified positions.

**LEGISLATURE.** No measures directly affecting the civil service were passed by Congress in 1916, and there was less discussion than usual as to the administration of civil service. Several States passed measures affecting civil service. New York authorized Civil War veterans employed continuously for 10 years in the State service who have reached 70 years of age, to apply for retirement at half pay, not exceeding \$1000. New Jersey required the State commission to provide for the keeping of efficiency rec-

ords for the State and municipal competitive service. Municipalities are required to keep efficiency records subject to the supervision of the State commission. These records are to be used as a basis for promotion, and in the case of reduction of force the persons shown by the records to be the least efficient are to be dropped first. It provides also for demotion to lesser positions of persons whose positions are abolished for reasons of economy, and for placing such persons' names on the special eligible lists, which take precedence of other lists for the positions abolished or similar positions. The New Jersey Legislature also created a commission to study the operations of the civil service laws in the State, and in its municipalities. New York gave municipal commissions the power to investigate the operation of the civil service law and rules, conduct hearings, summon witnesses, etc. The Legislature of Massachusetts authorized the commission to investigate the work and compensation of officers and employees in the classified service, and on request of the appointing power, to inquire into the efficiency and conduct of the particular officers and employees, and if necessary recommend their removal. See CIVIL SERVICE REFORM LEAGUE; UNITED STATES.

**CIVIL SERVICE COMMISSIONS.** See CIVIL SERVICE.

**CIVIL SERVICE REFORM LEAGUE, NATIONAL.** The League held its 36th annual meeting at New Haven, Conn., December 5th. At this meeting the council of the League reported on the work of the year. It was announced that the League would endeavor to have the Tenure of Office acts of 1820 repealed, in order to prepare the way for a reform in the competitive classification of presidential post-masters. It was predicted that a reform would result in saving \$10,000,000 annually. Note was made of the fact that, as never before in the history of the merit system, the two leading presidential candidates in 1916 declared themselves in favor of a programme involving an attack on senatorial spoils. A large share of the League's activity during 1916 related to an attempt to examine the records of the Federal Civil Service Commission. A lengthy correspondence, part of it with the President, was made public on August 9th. It was reported that Postmaster-General Burleson had declared publicly that "60 per cent of the incumbent fourth class postmasters were not disturbed" by the Wilson administration. The League claimed that whatever the situation might be, publicity should not be denied to the records of the Civil Service Commission. The League objected, in 1916, to provisions in the Rural Credits bill, the National Defense legislation, and the Shipping and Immigration bills, on the ground that they violated the merit principle. As passed, only one, the Rural Credits bill, contains the criticised items. The officers of the League are: President, Richard Henry Dana; secretary, George E. Keyes; treasurer, A. S. Frissell.

**CLANRICARDE, HUBERT GEORGE DE BURGHE CANNING, second Marquis.** A British landlord, died April 12, 1916, in London. He was born in 1832, second son of the first marquis. After an education at Harrow, he was stationed in the diplomatic service at Turin for a decade, and from 1867 to 1871 sat in Parliament as Liberal member for County Galway. Three years later

he succeeded his father, his elder brother having died unmarried. He was known in London as an art collector, but throughout Great Britain and abroad was famous chiefly as one of the Irish absentee landlords who opposed the Land Acts most tenaciously and were most cordially hated by their tenants. Lord Clanricarde protested that his rents were not high and could show estates well managed, but he never yielded when it was a question of his legal rights. From the time that he came into possession of his land until the purchase of the Clanricarde estates by the Congested Districts Board in July, 1915, he was engaged, almost without a break, in legal efforts to resist the whole policy of expropriation; the attempt at compulsory purchase he fought up to the highest courts. Finally the Land Court fixed a price for the purchase, £238,211.

**CLARKE, JAMES P.** An American legislator, died in Little Rock, Ark., Oct. 1, 1916. He was born in 1854 at Yazoo City, Miss., and studied law at the University of Virginia, graduating in 1878. Since then he had practiced law in Arkansas, first in Helena, till 1897, and thereafter in Little Rock. He early served in the Lower House of the State Legislature, and then in the State Senate, of which he was elected president in 1891; was Attorney General (1893-94) and Governor (1895-97); and at the end of his first term became a candidate for the United States Senate. Defeated in the primaries by James K. Jones, he began marshaling his forces, gained influence as a member of the Democratic National Committee, and in 1902 fought and won a bitter contest for the nomination that meant election. During his two full terms in the Senate, and the third, on which he had entered, he was known for striking independence of his own party. Recently he had opposed the Ship Purchase bill, bringing success to the Republican filibuster; had proposed the amendment to the Philippines bill, which, if it had been carried by the House, would have given the Philippines independence in four years; and had been one of two Democratic Senators who refused to sign the Eight-Hour Railroad bill of 1916. For several years, Senator Clarke was chairman of the Committee on Commerce, and he was the ranking Democratic member of the Foreign Relations Committee and Committee on Military Affairs.

**CLARKE, JOHN HESSIN.** An American jurist, whose nomination as associate justice of the Supreme Court of the United States, made by President Wilson, was confirmed by the Senate July 24, 1916. Born at Lisbon, Ohio, in 1857, he graduated from Western Reserve University in 1877, the next year was admitted to the bar, and practiced thereafter in various parts of Ohio, after 1897 in Cleveland. In this city he became a supporter of Tom Johnson and of his reform measures, including the three-cent trolley fare. For many years Mr. Clarke was general counsel for the Nickel Plate Railroad. In 1903, as Democratic candidate for the United States Senate, he opposed Mark Hanna. By President Wilson he was appointed in 1914 United States District Judge of the Northern District of Ohio. Judge Clarke identified himself prominently with the anti-imperialist and short ballot movements in Ohio, and in 1913 served as president of the Perry's Victory Centennial Commission of Ohio. He is one of the

few unmarried men ever appointed to the Supreme Court bench.

**CLARK UNIVERSITY.** A non-sectarian institution for graduate study at Worcester, Mass. It was founded in 1889. There were 101 students in the autumn of 1916 and 23 faculty members. The university library and art department have an endowment of \$2,400,000, from which they draw an income of \$103,875. The library contains 65,000 volumes. President, G. Stanley Hall.

**CLASSICAL LITERATURE AND SCHOLARSHIP.** See PHILOLOGY, CLASSICAL.

**CLAY-WORKING INDUSTRIES.** The year 1915 was not one of general prosperity in these industries. The total value of all clay products marketed was \$163,120,232, compared with \$164,986,983 in 1914, a decrease of about 1 per cent. This decrease, however, was only about one-tenth as great as that of 1914, compared with 1913. During the latter part of 1915 business was very much better than in the early months. Of the two great divisions of the industry, brick and tile, and pottery, the former showed a decrease, and the latter showed an increase in value. The decrease in value of brick and tile was \$3,793,978, or nearly 3 per cent. The increase of pottery was \$1,927,227, or more than 5 per cent. In the brick and tile industry an increase was shown in the vitrified front and fire brick, marketed, and a decrease in the quantity of common brick marketed in 1915. In the pottery industry every variety of ware classified, except china, increased in value, and the decrease in china was only about 2 per cent. Every State in the Union is a producer of clay products. Ohio ranks first, followed by Pennsylvania, New Jersey, and Illinois.

**CLEARINGS, BANK.** See FINANCIAL REVIEW.

**CLEARING SYSTEM.** See BANKS AND BANKING, *Federal Reserve System*.

**CLEMENTI-SMITH, SIR CECIL.** A British colonial governor, died Feb. 6, 1916, at Welwyn, Hertfordshire. He was born in London in 1840, and attended Corpus Christi College, Cambridge, which made him an honorary fellow in 1912. He was early a student interpreter at Hong-kong, and later Colonial Treasurer there; subsequently he served as Colonial Secretary of the Straits Settlements, as Lieutenant Governor of Ceylon, as Governor of the Straits Settlements, where he did much to put down the secret Chinese societies, and as High Commissioner and Consul General for Borneo and Sarawak, retiring in 1893. He received the K.C.M.G., later the G.C.M.G., and was made a Privy Councillor in 1906. Clementi-Smith was active in the movement to abolish the opium traffic.

**COAL.** The production and consumption of coal in 1916 exceeded all previous records. The amount of bituminous coal mined during the year is estimated by the United States Geological Survey at slightly more than 509,000,000 net

tons, an increase of more than 66,500,000 tons over the production of 1915. The production of Pennsylvania anthracite was 88,312,000 net tons, or about 600,000 tons less than in 1915. The total production of coal in the United States in 1916 was 597,500,000 net tons, compared with 570,000,000 tons in 1913.

The increase in production was general, only three States, Maryland, Oklahoma, and Texas, having a smaller production than in 1915. The largest increase was in Ohio, whose production in 1916 was estimated at 37,000,000 tons, compared with 22,435,000 tons in 1915, a gain of 65 per cent. Colorado, New Mexico, Virginia, and Washington showed increases of more than 20 per cent, and Kentucky, Montana, North Dakota, Tennessee, and Wyoming of 14 to 18 per cent. In Pennsylvania the increase was about 17,000,000 tons, or 11 per cent.

Consumption of coal by the railroads is estimated to have been 17,500,000 tons greater than in 1915. The use of coal in the manufacture of coke was greater by 20,500,000 tons, approximately increasing 7,000,000 tons. The coal mines used 5,000,000 more tons for steam and heat, and the increased consumption chiefly by manufacturing industry was 21,000,000 tons. Exports were increased by about 2,500,000 net tons. This increased consumption brought about a condition in which the demand for coal was greater than the ability of the railroads to deliver it, and in some localities the mines failed to produce because of the scarcity of labor.

The economic position of coal in 1916, not only in the United States but throughout the world, presented many elements of interest. The excess of demand over supply, the shortage of transportation, and the increase in prices all were related and figured prominently. Most of the bituminous coal in the United States was sold during the year on contract at prices made early in the months that represented merely the increased wages, but these prices during the latter part of the year did not hold for those who had not contracts and were forced to go into the open market. In addition to lack of cars speculation was believed to have figured in the high prices that ensued, but it was argued that the prices of coal were not greater proportionately than those of other necessities whose values had appreciated during the year. At the same time coal was in demand and for export whenever suitable bottoms could be furnished. In many places in the United States the shortage of coal was so pronounced as almost to suggest or threaten a coal famine, and there were instances of coal being purchased and distributed at cost by manufacturers. The congestion of freight on the railroads and at terminals and the inability of mine operators to secure cars also contributed to shortages at various points which forced retailers to pay high prices. These in turn were imposed on their customers, and were a cause of complaint and official investigations.

The shipments of bituminous coal from October, 1915, to March, 1916, were probably greater than in any other like period in the history of the American industry. The maximum monthly total for this period and for both years was reached in January, 1916, and was in excess of 40,000,000 tons. The production in this winter period from October, 1915, to March, 1916, was even higher than the normal output required for

heating and industrial purposes in the winter months as well as on the railways, owing to the fact that large consumers, the railroads in particular, were putting coal into storage in anticipation of a possible shutting down of many of the mines in April and the months following, while a new wage scale was being negotiated. It was estimated that not less than 10,000,000 tons were put into storage. An increase in shipments in August of nearly 14 per cent over July was attributed to the purchase of coal for storage in anticipation of a general railroad strike on September 1st. The demand for coal increased in the last weeks of September and reached a maximum early in November, when prices of free coal were several times those in the earlier part of the year. In October production and shipments were below requirements, and in November and December there were decreases, from October, although even under ordinary conditions increases should have been shown.

The factor most seriously affecting the production and shipment of bituminous coal in the last half of the year was the lack of transportation facilities. Serious trouble from lack of cars was experienced as early as July and was almost universal by the first of October. The production and shipments of bituminous coal in November were about 80 to 85 per cent of the estimated requirements, and the inability of the railroads to transport this additional 5,000,000 to 8,000,000 tons needed by the country caused an actual shortage of fuel at the points of consumption, the result of which was an unprecedented rise in prices for spot coal and a panic among buyers.

So pronounced was the shortage of labor during the year that it was considered an open question whether the mines could have produced all the coal demanded in the last quarter of 1916. Even at the end of 1915 a serious shortage of labor was impending, and in 1916 in many districts this scarcity of labor, notably in the last half of the year, was such as to have restricted production even had the supply of cars been greater. Many workmen sought work in other coal fields in the hope of securing better working time, or going into other industries, such as metal mining in the West and factories and munition works in the East. It was believed that the number of men employed in the production of bituminous coal in 1916 was slightly greater than in 1915 (557,456), and that the average number of days worked was more than 230, compared with 203 in 1915 and 232 in 1913, so that the scarcity of labor was due to a greater increase in the demand rather than in the supply of labor. For labor conditions in Colorado coal fields, see **ARBITRATION AND CONCILIATION, INDUSTRIAL**.

In the Eastern markets a high level of prices for Pennsylvania and Maryland coals in January and February was followed by a recession; but in September there began a buying movement that by the first half of November forced the prices for free coal up to three to five times the summer quotations and more than twice those of the previous January and February. These record-breaking prices prevailed for two or three weeks and were followed by a comparatively slight recession to a level that was maintained to the end of the year. In the Western markets sudden fluctuations in the prices for

free coal in the Chicago market, early in September, were followed in October by a rapid rise that carried prices by the end of November to the high point for the year. The highest point was less than three times the summer level, and the rise was not as great as in the East.

The estimated production of anthracite in 1916 showed a slight decrease compared with the preceding year, but the total quantity sold and delivered to consumers exceeded that of 1915 by more than 10 per cent. The year 1916 opened with an unusual quantity of coal in storage—variously estimated at 8,000,000 to 8,000,000 tons. The first three months of 1916 showed an increase in production over the corresponding period of 1915, but, in April, however, on account of considerable idleness among the miners while the wage agreement was in process of adjustment, there was a decreased output over the same month of 1915. In May, June, July, and August the production was slightly more (about 250,000 tons) than in 1915. During this period in 1916, however, demand for anthracite had been unexpectedly stimulated both by manufacturing industries (owing to a shortage of bituminous coal) and by domestic consumers who, warned by the experience of the winter of 1915-16, had indicated an intention to lay in their fuel for the cold season in advance and at the same time take advantage of the summer discounts. There was a serious shortage of miners and miners' helpers, and other labor in the anthracite region, many operators finding their forces depleted by as much as 25 per cent before the end of the year. Production fell off materially in the last few months of the year, the output for that period being about 2,000,000 tons less than for the corresponding months in 1915.

Coal in Europe in 1916 was a leading consideration in view of the change in economic and industrial conditions brought about by the war. In Great Britain the total amount mined in the first six months of the year was 128,135,000 tons, an increase of 515,000 tons over the corresponding period of 1915, but a decrease of 11,850,000 when compared with the half year of 1914 before the war, notwithstanding every effort was made to secure maximum output. There was more constant working of the pits than ever before and the number of persons employed at the end of the first quarter of the year was but 0.4 per cent less than in 1915, and 14.3 per cent less than in 1914. According to the statements of Mr. Asquith, the nation and the Allies were bound to experience serious results from absenteeism among colliery workers who in many cases were exempt from military service, and it was proposed in some cases to withdraw these exemptions from men refraining from work. In South Yorkshire and Warwickshire new coal developments were in progress and also in South Staffordshire. In November demands for increased wages involving threats of strikes, were made by miners in Scotland and Wales, and as a result in South Wales the government assumed control of all the mines and granted a wage increase of 15 per cent. This of course presented a new situation in Great Britain and its outcome was awaited with interest.

In Germany in 1916 the mining of coal was attended with increased costs and the govern-

ment and the producers were in controversy over the efforts of the latter to raise their quotations. While the government was said to have no strictly legal right to control the price of coal, save for the veto of the Prussian Crown over the Rhenish-Westphalian Coal Syndicate, yet during the war all advances in prices were submitted to the Prussian ministry of commerce. Accordingly at the end of the year increased prices were sanctioned for the Rhenish-Westphalian Coal Syndicate and for the Upper Silesian Coal Convention, to take effect in 1917. These advances made a total since the beginning of the war of five marks for the first named syndicate and four marks for the Upper Silesian Coal Convention. As in other countries cost of production had increased so rapidly that the operators were able to convince the government of the necessity for higher rates. See STRIKES.

**COAL, ARTIFICIAL.** See CHEMISTRY, INDUSTRIAL.

**COAST AND GEODETIC SURVEY, UNITED STATES.** The 100th anniversary of the founding of the United States Coast and Geodetic Survey was celebrated at Washington on April 5 and 6, 1916. There were three public sessions devoted to appropriate historical, technical, and other addresses, a banquet at which addresses were made by President Wilson, the Minister of Switzerland, Secretary of the Navy Daniels, Secretary of Commerce Redfield, and Dr. T. C. Mendenhall, a former Superintendent of the Survey, and a large exhibit of instruments, apparatus, and charts was held in the New National Museum. The Coast Survey was founded in 1816 with F. R. Hassler, a Swiss, as its first Superintendent, and not only organized the surveying of the coasts but also founded the national work in weights and measures. The Superintendent in 1916 was E. Lester Jones. The record of the celebration was published under the title *Centennial Celebration of the United States Coast and Geodetic Survey*, and contains all the addresses, many of which possessed considerable value as monographs on the fields covered.

**COAST DEFENSES.** See MILITARY PROGRESS, *United States*.

**COCHIN-CHINA.** A French colony, the southernmost division of French Indo-China (q.v.). Saigon is the capital, with about 68,000 inhabitants in 1911 (a 1915 estimate is about 100,000); Cholon has about 182,000.

**COINAGE.** See COINS, VALUE OF.

**COINS, VALUE OF.** The table on the following page gives the value of foreign coins in money of the United States.

**COKE.** There were produced in the United States in 1915 41,581,150 net tons of coke, valued at \$105,503,868, an increase, compared with the production in 1914, of 7,025,236 tons, or 20 per cent in quantity, and of \$17,169,651, or 19 per cent in value. By-products of coke showed the largest gain. The total quantity of 14,072,895 tons in 1915, being an increase of 2,852,952 long tons, or 25 per cent, over 1914. The increase in the output was general, except in a part of the South. Of those States whose record can be taken separately, all but six had greater outputs in 1915 than in 1914. The decrease was small, except in Virginia, where the decline amounted to 151,000 tons, or 19 per cent. Other States in which there was a decrease were Alabama, Georgia, and Tennessee in the Southern Ap-

Country	Standard	Monetary Unit	Value in U. S. Gold Dollar	Remarks. (a)

palachian region, and West Virginia and Massachusetts. Pennsylvania contributed nearly 62 per cent of the total output of the United States in 1914. The average value per ton of the coke manufactured was \$2.54.

The coke output of the United States broke all records in 1916. More than 35,000,000 tons of bee-hive coke were manufactured, an increase of over 27 per cent, compared with 1915, and 500,000 tons more than the record-breaking total in 1910. By-product coke amounted to 19,200,000 tons, an increase of more than 5,000,000 tons, or 36 per cent, compared with 1915. The

recent quotations and given as an indication of the value to the legal standard. They are not to take the (b) And silver.

total coke produced in 1916, according to the estimates of the United States Geological Survey, was 54,300,000 tons, an increase of 30 per cent over the production of 1915.

The manufacture of by-product coke is important for its effect on the dyestuff and chemical situation produced by the European war and discussed under CHEMISTRY, INDUSTRIAL. It was estimated that 27,500,000 tons of coal were used in the manufacture of by-product coke in 1916; that 270,000 net tons of ammonium sulphate, 192,000,000 gallons of tar, and 35,600,000 gallons of light oils were recovered; and that

the surplus gas amounted to 118,000,000,000 cubic feet. These estimates are summarized in the following table:

BY-PRODUCTS OBTAINED IN MANUFACTURE OF COKE 1915 AND 1916

	1915	1916	Percent- age of increase
Surplus gas, M cu. ft.	84,355,914	118,000,000	40
Tar, gallons	138,414,601	192,000,000	39
Ammonium sulphate, tons	197,128	270,000	37
Light oil, gallons	16,600,657	85,600,000	110

**COLD STORAGE.** See **FOOD AND NUTRITION; PRICES.**

**COLGATE UNIVERSITY.** A non-sectarian institution for the education of men, founded at Hamilton, N. Y., in 1819. It comprises two departments, college and Baptist Theological Seminary. At the end of 1916 the enrollment of students was 615, while the faculty numbered 50. During the year construction work was begun on a new chapel, a gift to the university. George O. Ferguson, Jr., was appointed associate professor of psychology and education. In the library were 80,000 volumes. President, Elmer Burritt Bryan.

**COLLEGES.** See **UNIVERSITIES AND COLLEGES.**

**COLLEGES, AGRICULTURAL.** See **AGRICULTURAL EDUCATION.**

**COLLISIONS.** See **RAILWAY ACCIDENTS.**

**COLOMBIA.** A northwestern republic of South America, bordering the Pacific Ocean and the Caribbean Sea and bounded by Panama, Venezuela, Brazil, Peru, and Ecuador. The capital is Bogotá.

**AREA AND POPULATION.** Estimates of area differ widely, as most of the Brazilian frontier is undefined, and a large extent of territory claimed by Colombia is also claimed by both Peru and Ecuador. The most satisfactory estimate at present is about 435,000 square miles. The census of March 5, 1912, showed a population of 5,472,604, as compared with 4,533,777 in 1905. These figures include some estimates and also the population of Panama, which appears in the 1912 census with an estimated 400,000. With this figure deducted, the population of Colombia in 1912 becomes 5,072,604. Panama, formerly the northwestern department of the republic, declared its independence Dec. 4, 1903. In a treaty with the United States, signed April 6, 1914, it was agreed that Colombia recognize the independence of Panama and that the United States pay to Colombia \$25,000,000. This treaty was finally ratified by the United States Senate on Feb. 2, 1916. See **UNITED STATES, Treaties.**

The following figures show the population of the larger cities and towns as returned by the 1912 census (the figures relate to *municipios*, which usually comprise rather extended areas): Bogotá, 121,257; Medellín, 71,004; Barranquilla, 48,907; Cartagena, 36,632; Manizales, 34,720; Sonrón, 29,346; Pasto, 27,760; Cali, 27,747; Aguadas, 26,423; Ibagué, 24,693; Palmira, 24,312; Neiva, 21,852; Montería, 21,521; Yarumal, 21,250; Cúcuta, 20,364; Bucaramanga, 19,735; Miraflores (Boyacá), 19,150; Lorica, 19,005; Popayán, 18,724; Cartago, 18,618.

**EDUCATION.** Primary instruction, though free, is not compulsory, and illiteracy is prevalent. The reported number of primary schools in 1915

was 4535, with 305,581 pupils. Secondary schools, most of which are under the management of Roman Catholic orders, numbered 301 in 1915, with 25,382 students. There were also reported 21 professional schools, with 2439 students, and 36 arts and trade schools, with 2924 students. Normal schools in 1914 numbered 28, with 1728 students (649 male, 1079 female). There are mining schools at Medellín and Pasto. Several universities have been established; by far the most important is that situated at Bogotá, a city which has long been a conspicuous seat of Roman Catholic scholasticism. The university has faculties of letters and philosophy, jurisprudence and political science, medicine and natural science, and mathematics and engineering. The state religion is Roman Catholicism.

**PRODUCTION.** Colombia has a vast amount of fertile soil, but only a small proportion has been brought under cultivation. Agricultural progress, as well as that of mining and of industry in general, is handicapped by inadequate means of communication and transportation. The most important crop commercially is coffee. The coastal and hot regions produce sugar cane, corn, cotton, and other fibres, bananas and other tropical fruits, cacao, and rubber, while the mountain and upland districts yield coffee, wheat, barley, potatoes, and other products of the temperate zone. Tobacco and ivory nuts are valuable products. A large proportion of the country is suitable for cattle raising, which in some sections, as along the Sinu River, is a large and profitable industry. Colombia's mineral resources are of exceptional importance, especially in the Department of Antioquia, and include gold, copper, lead, zinc, mercury, iron, coal, salt, platinum, and emeralds. At present the world's supply of emeralds comes almost entirely from Colombia, principally from the Muzo group of mines. In the production of platinum, Colombia ranks second only to Russia. Manufactures, except Panama (Jipijapi) hats, have not attained much importance, though there is some production of textile goods, glass, earthenware, matches, iron castings, sugar, and flour. The Panama hat industry has recently had a remarkable development.

**COMMERCE.** The outbreak of the great war, Aug. 1, 1914, caused a decline in Colombia's foreign trade, as in that of other South American countries. Imports and exports in 1915 were valued at \$18,658,178 and \$29,265,348 respectively, as compared with \$20,979,229 and \$32,632,884 in 1914. Import and export values for five years have been as follows, in thousands of dollars:

	1911	1912	1913	1914	1915
Imports	18,109	23,965	28,536	20,979	18,658
Exports	22,376	32,222	34,315	32,633	29,265

In 1913 and 1914 respectively, leading imports were valued as follows, in thousands of dollars: textiles, 11,455 and 6785; metal manufactures, 3164 and 2670; foodstuffs and condiments, 2817 and 1974; railway cars, carriages, wagons, etc., 1164 and 1028; wines, liquors, and other beverages, 1051 and 748; drugs and medicines, 947 in 1914; materials for the arts and trades, 904 and 461.

Quantity of leading exports in metric tons, in 1913 and 1914: coffee, 61,233 and 61,916; bananas, 143,078 and 130,071; tobacco, 6282 and

2639; cattle hides, 5235 and 4663; ivory nuts, 11,651 and 7121; rubber, 306 and 199. The value of the principal exports is given below, in thousands of dollars:

	1911	1912	1913	1914
Coffee .....	9,475	16,778	18,370	16,098
Gold .....	3,752	4,610	4,100	4,746
Bananas .....	2,172	1,997	3,060	2,988
Cattle hides .....	1,780	2,262	3,181	2,704
Panama hats .....	1,089	1,175	966	1,372
Tobacco .....	333	442	921	392
Ivory nuts .....	789	755	819	827
Rubber .....	901	736	378	175

Trade by countries, in thousands of dollars:

COMMUNICATIONS. Colombia's transportation facilities are very inadequate to the needs of the country. In general the roads are merely mule tracks, but some of the main thoroughfares have been made usable for ordinary vehicles and automobiles. The great river of Colombia, the Magdalena, is impassable at several points on account of rapids and has a bar at its mouth; but nevertheless, together with its tributaries, it affords means for a considerable amount of traffic. There is no continuous railway system, but various short lines facilitate local transportation. A monograph issued by the Pan American Union in 1916 contained a list of these lines to the number of 16; their length varies from 16 kilometers (10 miles) to 174 kilometers (108 miles) and the aggregate length in operation is 1113 kilometers (692 miles). According to another authority, the total length of railway in operation is 708 miles. The Department of Public Works of the Colombian government made a contract during the year for the extension of the Ferrocarril del Noroeste (Northwestern Railroad) from Nemocon to Saboya, a distance of some 75 kilometers (47 miles). The contractors were given an option to continue the construction to San Gil, in the Department of Santander, about 140 kilometers (87 miles) farther. During the year the Colombian Congress authorized government loans for a sum not to exceed \$400,000, to be used in the extension of the Tolima Railway to Ibague. The loan was to be guaranteed by a mortgage on the railway, including the part already constructed. The usual interest rates and the amortization were to be covered by the proceeds of the railway, secured by 2 per cent of the proceeds of the Atlantic custom houses. The Minister of Public Works of Colombia adopted for the proposed railway from Cali to Popayan the route recommended by a committee of the Colombian Society of Engineers. This route, almost wholly in the valley of the Cauca River, was found to be the shortest and most practicable of the routes suggested by the Pacific Railway in a report to the Colombian government in 1915. The completion of the railway to Popayan, the capital of the Department of Cauca and the terminus of an old commercial road running south through Ecuador, would open

an important region to commerce through the port of Buenaventura. Reported length of government telegraph lines, about 12,000 miles, with 524 offices; post offices, 655.

FINANCE. The monetary unit is the peso, equivalent to the American dollar. Silver coins fluctuate in value more or less with the price of silver. The value of the paper peso is fixed by law at one one-hundredth of the monetary unit, but its actual purchasing power is somewhat variable; in 1915 the exchange rate was approximately 105 pesos paper to one peso gold. Estimated revenue and expenditure for 1914, 13,344,769 and 14,771,757 pesos gold respectively; for 1915, 11,942,707 and 15,143,143. The larger items of estimated revenue for 1915 were: customs, 9,716,306 pesos gold; salt tax, 1,055,723; telegraphs, 529,053; stamps, 475,184; consular dues, 447,407. Foreign debt, Jan. 1, 1916, \$3,847,948; internal debt, July 1, 1915, 5,169,770 pesos gold. There is an enormous outstanding paper currency.

GOVERNMENT. The executive authority is vested in a president, elected for four years by direct vote and assisted by a cabinet of eight members. There is no vice-president, but two *designados*, first and second, are elected annually by the Congress to succeed to the presidency in case of the chief executive's death or disability. The legislative power is exercised by a congress of two houses, the Senate and the House of Representatives. Senators (35 in number) are elected by indirect vote for four years; representatives (92) are elected by direct vote. The President in 1916 was José Vicente Concha, who was inaugurated Aug. 7, 1914, in succession to Carlos E. Restrepo.

Colombia having applied to the Swiss government for the services of three Swiss officers during a period of three years in organizing the Colombian army after the Swiss model, a military mission was appointed in Switzerland. It was announced on August 28th that the mission, which would consist of officers of the Swiss army, would soon leave for Colombia, in order to reorganize the military service.

COLORADO. POPULATION. The estimated population of the State in December, 1916, was 975,190. The population in 1910 was 799,024.

The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1915-16 were as follows:

	Acreage	Prod. Bu.	Value
Corn .....	1916 475,000	7,362,000	\$6,626,000
	1915 470,000	11,280,000	6,204,000
Wheat .....	1916 600,000	11,885,000	17,828,000
	1915 560,000	18,310,000	10,648,000
Oats .....	1916 290,000	9,570,000	5,742,000
	1915 300,000	11,700,000	4,797,000
Potatoes ...	1916 50,000	6,900,000	9,315,000
	1915 53,000	7,155,000	3,935,000
Hay .....	1916 970,000	1,988,000	21,868,000
	1915 970,000	2,134,000	16,218,000
Rye .....	1916 28,000	392,000	412,000
	1915 30,000	525,000	368,000
Barley .....	1916 160,000	5,120,000	4,198,000
	1915 130,000	4,680,000	2,246,000

MINERAL PRODUCTION. The production of gold in the State in 1915 was valued at \$22,330,000. There were produced also 7,027,972 fine ounces of silver, 66,664,000 pounds of lead, 7,100,000 pounds of copper, and 100,000,000 pounds of zinc. The total value of these metals was \$43,500,000. The gold produced showed

an increase of \$2,447,000, silver a decrease of 1,716,000 ounces, lead a decrease of 7,550,000 pounds, copper an increase of 603,000 pounds, and zinc an increase of over 200,000 pounds. The net increase in the value of all metals was about \$10,000,000. In the production of gold Colorado ranks second, and is surpassed only by California.

The coal production of the State in 1915 was 8,624,980 short tons, valued at \$13,599,264, an increase of 454,421 tons, or 5½ per cent as compared with 1914. In spite of the increase in the production, the total value remained about the same, due to a smaller price in 1915. There were employed in the coal mines of the State in 1915 12,372 men, compared with 10,098 in 1914. There were no labor disturbances during the year. The State is a considerable producer of petroleum. There were marketed in 1915, 208,475 barrels, which was an increase of about 6 per cent over the corresponding output for 1914.

The output of gold, silver, copper, lead, and zinc in the State in 1916, according to estimates of the United States Geological Survey, amounted to \$18,940,000 in gold, 7,620,000 ounces of silver, 70,200,000 pounds of lead, 8,600,000 pounds of copper, and 130,000,000 pounds of zinc, with a total value of nearly \$49,000,000, compared with a total value of about \$43,500,000 in 1915. There was a decrease in gold, but increases in silver, copper, and zinc. The gold output of Cripple Creek was \$11,800,000, a decrease of \$1,883,000.

See ARBITRATION, INDUSTRIAL.

**TRANSPORTATION.** The total miles of main track of railroad operated in the State on June 30, 1916, was 5646. The total mileage of tracks of all kinds was 7663. The railroads having the longest mileage were the Denver and Rio Grande, 1578; Colorado and Southwestern, 808; the Union Pacific, 591; and the Atchison, Topeka, and Santa Fe, 505.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions of the State include the State Home for Dependent and Neglected Children, Soldiers' and Sailors' Home, Industrial Workshop for the Adult Blind, State Home and Training School for Mental Defectives, State Insane Asylum, the Industrial School for Boys, Industrial School for Girls, the State Penitentiary, and the State Reformatory. The total population of these institutions on Oct. 30, 1915, was 3012. The total expenditure for their maintenance during the year was \$672,884.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments ..	2,034	2,126
Average number of wage earners .....	28,087	27,278
Capital invested .....	\$162,668,000	\$181,776,000
Wages .....	19,912,000	20,200,000
The value of materials used.	80,491,000	89,756,000
The value of products.....	130,044,000	136,889,000

**POLITICS AND GOVERNMENT.** There was no session of the Legislature in 1916, and there were no incidents in the history of the State of

special interest aside from the campaign. Colonel Roosevelt made an address at Denver. (See UNITED STATES, *Presidential Campaign*.) In spite of his efforts, and those of the other Republican speakers, the vote was carried for Wilson by a large plurality, and the entire Democratic State ticket was elected. The Legislature, however, has a Republican majority of one. Mr. Wilson received 178,816 votes, and 102,308 were cast for Mr. Hughes. In 1912 Wilson received 114,232 votes, Taft 58,386, and Roosevelt 72,306.

**STATE OFFICERS.** Governor, Julius C. Gunter, Dem.; Lieutenant-Governor, James A. Pulliam, Dem.; Secretary of State, James R. Noland, Dem.; Treasurer, Robert H. Higgin, Dem.; Auditor, Charles H. Leckenby, Dem.; Adjutant-General, Harry P. Gamble, Rep.; Attorney-General, Leslie E. Hubbard, Dem.; Superintendent of Education, Mary C. C. Bradford, Dem.; Commissioner of Insurance, E. R. Harper, Rep.

**JUDICIARY.** Supreme Court: Chief Justice, S. Harrison White; Justices, S. H. White, W. A. Hill, M. S. Dailey, Tully Scott, James E. Garrigues, James H. Teller, George W. Allen; Clerk, James R. Killian.

STATE LEGISLATURE.

Democrats .....	17	26	43
Republican majority..	1	13	14

**COLORADO, UNIVERSITY OF.** A State co-educational institution at Boulder, Col., founded in 1876. The students enrolled in the fall of 1916 numbered 1334 and the faculty were 200 in number. In June, Charles N. Meader, M.D., was appointed dean of the School of Medicine. The library contains 100,000 volumes. President, Livingston Farrand.

**COLORADO RIVER CONTROL.** See FLOODS.

**COLORED METHODISTS.** See METHODISTS, COLORED.

**COLTON, GEORGE RADCLIFFE.** An American administrator, died in Washington, D. C., April 7, 1916. He was born at Galesburg, Ill., in 1866, and after studying at Knox College in that State, spent five years as a ranchman in New Mexico. Afterward he was a member of the Nebraska House of Representatives (1889-90) and a national bank examiner, and served as lieutenant-colonel in the Philippines, where he organized and supervised, till 1905, the customs service at Manila. After two years in a similar capacity in Santo Domingo, he returned to the Philippines to be insular collector of customs, and he drafted the new tariff for the islands enacted in 1909. From the latter year till 1913, Mr. Colton was Governor of Porto Rico.

**COLUMBIA UNIVERSITY.** A non-sectarian educational institution in New York City, founded in 1754. In 1916 the total number of students in all departments, including extension teaching and the summer session, was 18,176, the net total of students in the winter session being 11,912. The instructors in all departments, including extension teaching, summer session, Barnard College, Teachers College, and the College of Pharmacy, numbered 1042 in 1916. The library contains 661,650 bound

volumes. The productive funds (net investments) amount to approximately \$33,457,400, and during the last college year the total income from all sources was approximately \$5,362,550. The year was marked by a number of important faculty changes. Through resignation or expiration of term of appointment, the following severed their connection with the university: Francis M. Burdick, Dwight professor of law; William H. Burr, professor of civil engineering; Adolphe Cohn, professor of Romance languages and literatures; Camille Fontaine, assistant professor of Romance languages and literatures; George W. Kirchwey, Kent professor of law; Henry S. Redfield, Nash professor of law; William M. Sloane, Seth Low professor of history. By death the university lost: Seth Low, a former president and later a trustee; Edward Van Dyke Robinson, professor of economics; Frank Dempster Sherman, professor of graphics; Anton Vorisek, professor of analytical chemistry; Francis Brown, member of the university council; John McLean Nash, university treasurer. New appointments were: James C. Egbert (director, School of Business); Roswell P. McCrea (economics); Garrard Glenn (law); A. G. H. Spiers (French); Underhill Moore (law); Hastings Lyon (finance); Robert H. Montgomery (accounting); H. Parker Willis (banking); Charles D. Hazen (European history); Frederick A. Goetze (treasurer); Young B. Smith (law). Profs. Gustave Lanson and E. de Martonne were the visiting French professors, and Prof. Federico de Onis was entertained as visiting Spanish professor.

The most important gift of the year was \$600,000 from an anonymous donor for the construction of a building to house the School of Business. Mr. Jacob H. Schiff provided for a new Barnard Students' Building. (See BARNARD COLLEGE.) From the estate of E. C. Bondy \$100,000 was received. For the new School of Dentistry, plans for which are still somewhat tentative, \$125,000 has been received, \$100,000 of this from James N. Jarvie. Students have been registered, for the first two years of the dental course, in the College of Physicians and Surgeons. Women are to be admitted to the Medical School beginning in 1918. See also TEACHERS COLLEGE; UNIVERSITIES AND COLLEGES.

**COMETS.** See ASTRONOMY.

**COMMERCE.** For foreign trade, see UNITED STATES and articles on foreign countries; for internal trade, see UNITED STATES and articles on various industries; see also FINANCIAL REVIEW.

**COMORO ISLANDS.** See MAYOTTE AND THE COMORO ISLANDS.

**COMPENSATION FOR WORKMEN.** See WORKMEN'S COMPENSATION.

**CONCILIATION, INDUSTRIAL.** See ARBITRATION AND CONCILIATION, INDUSTRIAL.

**CONCRETE.** An important publication in-

volving results and conclusions based on some 20,000 tests of mortar and concrete specimens appeared during the year in the United States Bureau of Standards Technologic Paper No. 58, entitled *Strength and Other Properties of Concretes as Affected by Materials and Methods of Preparation*. This paper gave conclusions drawn from about 20,000 tests as to the effect on the properties of concretes and Portland cement mortars of varied conditions and constituents of fabrication. The value of knowing thoroughly the constituents was emphasized, and methods of proportioning and graduation discussed. With the percentage of the cement to the total aggregate fixed, the strength was found to vary as to the density of the mixture.

Varying one factor at a time, extensive experiments were made by the chemists and engineers of the Bureau of Standards to determine with precision the effects of consistency, of age, of density and proportions of the mix, of the nature of the aggregates, of the methods of mixing and placing, and of the manner of curing. It was demonstrated that often greater compressive strength with less cost would result from employing other than the usual standard proportions, such as the 1:2:4 mix so commonly used. Concretes differing widely in composition from Fuller's ideal curve gave high strength, and it was demonstrated that the maximum density curve varied for every aggregate and combination of aggregates. The paper may be secured from the Bureau of Standards at Washington.

**INSTRUCTION FOR CONCRETE WORKERS.** It was announced in the summer of 1916 that with the coöperation of the Portland Cement Association courses of instruction for concrete foremen and contractors would be started by the Wentworth Institute in Boston with the aim of practically training boys and young men for future careers along these lines. The institute set aside one of its best laboratory rooms for the new concrete course, fitting it up with modern testing machinery and other necessary equipment for making various determinations that would illustrate the technical as well as the practical sides of concrete engineering. J. C. Donaldson, Field Engineer of the Extension Division of the Portland Cement Association, was located at the Wentworth Institute, assisting in the necessary preliminaries and afterward in starting and directing the course along the lines planned.

At the various testing and other laboratories much important work was being done on cement and concrete and this material continued to receive much attention as it was being so extensively used.

**A RECORD ERECTION.** The striking availability of reinforced-concrete as building material was shown in what was claimed as a world's construction record, when in 41 days' elapsed time or 25 working days' time, was built the reinforced-concrete frame for an eight-story building 100 x 400 feet. This building, which was constructed for the Baldwin Locomotive Works in Philadelphia, contained 15,000 cubic yards of concrete, exclusive of 5000 cubic yards in footings. The entire building of eight floors and the ground floor slab represented an area of 360,000 square feet, and one single floor was formed and poured in three days. The intense speed was demanded, as the building was to be

used for the manufacture of shells, casings, and other steel products. The work was laid out so that the various materials were delivered to the place needed by motor truck.

**A LARGE CONCRETE ELEVATOR.** An important record in the placing of concrete was made on August 23rd, when 1200 cubic yards were deposited in position in 20 consecutive hours in the construction of the 6,000,000-bushel grain elevator of the Armour Grain Co. on the Calumet River at Chicago. The storage portion of this elevator under construction consisted of 104 circular bins 106 feet high and 22½ feet in diameter. The continuous rising form method of construction was adopted, and for the entire bank of 104 tanks a rise of 1 vertical foot involved placing 168 cubic yards of concrete. The plant involved in this erection was especially designed and electrically operated to secure maximum efficiency.

**CONCRETE FOR PAVING.** The growth of the use of concrete for the paving of roads, streets, and alleys continued and according to the Portland Cement Association there were placed under contract in 1916 nearly 23,000,000 square yards of such construction.

**PATENTS DECLARED INVALID.** A decision in the United States District Court at Trenton, N. J., was recorded in which two Turner "mushroom" floor patents relating to the reinforcement of concrete in the construction of buildings were held invalid. This decision considerably cleared the field in the use of reinforced-concrete in building. There was also other litigation during the year involving different patents for reinforced-concrete, the Luten patent again being held invalid on August 28th in the United States District Court at Columbus, Ohio, Judge Sater concurring in the opinion expressed in the previous year by Judge Lewis in Colorado. The Thacher patent also was held invalid in the United States District Court of Southern Iowa. See BRIDGES; CEMENT; ROADS AND PAVEMENTS.

**CONDENSED MILK.** See MILK.

**CONFERENCES OF CHARITABLE AND SOCIAL ORGANIZATIONS.** See CHARITIES.

**CONFLAGRATIONS.** See FIRE PROTECTION.

**CONGO, BELGIAN.** A Belgian colony in central Africa (the former Congo Free State). The capital is Boma.

**AREA AND POPULATION.** The colony covers an area of 2,365,000 square kilometers (913,127 square miles); white population (Jan. 1, 1912), 5465. No official estimate of native population is given; other sources vary from 9,000,000 to 20,000,000. Besides Boma, important towns are Matadi, Banana, Leopoldville, Stanleyville, Kambove, Niangara, Bandundu, etc. The natives, chiefly of Bantu origin, practice fetichism.

**PRODUCTION AND COMMERCE.** Rubber is the leading article of production and export. The Kilo gold mine has eight experts and 1750 negro workers, and produced in 1910, 867 kilograms of gold. Gold is also found in the Katanga district.

Sale of crown lands in 1910, about 14 hectares, at a total price of 241,528 francs; crown lands rented in 1910, 4062 hectares, rental 18,345 francs. A large proportion of these lands is in the Katanga district.

In 1912 the imports in the special trade were valued at 54,233,000 francs and the exports at 59,926,000; in the general trade, at 62,229,000 and 84,266,000 francs respectively. Principal

exports for comparative years are given below, values in thousands of francs:

	1910	1911	1912	1913
Rubber .....	51,016	34,427	34,519	27,520
White copal .....	8,348	1,814	6,385	8,935
Ivory .....	6,056	5,683	5,552	11,675
Copper .....	.....	1,834	4,112	3,685
Gold .....	2,515	3,119	8,382	6,000
Palm nuts .....	2,657	2,879	2,771	4,844
Palm oil .....	1,798	1,732	1,253	1,842
Cacao .....	1,071	896	1,115	1,036

Imports for consumption include arms and ammunition, 1,148,178 francs in 1912 and 819,201 in 1913; cottons, 1,753,119 and 10,417,756; foodstuffs, 9,582,697 and 8,680,966; machinery, 6,018,653 and 7,916,711; metals, 7,674,857 and 6,580,063; wines and liquors, 3,608,987 and 3,086,811; etc. Countries of origin and destination in the order of their importance are Belgium, Great Britain, Germany, Netherlands, France, etc.

**RAILWAYS.** Railways in operation Jan. 1, 1913, 1390 kilometers. The Cape-to-Cairo Railway was operating through trains from Cape Town to Kambove, North Elizabethville. The next stretch is from Kambove to Bukama, a distance of 204 miles by the recently adopted route, of which 86 miles had been completed at the end of March, 1915, and the roadbed finished some 10 miles more, but work was then proceeding slowly on account of the difficulty of receiving materials. From Bukama there was an all rail and water route to Boma, and when the Kambove-Bukama section was completed direct communication with comparative comfort would be maintained from Cape Town through central Africa to Boma and Banana on the Atlantic coast.

**FINANCE AND GOVERNMENT.** The 1914 budget calculated the revenue at 30,451,276 francs and the expenditure at 63,075,573. The debt stood (1912) at 151,222,200 francs; loan of 1888, 99,780,000 francs; floating debt, 62,545,000 francs. The Governor-General in 1916 was E. J. M. Henrij.

**HISTORY.** In the angle where Belgian, French, and British boundaries meet, close to the frontier of the Sudan, a revolt broke out early in the year under one of the native chiefs. In February he attacked the French post of Mopoi, whose commandant was obliged to fall back to the post of Bangaro in Belgian territory. British forces under Major White occupied the post of Mopoi on the 16th, where they were attacked by the enemy. On March 17th a combined French and Belgian force on their way to Mopoi dispersed the insurgents, and on March 18th the forces combined in operations against the rebels, whom they completely defeated, killing, wounding, and capturing many of them. Among the prisoners was the chief.

**CONGO, FRENCH.** See FRENCH EQUATORIAL AFRICA.

**CONGO FREE STATE.** See Congo, BELGIAN.

**CONGREGATIONALISM.** According to official statements there were in this denomination in the United States in the beginning of 1916, 6103 churches, 5997 ministers, of whom 4001 were pastors and 1996 without charges, 780,414 members, and 766,103 pupils of Sunday schools. There were 3261 Young People's Societies, with 137,827 members; 1681 men's organizations, with 91,557 members. The total contributions to all branches of the work of the

denomination were \$1,895,662. The home expenses of the churches of the denomination were \$10,382,503. The amount of the salaries paid was \$5,265,332, an average of \$1059. The value of church property was \$86,091,528; invested funds amounted to \$10,565,456; debts, \$4,308,534. The national societies include the Congregational Educational Society, the American Board of Commissioners for Foreign Missions, the Congregational Home Missionary Society, the American Missionary Association, the Congregational Church Building Society, the Congregational Board of Ministerial Relief, and the Congregational Sunday School and Publishing Society.

The woman's work of the denomination centres in the Woman's Home Missionary Federation as representing the homeland societies, and in the Woman's Board of Missions, as representing the foreign activities. The report of the Board of Commissioners for Foreign Missions showed that the war had brought added encroachments on its work and heavily increased its burdens, especially in Turkey. There buildings were seized or destroyed; teachers, students, and even entire communities were exterminated. The mission in the Balkans was also disturbed. In Prague, notwithstanding bad conditions, the work was succeeding. Excellent results had also been attained in Japan, China, India, and to some extent in Africa. The board's receipts were \$1,101,570, the largest of any year in its history. The total cost of missions abroad for the year was \$1,163,318. The Home Missionary Society carried on work in 27 States and Territories, and the constituent State societies in 18 more. The number of missionaries was 1774, who cared for 2345 churches and preaching stations. Connected with these churches were 2265 Sunday schools. The receipts of the society and its auxiliaries were \$641,727.12; expenditures, \$648,190.36. During the year 83 new churches were organized, 70 new church buildings erected, and 27 parsonages built. There were 10 theological seminaries with 68 professors and 537 students. The general administration of the Church is under the control of the National Council. The social work is in the hands of the Social Service Commission of the Congregational Church, which is a development from the work of the Department of Labor and Social Service of the Congregational Brotherhood of America. The officers of the National Council for 1915-17 were: Moderator, Hon. H. M. Beardsley; assistant moderators, Rev. W. H. Day and Rev. Alfred Lawless, Jr.; secretary, Rev. H. C. Herring; treasurer, Rev. John J. Walker.

Outside of the United States the number of Congregational churches, chapels, and stations was 12,378, with a membership of 1,141,724, and a Sunday school membership of 1,721,983. Of this total Great Britain and Ireland had 5016 churches, chapels, and stations, 493,378 church members, and 741,046 members of Sunday schools. Canada had 152 churches, chapels, and stations, 12,030 church members, and 9363 Sunday school members. Australia had 470 churches, etc., 21,229 church members, and 36,898 Sunday school pupils.

**CONGREGATIONAL METHODIST CHURCH.** This was a seceding body from the Methodist Episcopal Church, South. In 1852 there arose, because of objection to certain fea-

tures of the episcopacy and itinerary, a company desiring a more democratic form of government. In May of that year a conference was held at Forsyth, Ga., where they adopted the Congregational form of government, but "modified by a certain degree of connectionalism" and chose the name Congregational Methodist Church. In 1916 they had in the United States 196 churches, 220 ministers, and 10,969 members. Their official organ is *The Messenger*, published in Ellenville, Miss., Rev. G. C. Van Devender, editor.

**CONGRESS.** See UNITED STATES.

**CONNECTICUT. POPULATION.** The estimated population of the State in December, 1916, was 1,254,926. The population in 1910 was 1,114,756.

**AGRICULTURE.** The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1915-16 were as follows:

		Acreage	Prod. Bu.	Value
Corn	1916	63,000	2,709,000	\$3,251,000
	1915	65,000	3,250,000	2,762,000
Oats	1916	15,000	450,000	310,000
	1915	18,000	422,000	282,000
Potatoes	1916	22,000	2,090,000	3,658,000
	1915	24,000	2,280,000	3,189,000
Hay	1916	370,000	574,000	10,619,000
	1915	365,000	a 493,000	9,860,000
Tobacco	1916	22,200	36,186,000	9,770,000
	1915	22,000	b 29,970,000	5,995,000
Rye	1916	7,000	137,000	171,000
	1915	7,000	150,000	158,000

a Tons. b Pounds.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned, in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments..	4,251	4,104
Average number of wage earners .....	210,792	226,264
Capital invested .....	\$517,546,000	\$620,194,000
Wages .....	110,119,000	125,220,000
The value of materials used.	257,259,000	288,511,000
The value of products.....	490,272,000	545,472,000

**TRANSPORTATION.** The total railway mileage of the State in 1916 was 999 miles. This includes mileage of all kinds. During the year the New York, New Haven, and Hartford Railroad Company completed a number of sidings and track facilities in several divisions in the State. It also added two tracks between Westbrook and Saybrook Junction. This represents practically all the railway construction during the year. The New York, New Haven, and Hartford has 850 miles of track in the State, the Central New England 83, and the Central Vermont 58.

**EDUCATION.** The total enrollment in the public schools in the State in 1916 was 218,459. The average daily attendance was 175,881. There were 349 regular men teachers and 5986 regular women teachers. The supervising principals numbered 71 men and 502 women. Teachers of special subjects numbered 74 men and 158 women. The average monthly salary of regular men teachers was \$122.70, of regular women teachers \$64.32. The monthly salary of supervising principals averaged \$193.66 and for women \$113.97. For teachers of special

subjects the average was \$90.38 for men and \$61.86 for women.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions include the Soldiers' and Sailors' Home at Noroton Heights, Connecticut Hospital for the Insane at Middletown, Norwich State Hospital for the Insane, Connecticut State Prison at Wethersfield, Connecticut School for Boys at Meriden, Connecticut Industrial School for Girls at Middletown, Connecticut Colony for Epileptics at Mansfield, and Connecticut School for Imbeciles at Lakeville.

**POLITICS AND GOVERNMENT.** The political situation in Connecticut in 1916 was a peculiar one. Governor Holcomb, who had not sought the nomination in 1914, was understood not to want it again, and George P. McLean, whose term as United States Senator expired on March 4, 1917, had said that he was not anxious to return to the Senate. In spite of their individual desires both men were renominated, with the entire Republican State ticket with the single exception of a Secretary of State. The Democrats nominated for Governor, Morris Beardley, of Bridgeport, for many years probate judge in that city, and for United States Senator, Homer S. Cummins, State Attorney of Fairfield County. As the campaign progressed rumors spread that the State had become doubtful. The chief reason for this view which was given out at the New York headquarters of both parties was that a large number of skilled workmen had come into Connecticut to the munition factories, and it was held that a desire to continue the present conditions would lead them to vote the Democratic ticket. In spite of this forecast the Republicans carried the State by a plurality of about 12,000. Mr. Hughes's plurality was 6728. Senator McLean received a plurality of 8371 votes. In one district a Democratic representative to Congress was elected, but in the four other districts four Republican members were elected. Governor Holcomb was reelected by a vote of over 12,000 plurality. The total vote of the State was 213,874 in 1916, compared with 194,581 in 1912. The Socialist vote was 5179, compared with 10,056 in 1912, and the Prohibition vote was 1789, compared with 2068 in 1912. Hartford and New Haven showed greater Democratic gains, and some other parts of the State showed gains by the Republicans.

**STATE OFFICERS.** Governor, Marcus H. Holcomb; Lieutenant-Governor, Clifford B. Wilson; Secretary of State, Frederick L. Perry; Treasurer, Frederick S. Chamberlain; Comptroller, Morris C. Webster; Attorney-General, George E. Hinman; Adjutant-General, Brig-Gen. George M. Cole; Commissioner of Insurance, Burton Mansfield—all Republicans except Mansfield and Bennett, not stated.

**JUDICIARY.** Supreme Court: Chief Justice, Samuel O. Prentice; Associate Justices, George W. Wheeler, John M. Thayer, Alberto T. Roraback, John K. Beach; Clerk, George A. Conant.

STATE LEGISLATURE.

	Senate	House	Joint Ballot
Republicans .....	25	195	220
Democrats .....	10	64	74
Republican majority..	15	131	146

**CONNOLLY, JAMES.** An Irish Nationalist leader, executed May 12, 1916, in Dublin, for

his part in the Sinn Fein revolt of the preceding April. He was born in the Dublin slums and was early a laborer, but he managed to acquire command of several languages and he studied history, economics, and politics, subjects which, taken together with a natural oratorical gift, made him an able speaker. He came to the United States in 1902 and lectured for the Socialist Labor Party, and from 1903 to 1908 was again in this country, lecturing, working as a labor organizer, and editing *The Harp*, a monthly advocating Socialism among the Irish in America. He returned to Ireland with the avowed intention of bringing about a union of the workers of Northern and Southern Ireland. With Larkin and Lehane, Connolly became active as a leader in the industrial union or syndicalist Socialist movement. He edited the chief Dublin labor paper. Connolly and his group became affiliated with the Sinn Feiners, and he it was who was chosen "general in chief of the armies of the Irish Republic" when the 1916 revolt was planned. He was wounded during the fighting, was captured and imprisoned, tried, and sentenced to death.

**CONTAGIOUS DISEASES.** See VITAL STATISTICS.

**CONTRABAND OF WAR.** The conditions as to contraband goods have materially altered since the article which appears in the YEAR BOOK for 1914 was prepared. The first important change was the transfer of cotton (Aug. 22, 1915) from the British free list to absolute contraband. This was to be expected and might properly have taken place sooner, for modern gunpowder is made almost wholly of cotton. The next move of the Entente Allies was to institute a more rigorous investigation of neutral mails on the ground that large quantities of valuable contraband goods were sent through them. Early in 1916 the following statement appeared in the British press:

"The Allied governments announce that whereas both the 'Letter Post' and the 'Parcel Post' have been used by the enemy for the transmission of contraband packages, and whereas Convention XI of the Hague Conference of 1907 relating to the immunity of the mails cannot be held to apply to other than *bona fide* postal correspondence:

"(1) As regards the right of search, and eventually of arrest and seizure, goods dispatched as postal packages cannot and will not be treated otherwise than goods dispatched in any other form;

"(2) The immunity of postal correspondence, as stipulated by the 11th Hague Convention of 1907, in no wise affects the right of the Allied governments to examine, and if necessary to ar-

rest and seize, goods concealed in wrappers, envelopes, or letters contained in mail bags;

"(3) The Allied governments, faithful to their engagements and duly respectful of genuine 'correspondence,' will continue, for the moment, to abstain from seizing on the high seas and confiscating such communications, letters, or dispatches, and will insure their transmission with all possible expedition, as soon as their genuine character has been established."

On April 19, 1916, the British government issued a new contraband list. The prefatory announcement states that for all practical purposes the distinction between the two classes of contraband [absolute and conditional] has ceased to have any value "in view of the fact that the enemy country has taken over control of practically all the articles that appear on the list of conditional contraband."

On July 7th, an Order in Council was published withdrawing all orders theretofore issued under the Declaration of London, and thereby abandoning adherence to that Declaration. The new order declares it to be the intention of Great Britain and her allies to exercise their belligerent rights at sea in strict accordance with the law of nations. On account of the changed conditions of commerce and the diversity of practice, doubts might arise in certain matters as to the rules which the Allies might regard as in conformity with the law of nations, and it is ordered that the following provisions be observed:

*First*—The hostile destination required for the condemnation of contraband articles shall be presumed to exist until the contrary is shown if the goods are consigned to or for an enemy authority or agent of an enemy state, or to or for a person in the territory belonging to or occupied by the enemy, or to or for a person who, during the present hostilities has forwarded contraband goods to an enemy authority or agent of an enemy state, or to or for a person in territory belonging to or occupied by the enemy, or if the goods are consigned 'to order' or if the ship's papers do not show who is the real consignee of the goods.

*Second*—The principle of continuous voyage or ultimate destination shall be applicable both in cases of contraband and blockade.

*Third*—A neutral vessel carrying contraband with papers indicating a neutral destination which, notwithstanding the destination shown on the papers, proceeds to an enemy port, shall be liable to capture and condemnation if she is encountered before the end of her next voyage.

*Fourth*—A vessel carrying contraband shall be liable to capture and condemnation if the contraband, reckoned either by value, weight, volume, or freight, forms more than half of the cargo."

On the same day the French government issued a similar memorandum and promulgated the same rules.

In a long note of 13,000 words, issued in April, the British government defends its orders in regard to regulating commerce to neutral countries contiguous to Germany and offers evidence in proof of the effectiveness of her blockade against Germany. In support of the claim that a large portion of the goods sent to Holland and Scandinavian countries finds its way to Germany, it cites the United States

figures which show that the exports to these countries increased from \$97,000,000 in 1913 to \$235,000,000 in 1915. This presentment, if unopposed by other data, creates a presumption in favor of the British contention; but, if the imports of similar goods from other countries are decreased by approximately equivalent amounts, the presumption is destroyed. The note of April 25th also cites evidence of false consignments to dock laborers, bakers, etc.; and it invites attention to the American doctrine of "continuous voyage." See UNITED STATES AND THE WAR; WAR OF THE NATIONS.

**COOK, ALBERT J.** See HORTICULTURE, *Necrology*.

**COOK, FRANCIS AUGUSTUS.** An American naval officer, died Oct. 8, 1916, at Northampton, Mass. He was born in the same town, in 1843. At 20 he graduated from the United States Naval Academy, then for two years, till the end of the Civil War, served with the western Gulf blockading squadron. For three years (1880-83), with the rank of commander, he had charge of the department of seamanship at Annapolis. As captain, he became commander of the cruiser *Brooklyn* in 1896, and it was in this connection that he became best known, for he was with Commodore Schley's "flying squadron" at the battle of Santiago Bay, and drove the Spanish vessel *Christóbal Colon* ashore. He was commended for "eminent and conspicuous conduct in battle" and was promoted to rear admiral. After the war and until his retirement in 1903, Admiral Cook served on the Naval Examining and Retiring Board. In the Sampson-Schley controversy he maintained officially due loyalty to his chief, but it was known that he considered Admiral Sampson entitled to credit for the victory at Santiago.

**COOK, WALTER.** An American architect, died March 25, 1916, in New York. He was born in the same city in 1846, and practiced his profession there from 1877. In that year he returned from abroad, having studied at the Munich Polytechnic and the Beaux-Arts, Paris. He had earlier (1869) graduated from Harvard. Mr. Cook, as a member of various firms, shared in the designing of various important buildings, including the New York home of Andrew Carnegie, the choir school of the Cathedral of St. John the Divine, also in New York, the stadium and other buildings for the Pan American Exposition, office, library, and other structures. He was a member of the jury for the New York Public Library and of the New York Court House Board; president of the American Institute of Architects (1912-13) and of other organizations; member of the National Academy of Design; and chevalier of the French Legion of Honor.

**COOLIDGE, MRS. ELIZABETH S.** See MUSIC, sections *Orchestras* and *Chamber Music*.

**COÖPERATION.** One of the most notable economic developments of the past few years has been the increase in the United States of co-operative undertakings. The term coöperation thus used does not mean the mutual loyalty of employers and employees in capitalistic industry, but rather combinations of producers or consumers who enter as equals into an organization to lessen competition, eliminate middlemen's profits, and reduce costs of distribution. Beginning with small groups of workmen who club together to purchase their household

supplies, the coöperative idea has extended to many forms of consumers' clubs, producers or selling associations, banking and credit societies (see AGRICULTURAL CREDIT and CREDIT UNIONS), and in fact nearly every form of industrial enterprise.

**UNITED STATES.** In this country the coöperative idea has taken root slowly, but nevertheless within a few years great numbers of coöperative buying clubs have been formed for the purchase of food products direct from farmers and wholesale merchants. It was estimated that in 1916 there were 200 such clubs in New York City alone and several thousand in the large cities east of the Mississippi River. These clubs vary in size from 20 to 300 members; they are frequently organized along racial lines, as Finns, Swedes, Italians, French, etc.; they issue no stock as a rule; do a strictly cash business; and claim to save from 10 to 20 per cent on purchases. In some cases employers of members of such clubs have carried the accounts on the firms' books. Such clubs have frequently had the incidental effect of reducing retail prices in their communities. Moreover, such clubs not infrequently become full developed coöperative stores. Such stores require members to purchase at least a small amount of stock; they sell to members and non-members at the same prices; and divide the profits annually or semi-annually among members in proportion to their purchases. Mr. N. O. Nelson of St. Louis has been instrumental in the formation of coöperative stores in St. Louis, New Orleans, and various small towns. Rural coöperative stores are still common, but on the whole they have not proved so successful as the urban stores. This fact is due largely to lack of business experience causing poor management, small capital, inadequate methods of bookkeeping, and in some instances to disloyalty of members. The latter element may be accounted for by the persistent individuality of the farmer, who, because of environment, is not so well socialized and hence not so much inclined to coöperation as the city dweller.

**Farmers.** Another aspect of coöperative development in this country has been the growth of both buying and selling organizations among the farmers. These purchase supplies at wholesale; own expensive machinery or breeding stock in common; and have even developed into credit unions (q.v.). As selling organizations they have been particularly successful among tobacco growers of Kentucky and Virginia, potato growers of Maine and Maryland, onion producers of Texas, fruit growers of the Pacific coast, wheat farmers of the Middle West and Northwest, and producers of milk, butter, and eggs in numerous sections. Such organizations require honest and efficient management, sincere loyalty and the spirit of coöperation on the part of members, and frequently must maintain their agents in principal selling markets.

**Coöperative Delivery Systems** have been established in numerous cities and large towns well scattered over the whole of the United States. So far they are not to be found to any great extent in large cities, which present a distinct problem in the delivery business. The chief advantages of the system of course are saving of time and labor, increase in promptness and rapidity of delivery, and reduction of the cost from 20 to 50 per cent. Thus at

Everett, Wash., the Merchants' Coöperative Delivery Company has a central station to which goods from coöperating stores are brought and then distributed according to districts at stated hours, 8 and 10 A.M. and 2 and 4 P.M. daily, except at 1.30, 3.30, and 5.30 P.M. on Saturdays. Before the establishment of this system, 41 stores used 45 vehicles for delivery; thereafter the same 41 stores used 15 vehicles, all overlapping of territory being eliminated.

**Coöperative Laundry.** A unique and successful form of coöperation is the coöperative laundry of rural sections, run frequently in connection with the local creamery. That at Chatfield, Minn., as described in the 1915 Year Book of the Department of Agriculture, has the same officers serving it and the creamery corporation. The latter owns the building and rents a part of it to the laundry company. This company is incorporated under the laws of the State with a capital of \$5000, and shares at \$5 each. There were 224 stockholders with only one vote each. The company pays 6 per cent dividends on all stock and then gives to the patrons a rebate of 10 per cent of the amount of business done with the laundry. Farmers do their own delivering, and their laundry bills are deducted from their cream checks each month. Laundry for town or city patrons is also done and is delivered C.O.D.

**EUROPE.** In all European countries coöperative organizations of numerous kinds have long been in operation. On the Continent this is notably true among farmers. In Switzerland, Denmark, Belgium, and Germany every rural activity from buying and selling supplies to education and musical and artistic efforts have been undertaken coöperatively. In Ireland agricultural coöperation under the leadership of Sir Horace Plunkett has accomplished a transformation of rural life during the last 15 years. In France coöperative societies are revitalizing country life; and similar results are being achieved in other parts of Europe, Siberia, and India. While the war has hindered the development of some phases of coöperation on the continent it has on the whole stimulated coöperative undertakings. Many societies in France and Belgium were broken up and their properties destroyed; but membership of coöperative societies in both countries everywhere increased whenever outside the range of actual warfare.

**Great Britain.** In 1915 there were reported in Great Britain 1500 coöperative societies, with 3,000,000 members, or about one-fourth of all the families. In that year these societies distributed several hundred million dollars' worth of goods; returned to their members \$85,000,000; owned \$300,000,000 worth of property; had invested in homes of members a total of \$50,000,000; and employed 150,000 persons. These numerous retail societies have been grouped under wholesale societies in England and Scotland which carry on an extensive printing and book-publishing business, own tea lands in Ceylon and distribute 25,000,000 pounds of tea annually, and produce flour for 15,000,000 consumers, being the largest flour millers in the United Kingdom and the greatest purchasers of Canadian wheat. They own olive groves in Africa, raise currants in Greece and raisins in Spain, manufacture soap, carry on an extensive food manufacturing industry, make watches, manu-

facture 3,000,000 pairs of shoes annually, carry life insurance for more than 1,000,000 of their members, and spend large sums for hospitals and relief for those suffering from strikes, famine, fire, and other disasters. The British wholesale society also does an annual banking business of \$800,000,000. It has taken the lead in the formation of the International Coöperative Alliance which includes similar wholesale societies of at least seven countries and representatives from 10 other countries. As in other countries at war, British coöperative societies maintained lower and more stable prices than other retailers. Consequently their membership greatly increased. While private landlords were increasing rents rapidly, coöperative societies maintained previous rates. Consequently these bodies with their membership scattered throughout the country supplied an irresistible basis for the agitation for government regulation of prices. During 1914 British local coöperative societies showed an increase of 10 per cent in sales, with a total of \$692,360,000; and the English wholesale society reported a 10 per cent increase, with a total of \$175,000,000. For 1915 an increase twice as great was reported.

*Germany.* The great scarcity and extraordinary prices for food products resulted in a great increase in the membership of coöperative retail societies in Germany. These organizations advanced prices less than other retailers. In consequence public employees, who previous to the war were not permitted to belong to such societies, secured privilege of membership. In Hamburg coöperative societies reported early in 1915 a total membership of 78,500, an increase of 10,000, and total sales of \$6,161,000, an increase of 5 per cent. The German wholesale society reported an increase in sales of 20 per cent over those of 1914.

**COPPER.** The copper production in the United States in 1916 surpassed all previous records, according to preliminary estimates made in December by the United States Geological Survey. The average price during the year was \$0.27 a pound, and at this price the output for the year had a value of \$520,000,000 compared with \$242,940,000 for the output of 1915, and \$189,790,000 in 1913. The output of blister and regular copper from domestic ores was 1,928,000,000 pounds in 1916 compared with 1,388,000,000 pounds in 1915, and 1,242,000,000 in 1913. The output of refined copper from primary sources, domestic and foreign, for the year 1916 is estimated at 2,311,000,000 pounds, compared with 1,634,000,000 pounds in 1915, and 1,615,000,000 pounds in 1913. The production of copper from the mines in 1916 was more than double that of 10 years previous, and more than four times that of 20 years previous. The profit resulting from the domestic production was far greater in 1916 than in any previous year. It probably exceeded \$300,000,000.

At the beginning of 1916 there were about 82,400,000 pounds of refined copper in stock in the United States. This quantity added to the refinery production gives the total available supply of about 2,393,000,000 pounds of refined copper. Deducting from this the exports for the first 10 months, and the estimated export for the last two months the supply available for domestic consumption is materially greater than the 1,043,000,000 pounds of 1915, no ac-

count of the stocks being taken at the close of the year. The average price of copper in 1916 showed a marked increase over that of the preceding year, being slightly above \$0.27 a pound, compared with \$0.174 in 1915.

Arizona ranks first among the States in production with a total of about 675,000,000 pounds as compared with 432,000,000 pounds in 1913. Montana with more than 350,000,000 pounds ranks second, and exceeded its previous record production of 314,900,000 pounds in 1912. The production of the State in 1915 was about 268,000,000 pounds. Michigan also made a record production. The output for 1916 was 269,000,000 pounds, compared with about 230,900,000 pounds in 1915. The production of Utah showed an increase of about 60,000,000 pounds over the previous record production of 175,000,000 pounds in 1915. The output from Alaska was estimated at over 120,000,000 pounds, compared with 70,600 pounds in 1915. The production in the State of Nevada was about 100,000,000 pounds. The largest previous production was 85,200,000 pounds in 1913. The production in 1915 was 67,700,000 pounds. New Mexico produced about 90,000,000 pounds, compared with 62,800,000 pounds in 1915. The production of California exceeded 60,000,000 pounds, a large increase over the previous record production of over 53,000,000 pounds in 1909. The production in 1915 was 37,600,000 pounds. Tennessee was the only one of the important copper producing States which failed to show an increase in the output. The production was slightly over 15,000,000, compared with over 18,000,000 pounds in 1915.

**IMPORTS AND EXPORTS.** The imports of all forms of unmanufactured copper for the first 10 months of 1916 amounted to 397,594,000 pounds. This compared with an import of 265,877,000 for the first 10 months of 1915. The imports for the 12 months of 1915 were 315,698,449 pounds. The exports of copper in all forms for the first 10 months of 1916 amounted to 665,472,000 pounds, compared with an export for the first 10 months of 1915 of 529,286,000 pounds. The exports for the 12 months of 1915 were 681,917,000 pounds.

**WORLD'S PRODUCTION.** The greater part of the world's copper is produced by the United States, and consequently belligerent and neutral countries where possible looked to America for their supply. The estimates of world's production compiled by the *Engineering and Mining Journal* for the year 1916 and compared with earlier years are of interest. These statistics were claimed as reasonably accurate for all the countries stated in the table as far down as Russia. From none of the European countries at the end of 1916 were any statistical reports available. Reports from Africa were but partially complete. The Union Minière du Haut Katanga, the largest producer, turned out about 25,000 tons in 1916, against 14,190, in 1915. The production of Russia, Germany, and "other countries" was put at the same figures as in 1915, which in themselves were purely unfounded estimates. These guesses, perhaps permissible in war times, were included in the table in order to arrive at a total, recognizing that even if individually they be enormously in error, the percentage of error in the grand total will be relatively insignificant.

**WORLD'S PRODUCTION OF COPPER (\*)**  
 From *Engineering and Mining Journal*, New York.  
 (In metric tons—2204.6 lbs.)

Country	1913	1914	1915	1916

Merton & Co. ‡ As officially reported. § Privately communicated to *Engineering and Mining Journal* from Japan. \*\* Estimated. †† Communicated by L. Vogelstein & Co.

**BRITISH COPPER TRADE.** As Great Britain was an important consumer of copper for both military and industrial use the government sought to keep down the high prices of the

fixed by the government that it had decided to buy all the necessary copper and zinc and distribute it as seemed best. Naturally the belligerent governments were in the American market for supplies of copper, as for example the Russian government early in September, and a few weeks later was announced the sale of 200,000 long tons for delivery during the first half of 1917 to the French and British governments, a transaction which it may be said would account for about one-third of the total American production in that year.

**COMPARATIVE PRICES.** The importance of copper in the economy of the world under the conditions existing in 1916 best can be appreciated by an examination of the accompanying table of average prices for four years.

See METALLURGY.  
**COPPET, EDWARD J. DE.** See DE COPPET, EDWARD J.

**COPYRIGHT.** Registrations for the fiscal year 1915-16, according to the report of the Register of Copyrights, were 115,967, as compared with 115,193 for the year before. The chief classes were, as before, books, periodicals, musical compositions, prints and pictorial illustrations, and photographs. Renewals numbered 1628 as against 1326 the year before. The applied fees amounted to \$112,986.85. Two amendatory acts were passed by the House of Repre-

**MONTHLY AVERAGE PRICE OF COPPER—1913-16**

New York, cents per pound. London, pounds sterling per long ton of standard copper. \* No quotations.

metal by official interference. In January, 1916, £100 was fixed as the maximum price of electrolytic, although at the time copper was being sold in London for £104. At this time, 60,000 tons were purchased for her munitions makers. In February the ministry of munitions asked purchasers to consult with it before paying £100 for any quantity over 50 tons. On March 1st the government forbade speculation in metals, and the London Exchange at that time was closed four days, after which it reopened under severe restrictions, and it was required that all outstanding contracts for future delivery should be liquidated by May 31st. After this date transactions were only permitted in metals actually on hand and directly with consumers. In December in Great Britain regulations even more drastic were promulgated, requiring all holders of copper to give details of their stocks and metal due under contracts. No transactions or negotiations, except under special license, were to be permitted, and, more important than all, the use of copper was restricted to government work.

**SUPPLIES FOR BELLIGERENTS.** In France on March 1st, manufacturing concerns were noti-

sentatives during the fiscal year. The first—introduced originally by the Chairman of the House Committee on Patents—amended section 28 of the Act of 1909 in such manner as to remove an inconsistency and provide against infringement of copyright "in any work protected under the copyright-laws of the United States," instead of infringement of copyright protected under the Act of 1909 alone, and amended section 30, as follows: The prohibition of the importation of "any piratical copies of any work copyrighted in the United States" was changed to the prohibition of the importation of "any infringing copies, matter or material of any work copyrighted in the United States." The second, introduced on March 30 and referred to the Committee on Patents, proposed to amend section 12 of the Act of 1909 by adding a clause permitting photographs or prints identifying bulky, fragile, or dangerous articles to be submitted accompanied by written or printed descriptions, instead of submitting copies. The fourth Pan-American Copyright Convention, signed at Buenos Aires Aug. 11, 1910, and proclaimed by the United States July 13, 1914, was ratified during the fiscal year by Brazil, Costa Rica, and

Salvador. It had already been ratified by Bolivia, the Dominican Republic, Ecuador, Guatemala, Honduras, Nicaragua, and Panama.

**CORN (MAIZE).** The world's yield of maize in 1916, owing largely to untoward seasonable conditions, was considerably smaller than the yield in the preceding year. The crop of the United States was estimated at over 410,000,000 bushels less than the crop of 1915, and Canada produced only 67 per cent of a normal yield, while the crop in Italy was also reported as poor. The crop harvested in the early months of the year in the southern hemisphere was much smaller than that of the preceding year, and the crop of 1916-17 in Argentina, the principal maize producing country south of the equator, was injured to a marked extent by drouth and locusts. The production in 1916 in the northern hemisphere, according to estimates published by the International Institute of Agriculture, Rome, was 3,364,862,440 bushels, an estimate based to the extent of 85.6 per cent on reports published by countries and of 14.4 per cent on the average production for the five years 1909-13. This production compares with 3,709,939,460 bushels in 1915, representing only 90.7 per cent of it, but is only .6 per cent under the average for the five years 1909-13. In these estimates the following countries which are of considerable importance in corn production, but for which no recent data are available, are not included: Greece, Portugal, Serbia, Turkey in Europe and Asia, Costa Rica, Cuba, Guatemala, Mexico, China, British India, and Morocco. The yield of these countries is roughly estimated at about 433,400,000 bushels, and including this figure, the production of the northern hemisphere amounts to 3,798,262,440 bushels.

The total consumption of the northern hemisphere in 1916-17, excluding the countries just mentioned, is estimated at 3,792,447,000 bushels, and of the southern hemisphere in 1916 at 99,355,160 bushels, making a total world's consumption of 3,891,790,160 bushels, including 40,865,680 bushels required for seed. The world's stock carried over from the preceding crop, estimated at 251,732,820 bushels, added to the 1916 production gives a supply of 3,616,595,260 bushels, or a deficiency, as compared with the requirements for the year, of 275,194,900 bushels.

The average spot price per bushel for the six months April to September, 1916, for Mixed No. 2 at Chicago was 81.7 cents and for American Mixed at Liverpool 142.3 cents, while Yellow Maize at Buenos Aires brought 49.9 cents and Yellow Plate at Liverpool 147.6 cents. Maximum prices were fixed by law in Hungary and Italy and in many countries, both belligerent and neutral, exportation was either absolutely prohibited or greatly restricted. Ocean freight rates were about the same as for wheat, which forms the usual basis of calculation. The average rate from New York to Liverpool for the six months April to September, 1916, was 30.6 cents per bushel and from the River Plate to the United Kingdom, 96.2 cents. These figures compare respectively with about 4 cents and 6 cents per bushel before the outbreak of the European war.

The crop of 1916 in the United States as estimated by the Department of Agriculture, amounted to 2,583,241,000 bushels, produced on 105,954,000 acres, the average yield per acre being 24.4 bushels. As compared with 1915 this was a reduction of 411,552,000 bushels in yield, 243,000 acres in area, and 3.8 bushels in the average per acre. The production was also less than the average for the five years 1910-14. The average farm value on Dec. 1, 1916, was 88.9 cents per bushel, the highest on record, and on this basis the total value of the crop was \$2,295,783,000, which was also unprecedented and greater by \$573,103,000 than the value of the record crop of 1915. The State of Iowa led in production with a yield of 366,825,000 bushels, the average yield per acre being 36.5 bushels. The States ranking next and their yields were as follows: Illinois, 306,800,000; Nebraska, 192,400,000; Indiana, 174,658,000; Missouri, 132,112,000; Texas, 131,100,000; and Ohio, 115,762,000 bushels. In acreage, Illinois ranked first with 10,400,000 acres, followed by Iowa with 10,050,000 acres, these being the only States with 10,000,000 acres or more. The New England States, excepting Rhode Island, continued to report high average yields per acre, the range being from 42 bushels in Massachusetts to 46 bushels in New Hampshire. In Kansas, one of the leading States as a rule, an unfavorable season reduced the average yield to 10 bushels per acre, the lowest for any State.

Since Dec. 1, 1916, when the new Grain Standards act went into effect, only licensed inspectors have authority to inspect and grade shelled corn for interstate and foreign shipment and to issue grade certificates for the same. The standards for shelled corn were changed to take effect Dec. 1, 1916, to the extent that the addition of a test weight for grades No. 1 and No. 2 for all colors of corn is required and that the use of one testing screen with round holes  $\frac{1}{64}$  of an inch in diameter is substituted for the use of the two screens, one  $\frac{1}{64}$  and the other  $\frac{1}{8}$  of an inch in diameter.

**CORNELL UNIVERSITY.** A non-sectarian educational institution at Ithaca, N. Y., founded in 1865. On Nov. 1, 1916, the total number of students, excluding duplicates, was 5264. The total number of different students in 1915-16 was 7143, of whom 5656 were regularly enrolled—4922 men and 734 women. The faculty numbered 684, not including 136 in the Medical College in New York. In February, Morse Hall, the chemistry building, was destroyed by fire, with a loss of \$325,000. Mr. George F. Baker of New York gave \$350,000 to construct three dormitory buildings (grouped in an open quadrangle). The group, known as Baker Court, was completed in 1916. A new Drill Hall costing \$350,000 was to be ready for use in 1917. From anonymous donors \$80,100 was received for a dining hall and Mrs. Dean Sage gave \$50,000 for scientific research. James Morgan Hart, emeritus professor of English literature, and Howard D. Hess, professor of machine design, died in 1916. The following members of the faculty resigned: Frank Irvine, Beverly T. Galloway, Alvin S. Johnson, and George S. Moler. Professor Irving T. Church retired, and Lieutenant Bull, U. S. A., professor of military science and tactics, was ordered to Fort Leavenworth. The following new appoint-

ments were made: Edwin H. Woodruff, dean of law; Oliver Leroy McCaskell, professor in law school; Herbert J. Davenport, economics; Robert M. Ogden, education; Capt. Charles F. Thompson, military science; Dr. Lewis A. Connor, medicine; Dr. Clifford T. Fitch, bacteriology. In June membership in the university faculty was conferred on the adviser of women.

The lecturer for 1916 on the Jacob H. Schiff Foundation for the Promotion of German Culture was Prof. Moritz J. Bonn, of Munich, whose subjects were "International Economics" and "Modern Social Legislation." On the Goldwin Smith Foundation the lecturer was ex-President Taft, who spoke on "International Relations and Duties of the United States" and "The Presidency." Within the last year a radical departure in the government of the university was made by the addition of "professorial trustees." Three members of the faculty were chosen to sit in this capacity. See UNIVERSITIES AND COLLEGES.

Cornell has an endowment of about \$10,000,000 and receives besides annual State appropriations for the Colleges of Agriculture and Veterinary Medicine. The productive funds in 1916 amounted to about \$15,055,000 and the total income to about \$3,225,000. The library contains 474,000 volumes. President, Jacob Gould Schurman.

**CORNWELL, JOHN J.** Elected Democratic Governor of West Virginia, Nov. 7, 1916.

**CORTHELL, ELMER LAWRENCE.** An American civil engineer, died at Albany, N. Y., May 10, 1916. He was born in 1840 at South Abington (now Whitman), Mass. He left Brown University to enlist in the Union army for the Civil War, throughout which he served, rising to be captain of a battery. Afterward he returned to Brown, graduated in 1867, and took up civil engineering in Providence. He was connected with railway surveys and construction in Illinois and Missouri, and with the building of important bridges over the Ohio, Missouri, and Mississippi rivers, being chief engineer of the bridges over the Mississippi at Hannibal and Louisiana, Mo., the latter of which had the longest draw of any constructed to that time, and of the Merchants' Bridge at St. Louis. The bridge which he built over the Ohio at Cairo for the Illinois Central was the longest steel bridge in the world. With James B. Eads, Mr. CortHELL was engaged for four years after 1875 in the construction of the Mississippi jetties; after 1880 he brought the West Shore and Ontario and Western railroads down to a point opposite New York City on the Hudson, and constructed their terminal. Other important works with which he was identified were the harbor works at Tampico, Mexico, the Cape Cod Ship Canal, of which he was chief engineer for 11 years, and the New York State Barge Canal. In 1900-02 he served as consulting engineer in the employ of the Argentine government. Mr. CortHELL wrote vari-

ous books and articles, and, gaining an international reputation, received honors at home and abroad, including office in various engineering societies.

**COSTA RICA.** A Central American republic situated between Nicaragua and Panama and bordering the Caribbean on the east and the Pacific on the west. The capital is San José.

**AREA, POPULATION, ETC.** The estimated area is 48,410 square kilometers (18,691 square miles). The estimated population at the end of 1915 was 427,255 (as compared with 399,424 in 1912), distributed in seven provinces, as follows: Alajuela, 101,105; Cartago, 64,294; Guanacaste, 40,414; Heredia, 45,470; Limón, 23,903; Puntarenas, 21,982; San José, 130,087. The city of San José has about 35,000 inhabitants; Cartago, 8500; Heredia, 8200; Limón, 7000; Puntarenas, 5000; Liberia, 2500. The white population dwells principally in these towns. In 1914, marriages, 2178; births, 18,633; deaths, 9482; immigration, 8955; emigration, 8908.

Elementary instruction is free and nominally compulsory. In 1914 there were 428 elementary schools, with 1381 teachers, 34,624 pupils, and an average attendance of 30,599. There are a few institutions for secondary and for professional education. Religious liberty prevails, but the state religion is Roman Catholicism.

**PRODUCTION AND COMMERCE.** Costa Rica enjoys considerable economic prosperity, due to its agricultural progress and its comparative freedom from political unrest. The leading crops commercially are coffee, bananas, sugar cane, and cacao; other crops, of local importance, are corn, beans, potatoes, and rice. Cattle raising is a profitable industry, especially in the west and in the districts adjoining Nicaragua. In 1915, cattle numbered 337,061; horses, about 60,000. Valuable cabinet woods abound in the forests. Gold, silver, and manganese are mined.

Imports and exports have been valued as follows, in thousands of colones:

	1911	1912	1913	1914	1915
Imports	19,080	21,676	18,678	16,240	9,632
Exports	19,192	21,428	22,197	23,859	21,444

Expressed in thousands of American dollars imports and exports in 1912 were 10,188 and 10,071; in 1913, 8778 and 10,433; in 1914, 7633 and 10,979; in 1915, 4527 and 10,079. Leading imports in 1914 and 1915 respectively, in thousands of colones: Cotton goods, 1721 and 1004; wheat, 788 and 718; flour, 407 and 483; lard, 441 and 310; drugs, 353 and 249; rice, 345 and 234; coal, 538 and 230; electrical material, 375 and 205; railway material, 519 and 134. The principal exports have been valued as follows, in thousands of colones:

	1912	1913	1914	1915
Bananas	7,624	11,171	10,168	9,522
Coffee	10,648	7,753	10,029	8,022
Gold and silver bars	1,625	1,828	1,911	1,738
Cacao	183	226	182	376
Hides and skins	251	286	256	544
Rubber	201	96	26	106
Woods	265	304	266	106

Trade by countries, in thousands of dollars:

	Imports		Exports	
	1914	1915	1914	1915
United States .....	4,065	3,065	4,946	4,917
United Kingdom .....	1,100	555	5,248	4,486
France .....	304	85	125	64
Germany .....	1,077	43	477	18
<b>Total, including others.</b>	<b>7,633</b>	<b>4,527</b>	<b>10,979</b>	<b>10,079</b>

The chief port is Limón, on the Caribbean; second in importance, Puntarenas, on the Pacific.

**COMMUNICATIONS.** The length of railway in operation, as reported by the Pan American Union in 1916, is 693 kilometers (431 miles), including branches and sidings, all of 3-foot 6-inch gauge. Of the total, a length of 134 kilometers (83 miles) is the property of the government, 225 kilometers (140 miles) belong to the Northern Railway Co., and 334 kilometers (208 miles) to the Costa Rica Railway. As the Costa Rica Railway is leased to the Northern, the whole system of 559 kilometers (347 miles) is under one general management. Both of these roads are well constructed and are maintained in good condition. Branch lines have been extended up and down the coast for the service of the banana industry. The main line runs from Limón to San José, a distance of 166 kilometers (103 miles). The Pacific Railway extends from San José to the port of Puntarenas, 111 kilometers (69 miles). Terminal facilities at Limón are excellent; at Puntarenas, the harbor has only 15 feet of water at low tide. Telegraphs, 2467 kilometers (1533 miles), with about 135 offices; 2 radiotelegraph stations, one at Limón and one at Colorado, at the east coast near the Nicaraguan border. Post offices, 208.

**FINANCE.** The standard of value is gold. The monetary unit is the colon; its par value is 46.536 cents. Revenue and expenditure have been as follows, in thousands of colones:

	1911	1912	1913	1914	1915
Revenue .....	9,707	9,951	9,618	8,602	6,384
Expend. ....	9,802	9,311	10,184	9,747	....

The decrease in revenue in 1915 was due to the decrease in imports, as the greater part of the revenue is normally derived from customs. The budget, as voted by the Congress for 1916, showed estimated revenue and expenditure of 7,563,000 and 7,759,200 colones respectively. Principal items of estimated revenue: customs, 3,500,000 colones; liquor taxes, 2,200,000; Pacific Railway, 772,000; posts and telegraphs, 400,000. The 1917 budget, as submitted to the Congress, showed an estimated revenue of 7,485,000 and an estimated expenditure of 8,977,460 colones. Public debt, as reported for Dec. 31, 1915, 41,280,757 colones.

**GOVERNMENT.** The executive authority is vested in a president, elected for four years and ineligible for the next term. He is assisted by a cabinet of six members, appointed by and responsible to him. There is no vice-president, but three *designados*, first, second, and third, are chosen by the Congress to succeed to the executive power in case of the president's death or disability. The legislative power is exercised by the unicameral Constitutional Congress, composed of 43 deputies elected

Y. B. 16-7.

for four years. The President in 1916 was Alfredo González Flores, inaugurated May 8, 1914, in succession to Ricardo Jiménez.

Costa Rica brought an action in March against Nicaragua for the violation of her rights under the canal treaty with the United States and the Central American Court of Justice on May 5th handed down a decision in her favor.

**COST OF LIVING.** See FOOD AND NUTRITION; PRICES.

**COTTON.** The cotton crop of 1916 was slightly larger than that of 1915. In Dec. 11, 1916, the Bureau of Crop Estimates of the United States Department of Agriculture estimated the crop of 1916 at 11,511,000 bales of 500 pounds each, exclusive of linters. This estimate places the crop 2,668,231 bales, or 18 per cent, below the five-year average (1909-14). The acreage planted in 1916 is reported as having been 35,994,000 acres, an increase of 3,887,000 acres over the area planted in 1915, when the yield was 11,191,820 bales. A number of causes have been mentioned as contributing to the reduced yield, among them, a late spring, drought in some parts of the cotton belt and severe storms in others, ravages of the cotton boll weevil, and lack of potash as a fertilizer. The price of cotton on Dec. 1, 1916, was 19.6 cents per pound, and with the prevailing high prices paid for linters and seed, it is quite probable that the total value of the crop of 1916 will exceed that of any previous cotton crop. On account of high prices, the marketing of cotton is proceeding rapidly, the Bureau of the Census reporting 11,045,225 running bales ginned to Jan. 1, 1917. This total includes 188,052 round bales, which are estimated as half bales, and 113,359 bales of Sea Island cotton. The Sea Island cotton production by States was: Florida, 35,664; Georgia, 74,760; and South Carolina, 2935 bales. A preliminary estimate of the crop of the United States made by the International Institute of Agriculture at Rome, on Nov. 20, 1916, reduced to 500-pound bales, was 11,556,000 bales. Members of the New York Cotton Exchange estimate the crop at 11,429,000 bales. Data regarding the 1916 crop in other countries are rather meagre. United States Consular Reports and others estimate the crop of Egypt at 1,089,213 bales, nearly two-thirds of which is the variety Sakellaridis, and of India at about 3,200,000 bales. The Russian crop is estimated at 1,750,000 bales, while that of Turkey is very small by reason of the war. In Brazil, the crop is reported to have suffered from a prolonged drought, and the production is expected to be lower than usual.

The cotton crop of the United States for 1915, the estimated crop for 1915, and the amount ginned to Jan. 1, 1917, exclusive of linters, by States, were:

States	Crop, 1915 500 pound bales	Estimated crop, 1916 500 pound bales	Reported ginned, Jan. 1, 1917 Running bales
United States ...	11,191,820	11,511,000	1,045,225
Alabama .....	1,020,829	525,000	540,820
Arkansas .....	816,002	1,145,000	1,060,708
California .....	25,551	60,000	28,237
Florida .....	47,831	48,000	50,355
Georgia .....	1,908,673	1,845,000	1,811,266
Louisiana .....	341,063	440,000	436,337
Mississippi .....	953,965	800,000	777,213
Missouri .....	47,999	62,000	55,727

States	Crop, 1915	Estimated	Reported
	500 pound bales	500 pound bales	ginned, Jan. 1, 1917 Running bales
North Carolina..	699,494	646,000	642,824
Oklahoma .....	639,626	835,000	798,963
South Carolina..	1,133,919	920,000	922,080
Tennessee .....	303,420	378,000	357,114
Texas .....	3,227,480	3,775,000	3,526,106
Virginia .....	15,809	29,000	26,192
All other States..	7,149	8,000	11,283

Of the States listed as all others, Arizona, New Mexico, Kansas, and Kentucky contributed to the total crop. Arizona is expected to market a crop of 4000 bales of Egyptian cotton besides a small quantity of Durango cotton grown near Yuma. About one-third of the California crop is Durango, a long staple upland cotton of high productivity.

The cotton crop of the United States for 1915, as finally reported by the Bureau of the Census, was 11,191,820 gross bales of 500 pounds each and 930,469 bales of linters. Of the total crop, 101,844 bales were Sea Island cotton produced as follows: Florida, 28,094; Georgia, 57,572, and South Carolina, 6178 bales. In addition to the lint marketed, there was crushed for oil and meal 4,201,059 tons of seed. The value of the entire crop to the producers was \$794,000,000 divided as follows: Lint, \$628,000,000; and seed, \$166,000,000. The exports of cotton from the United States for the year ending July 31, 1916, are reported to have been 6,191,110 bales. The imports for the same period were 437,572 bales, of which Egypt furnished 350,795; Peru, 10,909; China, 35,748; and other countries, 40,120 bales.

The world's production of commercial cotton, exclusive of linters, grown in 1915, was approximately 18,650,000 bales, according to the Bureau of the Census. Shepperson claims that the world's production for 1915 was 20,823,000 bales. The contributions of the leading countries to the mill supply of the world for 1914 and 1915, based upon data from the above sources, were:

Country	1915	1914
	500 pound bales	500 pound bales
Total .....	20,823,000	24,764,000
United States .....	12,122,000	15,438,000
India .....	3,056,000	8,826,000
Egypt .....	920,000	1,384,000
China (including Korea) .....	2,500,000	1,750,000
Russia .....	1,465,000	1,126,000
Brazil .....	275,000	440,000
Mexico .....	60,000	125,000
Peru .....	121,000	103,000
Persia .....	130,000	127,000
Turkey .....	45,000	120,000
All other countries .....	129,000	825,000

The world's consumption of cotton for the year ending July 31, 1916, was approximately 21,011,000 bales of 500 pounds net. Of this amount mills in the United States took 7,279,361 bales, those in the Northern States consuming 2,870,085 bales and those in the Cotton States, 3,527,528 bales. The total number of active and idle spindles in the world is said to be 148,500,000, of which an average of 32,000,000 have been active in the United States during the past year. In addition to the cotton consumed by the mills, the United States required during the year 880,916 bales of linters; France, 525,000 bales; and Italy, 30,000

bales, chiefly for the manufacture of high explosives.

An attempt has been made to take a census of cotton in China, and an area of 4,580,000 acres, with a production of 435,000 bales, is reported. These figures are considered much too low, and based on the known mill consumption and exports, the cotton crop of China is believed to be nearly 2,500,000 bales. The possibilities of India in the production of cotton have been frequently pointed out. The International Committee of Indian Cotton Spinners is reported to be organizing a company, and the government has placed at its disposal for experimental purposes 750,000 acres of land. At least 500,000 acres of land suited to cotton culture has recently been brought under irrigation in the Punjab. A cotton specialist has been employed by the Indian government to conduct experiments in various provinces on cotton breeding, culture, etc. In Egypt the area devoted to cotton has been still further reduced and the pink boll worm ravages have materially lessened the crop. The production of cotton under the auspices of the British Cotton Growing Association has not increased in the past year to any degree, owing to disturbed conditions resulting from the war. The Uganda crop for 1916 is estimated at 40,000 bales. The area planted in Nyassaland was considerably increased, but the crop was expected to fall below the average. The attempt to grow Egyptian cotton in Nyassaland has been abandoned and attention is now given to upland varieties. Efforts to develop a cotton industry in the Gold Coast Colony resulted in a failure and the project has been abandoned. The total amount of British-produced cotton for 1915, India and Egypt excepted, is reported as 78,589 bales. The grant of £10,000 annually made to the British Cotton Growing Association expired March 31, 1916, and it was renewed for £1000 for 1916-17 only. A West Indian Cotton Conference was held at St. Kitts, March 13 to 18, 1916. From reports, it appears that 36,220 bales of 500 pounds each of Sea Island cotton were exported from the West Indies in 1915. In addition, St. Vincent shipped 850 bales of Marie Galante, a perennial cotton produced on that island to some extent. Great injury was done to the cotton crop of the West Indies by the hurricane of Oct. 7 to 10, 1916. A Cotton Growers' Association has been formed by the planters of the British West Indies. A Cotton Congress was held at Rio de Janeiro, Brazil, May 1 to 10, 1916, under the auspices of the National Society of Agriculture, the object of which was to develop the cotton industry in that country. The crop of 1916 in Brazil was below the average, and to June 20, 1916, American cotton in excess of 30,000 bales had been imported to keep the mills employed. There are said to be 250 mills with 1,464,000 spindles in active operation in Brazil. The Minister of Agriculture of Argentina has put in operation a plan for developing cotton culture through the establishment of colonies, the unit for which is about 24,000 acres of land. Free seed, expert advice, and freedom from taxes are assured for a definite period. A cooperative experiment in cotton growing in 1915, with some 300 farmers in Queensland, resulted in failure so far as extending the industry in that country is concerned.

The United States Department of Agriculture and the experiment stations in the Cotton States continue investigations for the improvement of the crop. The Bureau of Crop Estimates reports that the estimate of the 1915 crop was less than one-third of 1 per cent below the actual yield, as shown by the ginning returns to the Bureau of the Census. Spinning tests of Arizona-grown Egyptian cotton have been made which showed that this type, after bleaching, dyeing, and mercerizing, was practically equal to Sea Island, while both the Arizona-grown Egyptian and Sea Island were superior to Sakellaridis. The cooperative experiments carried on by the department and the experiment stations for the production of cotton resistant to wilt, are progressing in a satisfactory manner, and some strains have been obtained that are quite early and very productive.

The cotton boll weevil, which is an important factor in cotton production in the United States, advanced to an extent only equaled by that of 1915. A favorable winter and large infestations early in the season are responsible for the wide spread in 1916, when the northern limits of cotton production in Oklahoma and Arkansas were reached, Georgia and Florida crossed to the ocean, while, according to late information, the South Carolina boundary line was nearly reached. The total area infested in 1916 was 480,940 square miles, a gain of 71,700 square miles over the previous year. The pink boll worm (*Gelechia gossypiella*) was determined by the specialists of the United States Department of Agriculture as being established in the Laguna district of Coahuila, Mexico, the most important cotton-growing district of that country. The knowledge of the presence of this serious pest within 200 miles of the Texas border resulted in amendments to the quarantine regulations regarding the shipment from Mexico of cotton, cotton seed, etc., in order to prevent, if possible, its entrance into this country. The importation of cotton seed and hulls is prohibited, and the lint can only be brought by water transportation through certain specified northern ports.

The Office of Markets of the United States Department of Agriculture is giving attention to problems connected with the handling and marketing of cotton, cotton warehouses, standardization, and the enforcement of the Cotton Futures Act, which was reenacted by Congress at its last session. The work on cotton standards has been continued, and on Jan. 28, 1916, the Secretary of Agriculture promulgated standards for stained and tinged American cotton. Tentative standards for Arizona-Egyptian cotton have been prepared, and studies have been begun on the possibility of the standardization of Sea Island cotton. The official cotton standards for white American cotton have been adopted by nearly all important markets, 633 full sets having been issued to June 30, 1916. Nineteen of the sets were sent to foreign countries. An examination of some of the earlier sets showed the colors bleached to some extent, indicating the necessity of occasional inspection.

**COWS.** See DAIRYING.

**COX, GEORGE BARNESDALE.** An American political leader, died May 20, 1916, in Cincinnati, Ohio. He was born in the same city in 1852, and his name had always been identified with politics there. After various employments in youth, he became part owner in a saloon, and by 1885 he had become leader of a Republican organization, later popularly known as "The Gang," which for more than 20 years was in absolute control in Cincinnati. Cox was called the "Easy Boss" and the "Honest Boss," but while he saw to it that minor graft was not allowed, it was testified in court that his graft collections annually amounted to \$7,000,000. In his own party he had powerful enemies, including Charles P. Taft and William H. Taft, both of whom lived in Cincinnati, and by 1906 the public sentiment against bossism had become so intense that Cox found it desirable to announce his retirement from politics. During his period of control he was uniformly successful, except on the one occasion that he himself ran for office—county clerk—when he was decisively beaten, though the rest of the Republican ticket was successful. As president of the Cincinnati Trust Company, and through his large interest in the Shubert theatrical enterprises, as well as by his political connections, Cox amassed a fortune.

**COX, JAMES M.** Elected Democratic Governor of Ohio, Nov. 7, 1916.

**CREDIT UNIONS.** Beginning with the enactment of the Massachusetts credit union law in 1909 laws of a similar nature have since been enacted in New York, North Carolina, Oregon, Texas, Utah, and Wisconsin. The fundamental purpose of these laws is to make it possible for persons with little individual capital to pool their resources and thus create a group credit where individual credit is practically wanting. (See AGRICULTURAL CREDITS; and LOAN SHARKS.) These laws uniformly require that such unions shall issue stock, and that every member shall be a stockholder. The par value of such stock varies from \$1 to \$5 per share, Utah alone fixing the value by law at \$5. The amount of capital is variable, depending on the membership. The share holders may, as a rule, include persons, firms, corporations, or societies; Utah specifically provides for the admission of cooperative societies and in Massachusetts civic, philanthropic, charitable, and religious organizations, as well as persons, firms, or corporations, have become members. In all of these States credit unions are exempt from taxation, along with savings banks and building and loan associations. The purpose of such exemption is to stimulate thrift. Their dividends are limited in North Carolina to 6 per cent, in Utah to 2 per cent in excess of average interest rates; and in others unlimited. The purpose of dividend limitation is to centre the purposes of such unions not upon profit-making but upon the cultivation of thrift. In Utah and North Carolina credit unions may accept deposits from non-members; in other States only members may make deposits but in view of the small value of shares this is not considered an impediment. The liability of members is limited to their share holdings. In this respect the credit unions differ from the Schultze-Delitzsch unions.

of Germany in which individual liability is unlimited. The powers of such unions include the issuance of shares, the making of loans, and as a rule a considerable variety of other activities. Thus in most States these unions purchase supplies at wholesale; in Massachusetts they purchase bonds and shares of other cooperative organizations; in New York and Oregon they hold shares in and make deposits with other credit unions; and in New York they may purchase securities which are legal investments for savings banks. One of the fundamental principles of all these unions is that the voting is on the basis of membership rather than shares held, that is, one man one vote. During 1915 and 1916 a very large number of such unions were formed among the employees of manufacturing, commercial, and insurance concerns. See COÖPERATION.

**CRETE (CANDIA).** An island in the Mediterranean Sea. Area, 3327 square miles; population (census of April 17, 1911), 344,001. Canea, the capital, has 25,185 inhabitants. The island formed part of the early and later Roman empires, and in 1669 was captured by the Turks; they retained it till 1898, when a semi-independent government was established under a high commissioner by Great Britain, Russia, France, and Italy, subject to the suzerainty of the Sultan of Turkey. At the outbreak of war between Greece and Turkey in October, 1912, Crete was declared a part of the Hellenic kingdom, and the treaty of Bucharest (Aug. 10, 1913) confirmed its status. See GREECE.

**CRICKET.** The European war prevented any cricket matches of importance from being held in Great Britain, the home of the game. The annual matches between Oxford and Cambridge universities and Eton and Harrow were among those called off. The Metropolitan League title went to the Brooklyn Club with 10 victories, 3 defeats, and 2 drawn games. Manhattan, the winner in 1915, finished second with 10 victories, 4 defeats, and 1 drawn game.

The New York and New Jersey Association honors were captured by the Staten Island Club, Bensonhurst being second and the Bensonhurst Rovers third. B. Kortlang of the Richmond County Club won the batting laurels while the bowling trophy was taken by M. R. Cobb of the Staten Island Club.

The Germantown Club of Philadelphia for the second year in succession, captured the Halifax cup, winning 5 games, losing 1, and drawing 1. The New York cricketers were second with 4 victories, 2 defeats, and 2 draws.

**CROPS.** See article AGRICULTURE, and section *Agriculture* under various countries and States of the United States.

**CROSS, CHARLES F.** See CHEMISTRY, *INDUSTRIAL, Medals*.

**CROSS COUNTRY RUNNING AND MARATHONS.** Villar Kyronen of the Millrose A. A. was crowned king of cross country runners in 1916. He won the championship title from a large field in the race held over the Van Cortlandt Park course, New York City. Kyronen's time was 32 minutes, 46 seconds. Hannes Kolehmainen, unattached, the 1915 champion, finished second, and John W. Overton, of Yale University, third. The junior cross country title was won by James Henigan of the Dorchester Club, Boston.

Cornell University captured the intercollegiate championship in a race at New Haven, Conn., Yale finishing second and Syracuse University third. The University of Maine, winner in 1915, had to be content with fourth place, trailing Harvard. The individual honors went to John W. Overton of Yale, with L. H. Carroll of Michigan second.

Arthur V. Roth of the Dorchester Club, Boston, won the American Marathon (25 miles), held under the auspices of the Boston Athletic Association, his time being 2 hours, 27 minutes, 16½ seconds. The All-Western Marathon went to Sidney Hatch of the Illinois A. C. Villar Kyronen of the Millrose A. A., New York, was the victor in the *Evening Mail* Modified Marathon through the streets of New York City (12 miles, 1320 yards). His time was 1 hour, 9 minutes, 10 seconds. Sidney Hatch of the Illinois A. C., ran from Milwaukee, Wis., to Chicago, Ill., a distance of 96.4 miles, in 14 hours, 50 minutes, 30 seconds. See ATHLETICS.

**CROTHERS, RACHEL.** See DRAMA.

**CRUISERS.** See BATTLESHIPS; NAVAL PROGRESS.

**CUBA.** A republic in the West Indies consisting chiefly of the Island of Cuba. The capital is Havana (*Sp. Habana*).

**AREA AND POPULATION.** The area has been estimated at 44,164 square miles, but a more recent statement places it at 44,215 square miles. The following table shows the area as estimated by provinces and the population, according to the census of Sept. 30, 1907, and the calculation of Dec. 31, 1914:

	Square miles	Population	
		1907	1914
Pinar del Río	5,212	240,872	257,781
Havana	3,174	538,010	651,266
Matanzas	3,260	239,812	270,513
Santa Clara	3,266	457,481	569,416
Camagüey	10,078	118,260	154,567
Oriente	14,227	455,088	567,988
Total	44,215	2,048,980	2,471,531

About seven-tenths of the population is white, and nearly three-tenths colored. In 1907, native whites numbered 1,224,539; foreign whites, 203,637; colored, 620,804 (of whom, 274,272 negroes, 334,695 mulattoes, 11,837 Chinese). In 1913, births and deaths were 62,098 and 33,284 respectively; in 1914, 85,317 and 35,887. Immigrants in 1914, 25,911 (of whom, 20,140 Spaniards); in 1915, 32,796. Of the latter number, 24,501 were Spaniards, 2453 Hattians, 1834 Jamaicans, 910 North Americans, 840 Porto Ricans, 714 Mexicans, and 319 British. Married immigrants in 1915 numbered 8906; unmarried, 23,890; those under 14 years of age, 2275; females, 6319. Their money averaged \$19 each. The larger cities of Cuba, with pop-

ulation according to the 1907 census, are: Havana, 297,159 (the population has increased considerably since 1907); Santiago de Cuba, 45,470; Matanzas, 36,009; Cienfuegos, 26,616; Cárdenas, 24,280.

**EDUCATION.** According to the 1907 census, about 31 per cent of the population could not read. Elementary instruction is by law free and compulsory. As reported for June 30, 1915, there were in Cuba 2686 public school houses, with 4931 teachers, an enrollment of 289,692 pupils (149,013 boys, 140,679 girls), and an average attendance of 183,947. The government maintains a secondary school in each of the six provinces; total students in 1916, about 2000. There is a state university at Havana, with three faculties—liberal arts and science, medicine and pharmacy, and law; number of students in 1916, about 1400.

**PRODUCTION AND COMMERCE.** The staple crops are sugar cane and tobacco. Other products are cereals, potatoes and other vegetables, cacao, and fruits, especially pineapples, bananas, oranges, and coconuts. The cultivation of tobacco is most important in Pinar del Rio and makes possible the large industry of cigar and cigarette manufacture. Cuba's tobacco production is not so large as that of some other countries, but it excels all others in the output of material suitable for fine cigars. The country's prosperity is due principally to the enormous production of cane sugar, in which Cuba now leads the world. British India ranks second, but a comparison between the two is hardly significant on account of India's immensely greater area. The Cuban sugar output of 1916 was the largest on record, being 3,007,915 metric tons, as compared with 2,592,667 tons in 1915.

A record sugar output was made in 1873, with about 775,000 metric tons. This quantity was not attained again until 1891, when the output was 819,760 tons. The 1,000,000-ton mark was passed in both 1894 and 1895; then came the war of independence, and in 1896 the output was only 225,221 tons. There was no remarkable increase in production until 1901, with 635,856 tons. Since that year there has been rapid and continuous increase except in 1908, 1911, and 1915. The following table shows for various years Cuba's sugar production in metric tons, the average price in cents per pound, and the total value:

	Tons	Price	Value
1885	681,967	3.08	\$42,892,861
1890	632,368	3.06	43,345,031
1894	1,054,214	2.68	62,105,853
1895	1,004,264	2.02	45,440,932
1896	225,221	2.52	13,066,421
1899	385,668	2.47	18,571,839
1900	800,073	2.83	19,022,227
1901	635,856	2.29	30,182,727
1903	998,873	1.96	43,515,495
1904	1,040,328	2.61	60,815,889
1905	1,163,258	2.79	72,698,971
1907	1,427,673	2.28	71,315,212
1908	961,958	2.56	55,162,519
1909	1,513,562	2.52	85,487,545
1910	1,804,349	2.73	109,985,375
1911	1,483,451	3.02	100,852,486
1912	1,895,984	2.61	110,846,807
1913	2,428,537	1.95	106,078,496
1914	2,597,732	2.64	153,619,479

Cattle raising is an important industry. Number of cattle reported Dec. 31, 1914, 3,394,934; horses, 673,439; mules, 50,023; asses, 2709.

The country has large mineral resources, especially in Oriente, including iron, of which there are immense deposits, manganese, copper, lead, zinc, gold, potash, and salt. The principal minerals worked are copper, manganese, and especially iron. In 1916 large deposits of high-grade potash were reported from Santa Clara.

In the calendar year 1915, imports and exports were valued at \$155,448,233 and \$254,291,763 respectively, as compared with \$119,001,410 and \$177,553,954 in 1914. In the fiscal year 1915, imports and exports were valued at \$128,132,090 and \$219,447,322 respectively, as compared with \$134,008,138 and \$170,796,851 in the fiscal year 1914. The course of the Cuban foreign trade in fiscal years may be seen in the following figures, representing thousands of dollars:

	1910	1911	1912	1913	1914	1915
Imports—	163,446	108,098	120,229	135,810	134,008	128,132
Exports—	144,089	129,179	146,787	165,208	170,797	219,447

The leading imports include breadstuffs, meats, cotton goods, iron and steel, and machinery. Principal export values reported for the fiscal years 1913 and 1914 respectively, in thousands of dollars: raw sugar, 110,857 and 119,743; unmanufactured tobacco, 21,650 and 19,007; manufactured tobacco, 13,914 and 13,775; iron ore, 4238 and 3397; cattle hides, 2383 and 2530; molasses, 1977 and 2429; pineapples, 1318 and 1287; bananas, 817 and 1027; copper ore, 599 and 866; spirits, 665 and 532.

Trade with the great commercial countries, in thousands of dollars:

	Imports		Exports	
	1914	1915	1914	1915
United States	69,805	104,723	148,264	206,164
United Kingdom	12,879	15,288	15,842	33,038
France	4,732	5,197	2,898	1,185
Germany	5,084	800	2,854	0
Total incl. others	119,001	155,448	177,554	254,292

**COMMUNICATIONS.** Wagon roads open to traffic total upwards of 1000 miles, mostly in poor condition. Railway is in operation almost from one end of the island to the other, with connections with the principal towns and seaports. There are four lines, aggregating in 1915 1783 miles; in addition, private railways serving the large sugar estates have a combined length of about 500 miles. A decree was signed on November 16th by the President of the republic granting the Compañia del Ferrocarril del Norte de Vuelta Abajo a subsidy of \$6000 per kilometer (\$9660 per mile) for the construction of a railway between the city of Pinar del Rio and the port of Esperanza on the north coast, with a connecting branch to La Palma. Telegraph offices in 1915, 226; government radiotelegraph stations, 9; post offices, 658.

**FINANCE.** The standard of value is gold. Under a law of Nov. 7, 1914, a new coinage was introduced Dec. 1, 1915, the monetary unit being the gold peso, equivalent to the American dollar. American coinage continues to be a legal tender. For the fiscal year 1916 the budget showed estimated revenue and expenditure of \$41,828,580 and \$40,262,906 respectively. This

budget was continued for the fiscal year 1917. Principal estimated receipts: customs, \$29,100,000; excise, \$3,600,000; lottery, \$3,200,000. Larger estimated disbursements: interior department, \$11,044,249; public instruction, \$5,196,421; public works, \$5,101,666; public debt, \$4,457,963; sanitary service, \$4,261,888. Public debt Jan. 1, 1914, \$67,828,000, of which the foreign debt was \$57,420,000.

**GOVERNMENT.** The executive authority is vested in a president, who, with a vice-president, is elected by indirect vote for four years. The President is not eligible for more than two consecutive terms. He is assisted by a cabinet of eight members, whom he appoints. The legislative power is exercised by a congress of two chambers, the Senate and the House of Representatives. Senators (24 in number, 4 from each province) are elected by indirect vote for eight years; representatives (91) are elected by direct vote for four years. The President in 1916 was Gen. Mario García Menocal, who was inaugurated May 20, 1913, in succession to Gen. José Miguel Gómez. Vice-president, Enrique José Varona.

**HISTORY.** On January 17th, Gen. Mario G. Menocal was renominated for the presidency at the convention of the Conservatives and Gen. Emilio Numez for the vice-presidency. An effort was made to prevent the reelection of President Menocal by passing in the Senate on June 15th, a law which required the resignation of the President sixty days before election. This law, known as the Maza bill, failed, however, in the House, the Liberals falling short of a quorum by one vote, the Conservatives having refused to be present. The Maza bill was vetoed by President Menocal, on July 6th. Congress adjourned without appropriating the \$100,000 required for the monument to the American sailors who lost their lives in the battleship *Maine*. President Menocal and his ministers accordingly diverted to the purpose certain unused appropriations, and made arrangements for the erection of the monument at once. It was to be put up in a small park opposite the Santa Clara battery, and to have a total height of 68 feet. Flags of the United States and Cuba were to be placed at either side. A strike of the cartmen occurred in Havana in the summer and was estimated to have cost \$100,000. The company concerned conceded the point at issue and the strike came to an end on July 21st. The Liberal candidate, Dr. Alfredo Zayas, was supported by ex-President Gomez. On November 5th it was announced that on the election which was held on November 1st, President Menocal, the Conservative candidate, had been reelected, after a close vote. The Liberals, however, disputed the result; a bitter contest followed, and at the close of the year, the situation was reported to be serious. Owing largely to the high price of sugar, prosperous conditions prevailed. The cane crop had increased, and the price per pound of raw sugar was one cent higher than in 1915. Foreign trade figures for 1915 published towards the end of 1916 showed an increase of nearly 40 per cent of total imports and exports during the year.

**CULBERSON, CHARLES A.** Reelected Democratic United States Senator from Texas, Nov. 7, 1916.

**CUMBERLAND PRESBYTERIAN CHURCH.** The work of this denomination in

1916 made steady progress. Owing to litigation the denominational publishing house in Nashville was surrendered in 1913 to the Presbyterian Church in the United States, but in 1916 the board of publication announced the purchase of a new publishing plant and machinery. The *Cumberland Presbyterian*, the denomination's weekly journal, is successfully maintained, and also the publication of the Sunday school periodicals and literature. The board of missions reported a disappointing showing owing largely to the fact that so many presbyteries and synods have organized their own boards of missions, or at least some kind of home mission work restricted within local limits, thus causing a considerable loss to the income of the board of missions for the whole Church. The Sunday school committee's report was highly satisfactory. A larger number of Young People's Societies were organized than in 1915. The board of education reported satisfactory work for 1916. Forty students had been aided in the denominational colleges and in preparation for missionary work. According to the latest available statistics the denomination, including the Cumberland Presbyterian Church (colored), has about 1100 ministers, 1600 churches, and 80,000 communicants.

**CUBAÇAO.** A Dutch West Indian colony, 436 square miles, composed of the islands of Curaçao (212 square miles), Bonaire (Buen Ayre), Aruba, St. Eustatius, and Saba, and part of the Island of St. Martin. Total population, Dec. 31, 1910, 54,469 (24,297 males, 30,172 females); Dec. 31, 1913, 55,183. Export of phosphate in 1911: Curaçao, 3028 cubic meters; Aruba, 27,658 (in 1912, 28,392). Raw gold export in 1912 (Aruba) was valued at 84,561 guilders. Total imports, 3,890,123 guilders; exports, 2,425,541. Vessels entered 1912, 1428 of 2,713,000 cubic meters' capacity at Curaçao, and 1745 of 184,000 at ports of other islands.

**CURRENCY.** See BANKS AND BANKING; COINS, VALUE OF; FINANCIAL REVIEW.

**CURTAIN FIRE.** See MILITARY PROGRESS.

**CURZON, GEORGE NATHANIEL,** first Earl. A British statesman, appointed President of the Council in Lloyd George's cabinet, formed in December, 1916; also a member of the War Council and government leader in the House of Lords. He served as Lord Privy Seal in the Asquith Coalition cabinet, formed in November, 1915. Lord Curzon gained his great reputation as Viceroy and Governor General of India (1899-1905). See GREAT BRITAIN.

**CUSHING, ERNEST WATSON.** An American surgeon, died in Boston Aug. 27, 1916. Born in Boston in 1847, he graduated from Harvard at the age of 20 and three years later at the College of Physicians and Surgeons, New York. From 1874 he practiced in his native city, where he founded the Cushing Hospital and helped to found the Woman's Charity Club Hospital, later known as the Massachusetts Woman's Hospital, of which he was surgeon for 20 years. From 1895 to 1913 Dr. Cushing held the chair of abdominal surgery and gynecology in Tufts Medical School. Tufts gave him the honorary degree of LL.D. in 1898. For 16 years (1887-1903) he edited the *Annals of Gynecology and Pediatrics*. He was one of the earliest demonstrators of the tubercle bacillus.

**CYCLING.** Frank L. Kramer in 1916 won the professional sprint championship for the

fifteenth successive year. He scored a total of 28 points during the season, gathering 5 first places and 1 second. Robert E. Spears of Australia was Kramer's most dangerous rival, with 1 first, 1 second, and 3 thirds for a total of 14 points. The professional paced title went to Clarence Carmen with George Wiley second and Leon Didier third. John L. Staehle won the amateur honors with 28 points, William Spencer being second with 10 points.

Three new records were made in 1916 by R. J. McNamara, who rode a mile in handicap in 1 minute, 45 seconds; 10 miles in 20 minutes, 7½ seconds; and 15 miles in 31 minutes, 28½ seconds.

The annual six-day race held in Madison Square Garden, New York City, was won by the team of Egg and Dupuy, who scored 49 points, the distance traveled being 2624 miles, 4 laps. The other teams to finish in order were: Root and Madden, Spears and McNamara, Kaiser and Cameron, Hill and Drobach, and Walthour and De Baetes.

**CYCLONES.** See FLOODS.

**CYPRUS.** An island in the Mediterranean, annexed in November, 1914, by Great Britain. Area, 3584 square miles; population (1911), 274,108. Estimated population at the end of 1913, about 287,000. Nicosia, the capital, had, in 1911, 16,052 inhabitants. Elementary schools of all classes, in 1914, 610 (414 Christian, 196 Mohammedan), with 739 teachers and an enrollment of 33,805 (27,685 Christians and 6120 Mohammedans). Cereals, carebs, the famous Cyprus wine, cheese, fruit, vegetables, and live stock are exported. In 1913 there were about 67,700 horses, mules, and asses; 60,500 cattle; 265,500 sheep; 255,200 goats; and 37,000 swine. The imports in 1914 were valued, exclusive of specie, at £496,744 (from Great Britain £146,359); the exports at £496,776 (to Great Britain, £162,615). In virtue of proclamations dated March 20, April 3, and May 12, 1916, the export of wheat and barley with their products is prohibited to all destinations; the export of corn, oats, and oatmeal to all destinations other than the United Kingdom, British possessions and protectorates is also prohibited. The export of corn, meal, rice, and rye (with their products) to all foreign countries in Europe and on the Mediterranean and Black seas, other than France, Russia (except through Baltic ports), Italy, Spain, and Portugal, and that of linseed with the further exception of Spain and Portugal, is prohibited. Shipping entered and cleared (1914), £581,926 tons. Revenue (1914-15), £290,110; expenditure, £316,414. A sum of £92,800 was payable annually to Turkey, but this is appropriated to the interest on the guaranteed loan of 1855.

**CYRENAICA.** See LIBYA.

**CYTOLOGY.** See ZOOLOGY, *Cytology*.

**CZERNOWITZ.** See WAR OF THE NATIONS.

**DAHOMÉY.** A French West African colony, one of the component parts of the government-general of French West Africa (q.v.). A recent estimate of population is 910,902. Capital, Porto Novo, with 40,000 inhabitants. Principal products for export are palm kernels, palm oil, dried fish, live animals, copra, cotton, etc.

**DAIRYING.** PROGRESS IN THE UNITED STATES. On January 1, 1915, there were 21,988,000 milch cows in the United States, as compared with 21,262,000 a year earlier. The

milk yield in 1915 is estimated at 11,590,000,000 gallons. The average wholesale price of milk per gallon for the whole United States during 1916, exclusive of December, was 21.24 cents, and during 1915, 20.93 cents. The retail price for the first 11 months in 1916 averaged 29.3 cents per gallon and in 1915 28.23 cents. Census data published during the year show a production in 1914 of 786,013,489 pounds of butter, valued at \$223,179,254; 377,506,109 pounds of cheese, valued at \$50,931,925; and 884,646,761 pounds of condensed milk, valued at \$59,374,946.

In the agricultural extension work of the United States Department of Agriculture in co-operation with the State colleges of agriculture, rapid strides were made during the year in building up the dairy industry in the cotton belt, especially in the cattle-tick-free areas and boll-weevil infested districts. In this region dairy extension work consisted in the main of assistance in the establishment of cow-testing, bull, and other live stock associations; the keeping of private herd records; the building of silos, barns, and dairy houses; the purchase of cattle; the establishment of coöperative creameries and cheese factories; and the improvement of the milk supply of cities. In the West dairy extension work has been along similar lines, but in other parts of the United States, owing to the advanced condition of the dairy industry, work was concentrated upon the development and supervision of organizations which will benefit communities. On October 1st there were in the United States 346 coöperative cow-testing associations with 8886 members and 150,677 cows; and 32 pure-bred bull associations with 650 members who owned 141 bulls and about 6000 cows.

The increased cost of milk production has resulted in demands on the part of producers for higher prices for market milk. The milk dealers in many cases have complied with these demands and have in some cases promptly passed the increase along to the consumers. In other cases there has been severe contest, resulting in strikes on the part of milk producers and attempts to dispose of their milk direct to the consumers, eliminating the contractors and handlers. A plan proposed to eliminate some of the uneconomic features of the present method of delivering milk to consumers in cities is the establishment of municipal distribution. This plan has received widespread agitation during the year. See STRIKES.

The meeting of the National Dairy Show at Springfield, Mass., in October, was the first to be held in the East, all former meetings of the National having been held in Chicago. The exhibit of about 890 head of pure-bred dairy cattle was said to be the largest number of cattle ever brought together in one show. Attendance records for the National were also broken.

Investigations by the United States Dairy Division show that it is feasible to cool hot-bottled milk by forced air under commercial conditions. The Indiana Experiment Station found that when milk is pasteurized at 145° F., holding process, there is no development of cooked flavor and no interference with the rapidity of cream rising. The Dairy Division found small-top pails, clean udders, and sterile utensils to be important factors in securing low bacteria counts in milk. Work at the Illinois Experi-

ment Station showed that dairy utensils and temperature during transportation are the important sources of high bacteria counts in market milk. High bacteria counts in clarified milk as compared with those of milk before clarification were shown by the Iowa Experiment Station to be due to the breaking up of clumps of bacteria during centrifuging. Bacteriologists at the New York Geneva Experiment Station advocate the counting of bacteria in milk by the microscope method. They claim that the plate method reveals only the number of clumps of bacteria present. The Dairy Division demonstrated that the various sediment tests for dirt do not give a clue as to the kind or number of bacteria contained in milk.

In investigating the development of undesirable flavors in cold storage butter the Dairy Division found that this is not due to oxidation of the fat in butter, but to chemical changes resulting from the slow oxidation of non-fatty substances in the buttermilk contained in the butter. The extent of this chemical change is directly proportional to the amount of acidity in the cream from which the butter is made. The Dairy Division has perfected a method of making and ripening cheese of the Roquefort type, and has isolated the bacterium producing the eyes in Swiss or Emmental cheese. These results make it practically certain that these cheeses, which supply the bulk of our cheese imports, can be successfully made in this country.

Nutrition investigations at several of the State experiment stations are having an important bearing on the feeding of dairy cattle. Studies on the mineral metabolism of the milch cow at the Ohio Experiment Station have demonstrated that special attention should be given to the calcium, magnesium, and phosphorous contents of rations of heavily-producing cows in order that the loss of these elements from the skeleton may be kept as low as possible. Especially is a liberal supply of foods which are rich in these elements necessary for cows in the latter part of lactation, in order to refund previous overdrafts before the birth of the next calf. The Missouri Experiment Station has found that the milking functions of the cow when mature are not appreciably affected by the amount of feed nutrients supplied during growth. It has also shown that the tendency of cows which are abundantly fed is to produce normal milk. Investigations at the Wisconsin Experiment Station are having an important bearing upon the compounding of rations, as it has been shown that proteins from different sources differ materially in their ability to produce milk and growth.

DAIRYING IN FOREIGN COUNTRIES. Statistics published during the year show that the number of dairy cows and heifers in England and Wales has increased from an average 1,952,648 in 1881-85 to 2,484,220 in 1914. The estimated milk production for these two countries in 1915 is placed at 1,070,000,000 gallons. During the year ended June 30, 1916, the total imports of butter of the United Kingdom were 148,351 tons, of which about 26,000 tons were from British possessions. The cheese imports for the year were 127,246 tons, of which 102,904 tons came from British possessions. The war has seriously affected Italy's dairy industry. The government has limited the exportation of

cheese, but most Italian cheeses retain their quality for a long time and they have been stored to avoid flooding the market.

The census taken in Switzerland, April 19, 1916, shows an increase of 11.9 per cent in the number of cattle in five years, including 6.5 per cent increase in the number of cows. Owing to increased exports of cheese and condensed milk, and the increased use of cheese as a substitute for meat in the Swiss army, the dairy industry has been very profitable during the year in spite of the high cost of feed. Denmark's exports of butter increased from 95,300 tons in 1914 to 101,600 tons in 1915, and cheese from 500 tons in 1914 to 4300 tons in 1915. The exportation of cream had practically ceased in 1915. It is estimated that 77 per cent of the milk produced in Denmark is handled through coöperative dairies. Statistics published during the year show that, due to systematic selection and feeding, the average annual milk production per cow in Denmark has increased from 3000 pounds to almost 6000 pounds in the last 30 years.

Canada exported during the year 1915, 160,659,808 pounds of cheese, besides trans-shipping a considerable foreign trade in American cheese. During the year ended Aug. 31, 1916, New Zealand exported 40,772,200 pounds of butter and 97,379,100 pounds of cheese.

On account of the scarcity and high price of rennet efforts are being made to discover ways of limiting its use in cheese making. Experiments at the Finch and Guelph experiment stations in Canada show that pepsin of good quality or a mixture of pepsin and rennet can be successfully used in cheese making. At the Hoorn Experiment Station in Holland, Edam cheese was successfully made by the use of one-half the usual amount of rennet and adding 40 c.c. of hydrochloric acid per 100 litres of milk. Equally successful was the use of one-fourth the normal amount of rennet and the addition of 40 gm. of water-free calcium chlorid per 100 litres of milk. Pepsin was found to be a satisfactory substitute for rennet. Experiments in Sweden demonstrate that a pasteurization temperature of 145° F. for from 20 to 30 minutes does not affect the taste of the milk, the rising of the cream, or the composition of the protein and soluble phosphates. Pasteurizing milk at 149° F. seriously affected it in all these points.

DAIRY RECORDS. The following are some of the high production records made in 1916: The 4-year-old Holstein heifer, Queen Piebe Mercedes, finished a year's test with a production of 30,230 pounds of milk and 1111 pounds of fat. This is said to be the only heifer in the world with 30,000 pounds of milk to her credit. The Red Poll cow, Muria, produced in one year 14,972 pounds of milk containing 884 pounds of fat, which is said to be a record for this breed.

LITERATURE. The following is a list of some of the important dairy literature of the year: S. H. Ayers, J. T. Bowen, and W. T. Johnson, "Cooling Hot-bottled Pasteurized Milk by Forced Air," in *United States Department of Agriculture Bulletin* 420 (Washington, 1916); R. S. Breed and J. D. Brew, "Counting Bacteria by Means of the Microscope," in *New York State Experiment Station Technical Bulletin* 49 (Geneva, N. Y., 1916); H. C. Campbell,

"Comparison of the Bacterial Count of Milk with the Sediment or Dirt Test," in *United States Department of Agriculture Bulletin* 361 (Washington, 1916); Janet E. Lane Clayton, *Milk and Its Hygienic Relations* (London, 1916); D. C. Dyer, "Progressive Oxidation of Cold-Storage Butter," in *Journal of Agricultural Research* (Washington, Sept. 11, 1916); E. B. Forbes, F. M. Beegle, et al., "The Mineral Metabolism of Milch Cows," in *Ohio Experiment Station Bulletin* 295 (Columbus, Ohio, 1916); C. H. Eckles and L. S. Palmer, "The Influence of the Plane of Nutrition of the Cow upon the Composition and Properties of the Milk and Butter Fat: Influence of Overfeeding," in *Missouri Experiment Station Research Bulletin* 24 (Columbia, Mo., 1916); W. Fleischmann, *Lehrbuch der milchwirtschaft* (5th ed., rev., Berlin, 1915); B. H. Hibbard and A. Hobson, "The Marketing of Wisconsin Butter," in *Wisconsin Experiment Station Bulletin* 270 (Madison, Wis., 1916); C. H. Kilbourne, *The Pasteurization of Milk from a Practical Viewpoint* (New York, 1916); C. W. Larson, *Milk Production Cost Accounts* (New York, 1916); H. S. Reed and R. R. Reynolds, "The Effect of Temperature on the Growth and Activity of Bacteria in Milk," in *Virginia Experiment Station Technical Bulletin* 10 (Blacksburg, Va., 1916).

**DAKIN'S SOLUTION.** An antiseptic liquid produced by the action of sodium carbonate on a solution of chlorinated lime; the resulting fluid, after being siphoned off from the precipitate of calcium carbonate and filtered, is neutralized with boric acid. Chlorinated lime and Labarraque's solution (chlorinated soda) are well known disinfectants, the difference between the latter and Dakin's solution being the addition of boric acid, for the purpose of neutralization. This solution has been used for irrigating wounds and rendering them aseptic, in French military hospitals during 1915-17.

Dakin (Dr. H. D. Dakin, director of the Herter Laboratories in New York, but now serving as bacteriologist in France) disclaims originality for the antiseptic, which was discovered by Berthollet in 1788. The antiseptic value of hypochlorous acid has been attributed to its ready decomposition in the presence of organic matter with the liberation of oxygen. Dakin, however, believes that its antiseptic action is due, not to the liberation of oxygen, but to the formation of chloroamide groups in the protein, and that these in time may give rise to the antiseptic action. In either case, according to the modern conceptions of the liberation of electrons, the reaction would be interpreted as one of oxidation. It is generally held that all results justify the conclusion that hypochlorites whether applied in acid, alkaline, or neutral solutions, are of great value in the treatment of infected wounds.

Stimson, of New York, gives the exact formula and directions as he received them from Dr. Alexis Carrel, of New York, at Campiagne. He states that all the wounds treated with the solution at this place looked healthy and clean, while those observed in some other places were brown and unhealthy, due in all probability to faulty preparation and the persistence of alkalinity. The formula is as follows: Chlorinated lime (bleaching powder) 200 gm.; sodium carbonate, dry, 100 gm.; sodium bicar-

bonate, 80 gm. Put the chlorinated lime (2) in a 12-litre flask with five litres of ordinary water, and let stand over night. Dissolve the sodium carbonate and bicarbonate (3) in five litres of cold water. Pour (3) in the flask containing (2), shake it vigorously for a minute, and let stand to permit the calcium carbonate to settle. After half an hour siphon off the clear liquid and filter it through paper. The resultant is perfectly limpid. It must be kept protected from the light. The antiseptic solution is then ready for surgical use. It contains about 0.5 gm. per cent of sodium hypochlorite with small amounts of neutral soda salts, and is practically isotonic with blood serum. See SURGERY.

**DAMS.** The construction of dams and reservoirs by the United States Reclamation Service by the end of 1916 had reached a point where the dams of masonry, earth, and rock fill had totaled a volume of 12,300,000 cubic yards, and included four of the highest dams in the world. The reservoirs thus formed would contain sufficient water to cover the States of New Jersey and Delaware to a depth of 12 inches. Indeed in the United States practically every variety of dam known to engineering practice has been constructed and in many instances in dimensions far in excess of those built in other countries.

**FEDERAL LEGISLATION.** Legislation to permit the construction of power dams in navigable streams by private companies again figured in the United States Congress in 1916, and the general Dam bill providing for a system of leases under government regulation and designed to induce private investment in water power development, was passed by the House of Representatives on July 14th. Later in the summer conferees of the Senate and House of Representatives endeavored to reconcile differences in their respective measures but were unable to come to any agreement.

**THE ELEPHANT BUTTE DAM,** on the Rio Grande River, about 14 miles west of Engle, N. M., and the main structure in the Rio Grande project of the United States Reclamation Service, was completed on May 13, 1916. The dam, progress on which has been noted in the YEAR BOOKS for 1911, 1913, 1914, and 1915, is of rubble concrete with a gravity section and straight plan. It is 1200 feet long, at the roadway surface, 203.5 feet high above the original river surface, and 304.5 feet from deepest excavation to top of parapet wall. The maximum width at base is 215 feet and the roadway top is 16 feet. It contains 550,000 cubic yards of masonry. A reservoir is created 45 miles long and with 42,000 acre area, containing when full 115,098 million cubic feet.

The Elephant Butte Dam was formally dedicated October 19th, under the auspices of the International Irrigation Congress, which was in session at El Paso, the rain having caused the postponement of the ceremonies from October 14th. The principal address was made by A. A. Jones, First Assistant Secretary of the Interior, who was present as the personal representative of President Wilson. A. P. Davis, director and chief engineer of the United States Reclamation Service, discussed the engineering phases of the dam, the question of the reservoir filling with silt, and some of the different remedies therefor. E. H. Baldwin, construction engineer

of the dam, and later senior engineer and project manager of the Rio Grande project, also made a short address covering the operations during construction.

It might be said that an investigation of the silting probabilities based on the probable inflow of silt into the reservoir area of 2,638,860 acre-feet indicated a service life of 233 years according to estimates made by R. R. Coghlan and V. E. Lieb.

**YADKIN RIVER DAM.** After 15 years of development and exploitation, the hydro-electric project with the great Yadkin Narrows Dam near Stanley, N. C., was nearing completion in 1916. The dam under construction is of solid concrete 1400 feet in length, and 217 feet in height, and contains 525,000 cubic yards of concrete or slightly less in amount than the Elephant Butte Dam described above, thus being one of the largest concrete dams in the world. It was the highest overfall type dam up to 1916 and was built in vertical blocks of about 50-foot width measured on the upstream face. The dam is of gravity section curved, with a radius of 1678 feet and the weight of the cyclopean concrete employed is unusually great, being 162.5 pounds per cubic foot, due in large measure to the high specific gravity of the porphyry aggregate. Except for 450 feet of wing on the west end and 100 feet at the east end the overfall section occupies the entire length. The Yadkin Narrows Dam was of interest as it is the final result of a series of developments planned for this district where it was proposed to establish a large aluminium industry. Previous to 1907 a long low cut stone dam costing about a half million dollars was built across the river but was abandoned when a French concern, the Southern Aluminium Company, entered the field with a project for a curved non-overflow gravity section concrete dam 1350 feet in length and a maximum height of 200 feet, forming a reservoir of about 8 square miles area. The outlets for flood overflow were through a couple of 60-foot wells and tunnels. In 1914 the European war halted the work of the French company and the Tallahassee Power Co., a subsidiary of the Aluminium Company of America, acquired the site and proceeded to modify the plans of the French engineers according to American practice, converting the dam into an overfall section clear across the river and using a spillway bypass channel instead of wells and tunnels. The power house immediately below the dam was built for four 31,000 horse power generating units (see **TURBINES**), three of which were being installed in 1916, these being the largest turbine units ever built. The work of construction was somewhat interfered with by the July floods in North Carolina, but substantial progress was being made. The dam and its construction are fully described in *Engineering Record* for November 18th, and *Engineering News* for November 16th.

**CALAVERAS EARTH DAM.** Work continued during 1916 on the Calaveras Earth Dam (see **YEAR BOOKS** for 1914 and 1915) which, with its 240 feet of height, 3,000,000 cubic feet of fill, was the highest earth dam undertaken. At the end of the year about one-half of the yardage had been deposited by hydraulic method in the great embankment which for volume was second to the Gatun Dam at Panama. The crest length of the dam is 1300 feet

and the base width 1300 feet, the upstream slope being 3:1 and the downstream slope  $2\frac{1}{2}$ :1. The reservoir outlet consists of a concrete culvert 1300 feet long with a cross section of 234 square feet, which follows the original stream channel beneath the dam, and by means of a reinforced concrete tower 225 feet high at its upper end provides an outlet. The direct cost of sluicing the first million cubic yards of fill was about 25 cents per cubic yard, exclusive of overhead expenses. The progress made in 1916 indicated the completion of the dam by 1918. A discussion of the work by G. A. Elliott, engineer in charge, will be found in *Engineering Record*, Aug. 19, 1916.

**NOGUERRA PALARESA RIVER DAM.** During the year a large dam was built across the Noguerra Palareza River in a chasm near the town of Talara, near Barcelona, Spain, from plans by American engineers and under their supervision. This dam, which abuts on almost perpendicular cliffs, was built of concrete, 330 feet in height and 700 feet in length, being 230 feet thick at the base and gradually decreasing to 14 feet at the top. The dam provides an artificial lake  $15\frac{1}{2}$  miles long by  $3\frac{3}{4}$  miles wide, from which water is drawn both for power and irrigation. The natural formation of the rock permitted the construction of a spillway with a capacity of 70,000 cubic feet a second, while there is a canal system which provides for the irrigation of an arid district of nearly 100 square miles. The power plant in 1916 was yielding 20,000 horse power of electric current, and it was to be doubled shortly. In the construction of the dam modern American methods and machinery were extensively employed and the cement used was made from limestone and marl in the neighborhood and transported to the dam site by a temporary railway. The cement-making machinery, stone crushers, mixers, etc., as well as other machinery, including traction engines and cars, were imported from the United States.

**GABLENZ.** In September the newspapers reported the failure of a dam near Gablenz, Bohemia, which resulted in more than 300 deaths and heavy property losses. Several villages were reported inundated and, while no bridges have failed, many were said to be impaired.

The structure that failed was believed by engineers to be one of the old dams built several hundred years ago, as the newer structures in the mountainous districts of Silesia are of excellent design and well constructed. They are used only to safeguard life and property and to make the streams navigable. See **FLOODS**.

**DANBY, FRANK.** An English author, whose real name was Mrs. Julia Frankau, died in London, March 17, 1916. Born in 1864, the daughter of an artist, she was educated at home by Mme. Paul Lafargue, whose father was Karl Marx. At 19 she was married to Arthur Frankau, a merchant. Her early literary work consisted of contributions to the *Saturday Review* and other journals. After writing two novels, Mrs. Frankau, for some years, turned to the study of engraving, publishing in this field *Eighteenth Century Color Prints* (1900), *Life of John Raphael Smith* (1902), and *Lives of James and William Ward* (1904). Among the novels which appeared between 1902 and her death were: *Pigs in Clover*, *Baccarat*, *The Sphinx's Lawyer*, *The Heart of a Child*, *Let*

*the Roof Fall In, Concert Pitch, Full Swing, and Twilight.* In 1910 appeared, in two volumes, *The Story of Emma, Lady Hamilton.*

**DANIELS, JOSEPHUS.** See UNITED STATES.

**DANISH LITERATURE.** See SCANDINAVIAN LITERATURE.

**DANISH WEST INDIES.** A colony of Denmark, made up of three West Indian islands—Saint Croix, 84 square miles; Saint Thomas, 33; and Saint John, 21. Sugar is the principal product for export.

**DARTMOUTH COLLEGE.** A non-sectarian educational institution for men at Hanover, N. H. It was founded in 1769. In the autumn of 1916 the total enrollment was 1494. The faculty numbered 123 and there were 13 officers of administration. Dr. Ernest Fox Nichols, president of the college, resigned his office, and on October 6th Ernest Martin Hopkins, who had been secretary of the institution, was installed as his successor. During the year the following instructors retired: John K. Lord, professor of Latin; James F. Colby, professor of political science; Charles H. Morse, music director. The college received \$75,000 from Wallace F. Robinson of Boston. Productive funds amounting to \$4,184,586 yielded an income of \$166,300. The year's income was \$400,000. In the library are 130,000 volumes.

**DAVIS, HENRY GASSAWAY.** An American capitalist and ex-Senator, died at the home of his daughter, Mrs. Stephen B. Elkins, in Washington, D. C., March 11, 1916. He was born at Woodstock, near Baltimore, Md., in 1823, and after a country-school education went to work on a farm. At 19 he became a brakeman on the Baltimore and Ohio, later conductor, and agent at Piedmont. To develop, with his brothers, the opportunities which he was the first to appreciate, of shipping coal and lumber from the Piedmont region, Mr. Davis resigned his railway connection, and began to buy up large tracts of land in Maryland and West Virginia. Gradually he built several communities, among them Deer Park, Md., and Elkins, W. Va., his summer and winter homes, respectively, and to these towns he gave various buildings. The West Virginia Central and Pittsburgh Railway, sold to the Wabash in 1902, and the Coal and Coke Railway of West Virginia were built by Mr. Davis. His political career began in 1865, when he was elected to the West Virginia House of Delegates; this was followed by a term in the State Senate; and from 1871 to 1883 he served as United States Senator, declining nomination for a third term. Although a Democrat, Mr. Davis gained the support of many Republicans, and held appointments under Republican Presidents, as member of the first and chairman of the second Pan-American Conference, and chairman of the Intercontinental Railway Commission. While in the Senate he served on the Committee on Appropriations and the Committee on Transportation Routes to the Seaboard. At 81 he was nominated by the Democratic National Convention of 1904 for the vice-presidency, to run with Judge Alton B. Parker; despite his age he took an active part in the campaign, both by speeches and writings. At the time of his death he was supposed to be worth about \$30,000,000.

**DAVIS, HORACE** An American educator and manufacturer, died in San Francisco July 13, 1916. Born in Worcester, Mass., in 1831, he

graduated from Harvard in 1849, and then studied law; but after three years he went to San Francisco, where he entered manufacturing. Identifying himself with Republican politics, he served as a representative in Congress from 1877 to 1881, and from 1880 to 1888 as a member of the Republican National Committee. For three years (1887-90) Mr. Davis was president of the University of California. Other educational institutions with which he was connected were Leland Stanford, of which he had been president of the board, and the California School of Mechanic Arts, of which he was president. In religious denominational work also he was prominent, at one time holding the presidency of the National Conference of Unitarian Churches and the vice-presidency of the American Unitarian Association. He wrote on *American Constitutions, The Public Ministry of Jesus, Shakespeare's Sonnets*, etc. The University of California, Harvard, and the University of the Pacific gave him the degree of LL.D.

**DAVIS, JOHN KING.** See POLAR RESEARCH, *Antarctic.*

**DAVIS, RICHARD HARDING.** An American story writer and war correspondent, died at his home, Cross Roads Farm, near Mt. Kisco, Westchester County, N. Y., April 11, 1916. The son of L. Clarke Davis, noted as editor of the Philadelphia *Public Ledger*, and of Rebecca Harding Davis, who for many years was a writer of magazine stories, Mr. Davis was born in Philadelphia April 18, 1864. He was educated at the Episcopal Academy in Philadelphia, at Lehigh University, and at Johns Hopkins. In 1887 he began newspaper work in Philadelphia, on the *Record*; later he was a reporter for the *Press* and the *Telegraph*, in the same city, gaining an early reputation by his account of the Johnstown flood. While in London, as special correspondent with a Philadelphia cricket team, he got material on the Whitechapel murders, which were committed at that time. In 1890 he joined the staff of the *Evening Sun* of New York, of which Arthur Brisbane was then managing editor, and for three years, from 1891, was himself managing editor of *Harper's Weekly*. Soon after coming to New York he gained his first success as a story writer with "Gallagher," recounting the adventures of a "cub" reporter, and one of the best things he ever wrote, which was published in *Scribner's*. Then came the first of the Van Bibber stories, and in 1895 his first long story, *The Princess Aline*.

Mr. Davis did his earliest work as a war correspondent, a field in which he was to take a foremost place among American newspaper men, when he reported for the London *Times* the Græco-Turkish War in 1897. His writing at this time attracted attention in Europe and America. It was the precursor of much similar work, for from then on there was hardly a war or a revolt that Davis was not sent out as correspondent by some paper—the Cuban insurrection, the Spanish-American War, the South African War, the Russo-Japanese War, the Balkan Wars, and the great European war. After the invasion of Belgium by Germany in 1914, he had exciting experiences, and barely escaped with his life. Later on he went to Saloniki and accompanied the French and British armies in their retreat from Serbia, and he had been home only a few weeks before the strain and hardships he had suffered had

their effect, and he died suddenly from angina pectoris. He was an intense partisan of the Allies. At the time of his death he was at work on a new book, *With the French in France and Salonika*.

Richard Harding Davis will probably be remembered longest for his stories of romantic adventure, especially those dealing with political upheavals in Latin America. These represent a counterpart of Anthony Hope's stories, such as *The Prisoner of Zenda*, and at once took popular fancy. The first to be published, *Soldiers of Fortune* (1889), is not only representative of the type, but it is the best known and was best liked by Davis himself. Other titles to be mentioned include: *Captain Macklin* (1902); *The Bar Sinister* (1904); and *Vera the Medium* (1908). Besides these are many collections of stories, volumes relating to his adventures as a correspondent, books for boys, and accounts of travel, some 30 in all. Several of his books were turned into plays or appeared originally as such, among the most successful being *The Dictator* and *The Galloper*. Mr. Davis possessed a remarkable personality that seemed to be a curious incarnation of one of the adventurous, proud, and good-hearted "soldiers of fortune" that he delighted to picture; yet at the same time, his life was one of unremitting labor.

**DAWSON, JACKSON.** See **HORTICULTURE, Necrology.**

**DAYLIGHT SAVING.** In the spring of 1916 there was adopted in Europe generally a change in the ordinary reckoning of time by the arbitrary putting forward of the hands of the clock one hour, so as to secure a readjustment of daily occupations to a period of greater daylight. This was done in April or May and in the following September or October the clocks were put back an hour. The advantages claimed were increased use of daylight in place of artificial illumination and an attempt to approximate the same relative distribution of a person's activities in summer as in winter as regards light and darkness. The plan was in no way novel, having been suggested in France in April, 1784, by Benjamin Franklin in a contribution to the *Journal de Paris*, "Economical Project for Diminishing the Cost of Light." In its modern aspect, however, the Daylight Saving movement may be said to date from the publication of a small work, *The Waste of Daylight*, by William Willett, a British builder, in 1907. The first fruit of this propaganda, which soon was destined to become world wide, was the introduction of a "Daylight Saving" bill into the British Parliament in 1908, but the measure failed of passage and Willett died before the successful issue of the movement was realized. In 1909 and 1911 similar bills failed in Parliament, but the cause was agitated on the Continent and by 1916 it became well rooted. On April 6th, the German Federal council passed a statute providing on May 1st for setting forward the clocks one hour, and this date was so observed. Later in the month, despite the objections of members of the Académie des Sciences, there was passed by the Chamber of Deputies in France the Honnorat bill with the same purpose in view. This measure was advanced by the government as a measure of economy providing for the saving of light and fuel and on this basis was passed without formal op-

position. The House of Commons agreed to "Daylight Saving" as a provisional war measure on May 8th, and on May 20th, at midnight the clocks were duly put forward one hour. On May 1st the clocks in Holland were set ahead, and on May 22nd those in Norway. Austria, Denmark, Sweden, Switzerland, Italy, Spain, Portugal, and Turkey all adopted this new "summer time" and it was accordingly in use until September 30th, when the clocks were put back and standard of Greenwich time resumed. In North America the new scheme was actually introduced in Nova Scotia, and there was an active propaganda in the United States and Canada. Bills were introduced into Congress and associations to further the movement were formed.

In the United States, however, standard time was first developed and by the coöperation of the railways and other agencies an efficient system was adopted. That "Daylight Saving" would break down this system it is impossible to assert, yet it was feared that it might lead to a general overhauling and alteration of some of its fundamental principles. Accordingly at the meeting of the American Railway Association in November, the Committee on Standard Time reported on the Daylight Saving movement and stated that the correct stand for the railroads to maintain was

"1. That the present zone system of dividing time is scientifically correct.

"2. That any change in the sub-division of time would result in endless confusion, and would be disastrous to the railroads.

"3. That in the event of a nation-wide movement to change the hands of the clock in order to readjust the hours of daylight to the hours of labor, the railroads should not antagonize the movement. The railroads will not suffer any very serious inconvenience by the change as proposed, although such a change from a scientific standpoint is not warranted nor is the committee in sympathy with the movement. The railroads should not agree to the 'daylight saving' project until it has been previously adopted by the principal business and municipal centres and the State and local authorities. Unless a change of the character proposed can be made on the same date throughout the country it will lead to great confusion and difficulty."

The report was approved.

**DEATH RATE.** See **VITAL STATISTICS.**

**DE BACA, E. C.** Elected Democratic Governor of New Mexico, Nov. 7, 1916.

**DE COPPET, EDWARD J.** An American banker and patron of music, died in New York April 30, 1916. He was born in New York in 1855 and succeeded to his father's interests in Wall Street, from 1891 being head of the firm of De Coppet and Doremus. His fondness for chamber music, especially for the string quartet, led Mr. De Coppet to have musical organizations play for him at his villa on Lake Geneva in Switzerland, and in 1902 he brought together four musicians who were to devote themselves to perfecting their ensemble for the enjoyment of their patron and his guests. This quartet, called the Flonzaley Quartet, from the name of the De Coppet villa, soon gained such a reputation that they began to give public concerts in New York, on tour in the United States, and in Europe, where they came to be held in the highest esteem. Latterly, Mr. De Coppet had retained

their services but for 12 weeks of the year. The quartet had just played for him one of his favorite compositions, when he died.

**DEDEKIND, J. WILHELM RICHARD.** A German mathematician, died at Brunswick, Germany, Feb. 12, 1916. He was born at Brunswick and studied at the university there and at Göttingen (Ph.D., 1852). After several years as a teacher at Göttingen, he went to the Zurich Polytechnic in 1858 as professor of mathematics, and from 1862 till his death held a chair in the technical school at Brunswick. Professor Dedekind's international reputation brought him membership in the academies of science of Göttingen, Berlin, Paris, Rome, and Zurich. He published *Was sind und was sollen die Zahlen?* (2d ed., 1893), and edited *Vorlesungen über Zahlentheorie* (4th ed., 1894).

**DEFECTIVES.** See CHARITIES; PENOLOGY.

**DEFENSE, NATIONAL.** See NAVAL PROGRESS.

**DELAWARE. POPULATION.** The estimated population of the State at the end of 1916 was 214,270. The population in 1910 was 202,322.

**AGRICULTURE.** The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1915-16 were as follows:

		Acreage	Prod. Bu.	Value
Corn	1916	205,000	6,970,000	\$6,203,000
	1915	210,000	6,615,000	4,101,000
Wheat	1916	124,000	1,860,000	3,013,000
	1915	125,000	1,875,000	2,044,000
Oats	1916	4,000	120,000	74,000
	1915	4,000	184,000	68,000
Potatoes	1916	10,000	900,000	1,125,000
	1915	11,000	1,045,000	784,000
Hay	1916	80,000	116,000	1,844,000
	1915	70,000	84,000	1,428,000
Rye	1916	1,000	15,000	18,000
	1915	1,000	16,000	16,000

a Tons.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned, in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments	726	808
Average number of wage earners	21,288	22,155
Capital invested	\$60,906,000	\$69,324,000
Wages	10,296,000	11,382,000
The value of materials used	30,938,000	31,649,000
The value of products	52,840,000	56,085,000

**TRANSPORTATION.** The mileage of the railroads operating in Delaware in 1916 was as follows: Wilmington and Philadelphia Traction Company, 89.25 miles; Wilmington, New Castle, and Delaware City, 15.65 miles; People's Railway Company, 29.88 miles.

**EDUCATION.** The total enrollment in the public schools of the State in 1916 was 32,511. The average daily attendance was 13,179. There were 101 male teachers and 493 female teachers. The average yearly salary of male teachers was \$492.93, and females \$363.34.

**FINANCE.** The latest report of the financial condition of the State is for 1914, when the total receipts amounted to \$685,203, and the disbursements to \$716,653. There was a balance at the beginning of the year of \$45,797, and at the end of the year of \$14,418.

**CHARITIES AND CORRECTIONS.** There was no board supervising charitable and correctional institutions. The Associate Charities of Wilmington has a director in direct supervision over many philanthropic institutions. These include the Home for Friendless Children, the Home for Aged Women, St. Joseph's School for Orphan Colored Boys, the Florence Crittendon Home, the Delaware Industrial School for Girls, Home of Merciful Rest, and the Layton Home for Colored Persons, all at Wilmington. There are in addition several institutions in Dover and Marshalltown, the Delaware Hospital for the Insane at Farnhurst, and the New Castle County Hospital. The Delaware State Tuberculosis Commission has general charge of the work for the prevention and cure of this disease.

**POLITICS AND GOVERNMENT.** The campaign in Delaware in 1916 resulted in several surprises. The greatest of these was the defeat of Henry A. du Pont for reelection to the United States Senate by Josiah Walcott. Thomas W. Miller, son of the Governor, lost his seat in Congress after having filled it for one term. He was succeeded by a Democrat, A. L. Polk. John G. Townsend, nominated by the Republicans and Progressives, was elected, defeating John G. Hughes, and David G. Reinhardt was elected Attorney General by the Republicans and Progressives, defeating Armon D. Chaytor. In the vote for President, Mr. Hughes carried the vote. A fight was made on the Republican organization by Alfred J. du Pont, chiefly against his cousin, D. Coleman du Pont, who led the Republican organization, and who was fighting for Henry A. du Pont and Thomas W. Miller for Congress. A Progressive ticket was named, with Dr. Hiram Burton, former member of Congress, as the nominee for Senator. John G. Townsend for Governor. The Democrats, on the whole, showed gains in the election. In the voting for Governor J. H. Hughes received 24,350 and J. G. Townsend 26,648. For United States Senator, Walcott, Democrat, received 25,416, and du Pont, 22,925. For President, Hughes received 26,011 votes, and Wilson, 24,753. For Attorney General, Reinhardt, Republican, received 25,539, and Chaytor, 25,184. In the Senate were elected 7 Democrats and 10 Republicans, and in the House of Representatives, 8 Democrats and 2 Republicans.

**STATE OFFICERS.** Governor, John G. Townsend, Jr.; Lieutenant-Governor, Lewis E. Eliason; Secretary of State, George H. Hall; Attorney General, David J. Reinhardt; State Treasurer, William J. Swain; Auditor of Accounts, William G. Roe; Commissioner of Insurance and Banking, Thomas R. Wilson; State Librarian, Thomas W. Wilson; Commissioner of Education, Dr. Charles A. Wagner.

**JUDICIARY.** Supreme Court: Chancellor, Charles M. Curtis; Chief Justice, James Pennewill; Associate Justices, William H. Boyce, Henry C. Conrad, Herbert L. Rice, T. B. Heisel; Clerk, Wilbur D. Wilds.

STATE LEGISLATURE:

	Senate	House	Joint Ballot
Democrats	7	19	26
Republicans	10	16	26
Majority	3 R	3 D	..

**DELBOS, VICTOR.** See PHILOSOPHY.

**DENMAN, WILLIAM.** See SHIPPING BOARD, UNITED STATES.

**DENMARK.** A constitutional European monarchy, hereditary in the male line of the Schleswig-Holstein-Sonderbourg-Glücksabourg branch of the house of Oldenbourg. It is situated north of Germany, between the North and Baltic seas. Copenhagen is the capital.

**AREA AND POPULATION.** The area and population by insular and mainland divisions, according to the census taken Feb. 1, 1911, compared with the figures for population in 1906, are shown in the following table:

Islands:	Sq. m.	Pop. 1911
Seeland .....	2,895	1,096,897
Bornhojn .....	227	42,885
Lolland-Falster .....	692	115,658
Fyn .....	1,341	303,179
<b>Jutland:</b>		
Southeast Jutland .....	2,827	482,264
Southwest Jutland .....	4,144	364,620
North Jutland .....	2,920	351,573
<b>Total Denmark proper .....</b>	<b>15,046</b>	<b>2,757,076</b>
Faroe Islands .....	540	18,000
<b>Total .....</b>	<b>15,586</b>	<b>2,775,076</b>

The rural population in 1911 numbered 1,647,350, the urban, 1,109,726. Copenhagen (Köbenhavn), covering 28 square miles, had (1911) 462,161 inhabitants; Fredericksberg, 97,237; Aarhus, 61,755; Odense, 42,237; Aalborg, 33,449; Horsens, 23,843; Randers, 22,970; Esbjerg, 18,208; Vejle, 17,261; Fredericia, 14,228; Kolding, 14,219; Helsingör, 13,783; Svendborg, 12,667; Nyköbing, 11,010; Viborg, 10,885; Slagelse, 10,463. Engaged in and dependent upon agricultural occupations (1911) were 1,019,382 persons; in trades, 755,004; commerce, etc., 314,923; transportation, 167,196; etc. Of the total population, 2,655,522 were Danes, and with regard to religion, 2,715,187 were Lutherans.

In 1914 there were 19,757 marriages, 75,022 births, 37,648 deaths (stillbirths included), and 6263 emigrants. Marriages in 1913 numbered 20,460 (20,533 in 1912); living births were 72,465 (74,651); stillbirths, 1734 (1754); and deaths, 35,378 (36,481).

**PRODUCTION.** Agriculture and dairying are the principal industries. About 80 per cent of the total area is productive; less than one-half the productive area is under crop, the remainder being forest, pasture, and meadow. The total cropped area in 1907 was 3,896,870 hectares, divided as follows: 1,122,761 hectares under cereals, 308,362 under roots, 27,247 under industrial plants, 1,229,585 under grasses (including meadows, pastures, and sown forage), 230,413 fallow, 978,502 other (including gardens, parks, etc.).

An English source gives the following figures for area planted to main crops and production in 1915 with comparative figures for production only in 1914:

	1915		1914	
	Acres	Bu.	Bu.	Bu.
Wheat .....	166,292	7,788,000	5,605,981	
Barley .....	651,153	25,091,000	20,137,861	
Oats .....	1,035,850	41,533,250	37,458,212	
Rye .....	526,287	12,597,750	9,578,113	
Potatoes .....	166,407		86,179,000	
Beets .....	698,630		493,790,000	

Dairying is an important industry. Creameries in operation in 1911, 681, with 104,557 work people; the milk employed was from 605,208 cows, with an average production of 2570 kilos of milk per cow. The live stock censuses of July 15, 1909, and July 15, 1914, returned 535,018 horses and 568,240, respectively; cattle, 2,253,982 and 2,462,862 (of which, cows, 1,281,674 and 1,310,268); sheep, 726,879 and 514,918; swine, 1,467,822 and 2,496,661; goats, 40,257 and 40,670; fowls, 11,815,783 and 15,153,999.

The manufactures are chiefly for home consumption, the exports consisting largely of agricultural products. See AGRICULTURAL EXPERIMENT STATIONS; DAIRYING.

**COMMERCE, ETC.** By law dated August 6, 1914, the export of cereals, flour, and fodder has been prohibited since that date. By ministerial order dated October 29, 1914, the export of cotton has been prohibited since the latter date. By ministerial order of December 11, 1914, the export of linseed has been prohibited from that date. As regards goods in transit and transshipment, all such, if of a kind prohibited to be exported from Denmark, are covered by prohibition unless they are on a through bill of lading to a port in a foreign (non-Danish) country. The prohibition is therefore applicable in cases where the goods are either shipped to a Danish port, to order, or where the goods are redesigned to another port than that originally mentioned in the bill of lading. The ministry of justice grants licenses to export certain goods, as above, but such licenses are valid only for one month from date.

The general and special trade is shown below in kroner:

Imports:	1913	1913	1914
General ...	817,512,000	855,351,000	795,288,000
Special ...	740,015,000	777,424,000	717,787,000
<b>Exports:</b>			
General ...	682,082,000	721,290,000	867,446,000
Special ...	596,723,000	637,360,000	780,226,000

A table of principal articles of import and export follows, values in thousands of kroner:

Imports	1000 kr.	Exports	1000 kr.
Cereals .....	86,466	Butter .....	213,018
Oilcake .....	59,835	Meat .....	205,443
Fuel .....	59,833	Animals .....	160,534
Wood .....	38,102	Eggs .....	36,246
Iron mfrs. ....	27,502	Skins .....	18,663
Veg. fibres. ....	24,007	Fish .....	11,720
Iron .....	19,561	Barley .....	11,276
Animals .....	17,842	Ships .....	5,439
Woolens .....	16,975	Iron mfrs. ....	8,451

Germany furnished imports and received exports valued at 264,653 and 301,424 thousand kroner respectively; Great Britain, 145,137 and 431,605; Sweden, 83,097 and 37,960; Russia, 40,490 and 14,006; Netherlands, 22,551 and 2241; Norway, 17,475 and 22,843.

Vessels entered in the 1914 trade, 34,086, of 4,268,099 tons. Merchant marine (Jan. 1, 1914), 4386 vessels, of 566,727 tons.

Railways in operation at end of 1913, 2390 miles (1243 State owned); state telegraph service (1914), 8373 miles; telephone wires, 342,522 miles; post offices, 1171.

**FINANCE.** Revenue and expenditure for comparative years are shown below, in kroner; A—receipts and expenditures current; B—receipts

from investments and funding of debt and expenses for improvements on domains and reduction of debt:

	1912-13	1913-14	1914-15
Rev. A . . . .	114,175,582	123,874,961	121,780,782
Rev. B . . . .	80,342,814	4,209,088	84,894,354
Exp. A . . . .	106,882,288	111,404,448	156,180,163
Exp. B . . . .	83,601,075	12,185,641	16,457,920

The budget for 1916-17 shows revenue A, 132,914,132 kr.; B, 17,829,415; expenditure A, 118,210,978; B, 18,921,755. The debt stood, March 31, 1915, at 392,636,122 kr.

**NAVY.** The fleet, maintained for the purposes of coast defense, is composed of 3 monitors carrying, each, two 9.4-inch and four 6-inch guns, and 1 carrying one 9.4 and three 4.7; 3 torpedo gunboats; 14 first-class torpedo boats; 6 submarines; besides an old battleship, a cruiser, and some small craft. Building: a coast defense vessel and several submarines.

**GOVERNMENT.** Reigning sovereign, Christian Charles Frederick Albert Alexander William, born Sept. 26, 1870; married April 26, 1898, to Alexandrine, Duchess of Mecklenburg (born Dec. 24, 1879); proclaimed king (Christian X) May 15, 1912, upon the death (May 14th) of his father, King Frederick VIII. Heir-apparent, Prince Christian Frederick Francis Michael (born March 11, 1899). The king is the executive, assisted by a ministry of eight members, appointed by him and responsible to the Parliament, or Rigsdag. This body consists of an upper house of 66 and a lower of 114 members. Justice is administered by judges of the hundreds and by city magistrates, from whose courts appeals are taken to the superior courts at Viborg and Copenhagen. In case of impeachment of ministers the Upper House appoints 4 judges to sit with the Supreme Court as a joint tribunal.

**HISTORY.** Upon the signing of the treaty for the sale of the Danish West Indies by Denmark to the United States for \$25,000,000, the Lower House of the Danish Parliament voted in favor of the sale provided upon reference to popular vote it was approved. This action was taken by a vote of 62-44 and the ratification of the treaty was carried by the same vote. In the Upper House on August 15th a committee of 15 members was appointed to consider the sale. On August 24th a resolution was passed that if the purchase could not be deferred till after the close of the war, the question should be decided at the next election. In consequence of the opposition in the Lower House, however, a resolution was passed on September 26th to refer the matter to popular vote. See UNITED STATES, *Foreign Relations*.

On March 21st, M. Hage succeeded M. Brandes as minister of finance and toward the end of April took charge of the department of commerce. At the same time the ministry of cults was divided into the ministry of churches (M. Pousson) and the ministry of public instruction (M. Nielson). On May 15th the daylight saving measure advancing the legal time sixty minutes was passed. On September 27th in joint committee of both houses it was decided to increase the cabinet by three members without portfolios chosen from the Conservatives, Socialists, and Left parties respectively. The appointments were announced on September 30th

as follows: T. H. Stauning (Socialist), M. Rottboell (Conservative), J. S. Christensen, formerly Prime Minister (Left).

**DENTAL SCHOOLS.** See UNIVERSITIES AND COLLEGES.

**DE PAUW UNIVERSITY.** A co-educational institution at Greencastle, Ind., founded in 1837. It is under the control of the Methodist Episcopal Church. In the fall of 1916 there were 928 students and 38 faculty members. The productive funds of the institution amount to \$1,298,068 and the total income for the last year was \$118,322. The library contains about 48,000 volumes. President, George R. Grose.

**DEVONSHIRE, VICTOR CHRISTIAN WILLIAM CAVENDISH,** ninth Duke of. A British administrator, whose appointment as Governor-General of Canada was announced June 27, 1916. He was born in 1868, son of Lord Edward Cavendish, and succeeded to his uncle's titles in 1908. The Duke of Devonshire was educated at Eton and at Trinity Hall, Cambridge, and from 1891 till he entered the House of Lords represented West Derbyshire in Parliament as a Liberal Unionist. From 1900 to 1903 he served as treasurer of the royal household, under Queen Victoria and Edward VII, and later he became known as one of the closest friends and advisers of George V. In 1903-05 he held the office of financial secretary to the Treasury and after 1915 that of civil lord of the Admiralty. In 1912 he received the G.C.V.O., and he was also made a Privy Councillor. The Duke of Devonshire came into possession of large estates, and of his half dozen houses several are famous—Devonshire House in London, Chatsworth House in Derbyshire, and Bolton Abbey, Yorkshire. His collections of paintings and sculpture are among the most noted in Great Britain. The appointment of the Duke to succeed the Duke of Connaught as Viceroy in Canada was known to be acceptable to the government and people of the Dominion.

**DEWEY, JOHN.** See PHILOSOPHY.

**DIABETES.** According to modern views this disease is due to functional impairment of the pancreas, causing interference with the metabolism of carbohydrates, so that the amount required to supply the necessary physical energy is not assimilated. Glucose then accumulates in the blood, and when the concentration reaches a certain limit, the excess of glucose is carried off through the kidneys. The latest and most successful dietary system for eliminating sugar from the urine, first advised and used by Dr. Guelpa of Paris, was elaborated by Dr. F. M. Allen, and the treatment is known by Allen's name. According to the *Journal of the American Medical Association*, this treatment may be briefly described as follows: The diabetic who constantly indulges in food in excess of his as-

similative capacity invariably becomes progressively worse; hence the conception has arisen that diabetes is characterized by an inherent downward tendency. As a matter of fact, practically every diabetic has some tolerance for food, and the tolerance is usually sufficient to allow for a great enough food intake to cover the basal energy requirements. With proper treatment, it is possible to maintain or even to increase this tolerance. On the basis of animal experiments and carefully controlled clinical observations, Allen has recently proposed a system for the treatment of diabetes that incorporates those features of the older methods that are of proved value, but introduces, in addition, a number of features, some of which are in direct opposition to the older teachings. This treatment is briefly as follows: 1. A preliminary fast is taken until the urine is free from sugar. 2. Following the fast, carbohydrate food is gradually added, at first in the form of green vegetables. 3. Coincident with the addition of carbohydrates, or in place of it, if the carbohydrate tolerance is very low, protein is added to the diet in small but gradually increasing amounts until glycosuria occurs, or a sufficient amount of protein is taken to cover the basal requirement. 4. Fats are added in small amounts during the time of addition of carbohydrates and protein. Subsequently, a sufficient amount of fat is added to make up fuel requirements of the body, provided this amount can be tolerated without the appearance of glycosuria or acidosis. 5. Frequent urine examinations are made, either by the medical attendant or by the patient himself, and the appearance of glucose is taken as an indication for a fast of sufficient length to cause a cessation of the glycosuria. Feeding is subsequently begun with not more than one-half of the carbohydrate contained in the diet at the time of the appearance of glycosuria. Subsequent carbohydrate increase is made very gradually. 6. At intervals the patient fasts for a day or else takes a greatly restricted diet. 7. Body fat is reduced to a minimum and the adult diabetic is not allowed to gain weight; children may gain, but the gain must not be adipose tissue. 8. Active daily exercise carried to the point of healthy fatigue is advocated.

The object of the preliminary fast is to remove from the body the excess of unassimilated carbohydrates and to allow for a rest of the overtaxed pancreatic function. As a result of the fast, a proportionately larger amount of carbohydrate may be metabolized. This has been definitely proved by calorimetric observations on diabetics. With the removal of the unassimilated excess, the organism is better able to assimilate an amount of carbohydrate which it was previously unable to utilize. During the fast, there is a decreased production of acetoacetic and beta-oxybutyric acids. The length of fast required before the urine becomes sugar-free is usually less than five days; exceptionally, it may be as long as eight or ten days. Water is allowed *ad libitum*, and tea or coffee in moderate amount if desired. No sugar or cream is allowed, though saccharin may be used for sweetening. Clear meat broth may be taken after the second day of fasting. Rarely, whisky may be administered, up to one ounce thrice daily, since it does not increase glycosuria, and in certain cases seems to inhibit the production

of the acetone bodies. Alcohol is not an essential in the treatment, and should not be administered to patients in whom it produces such symptoms as burning in the throat, headache, and nausea. During the fasting period weak patients should be in bed. More vigorous ones should exercise as far as practicable, since by exercise the duration of the fast may be shortened.

**Dieulafoy, Madame Jeanne.** A French explorer, archæologist, and author, died at the Château de Langlade (Haute-Garonne), May 25, 1916. Her maiden name Magre, she was born in Toulouse in 1851, was educated in a convent at Auteuil, and at 18 married Marcel Dieulafoy, an engineer. At the time of the Franco-Prussian War, her husband having volunteered, Mme. Dieulafoy obtained permission to accompany him to the front in a soldier's uniform, and she served throughout the war. Afterward, for some years, the two were constantly associated in travel, literary work, and other interests, and in 1881 she went with him on his first Persian exploration. During this period of arduous researches and excavations in the East, much was accomplished, for they discovered the ruins of the palaces of Darius and Artaxerxes, and brought back to Paris notable examples of ancient art, the most famous being the frieze of "Persian Archers," now in the Louvre. Mme. Dieulafoy, accustomed to wearing a man's clothing, was allowed by the French government to continue to do so after her return to Paris. Her fatal illness was acquired in Morocco, whether she had gone with her husband, who had volunteered for defense service at the outbreak of the European war. In Morocco she discovered the ruins of a twelfth century mosque built by Sultan Yakub. Mme. Dieulafoy wrote on her travels; six romances, five historical, of which one, *Parysatis*, was crowned by the French Academy; and an historical study, *Isabelle la Grande*.

**DIGBY, SIR KENELM EDWARD.** A British lawyer and public official, died at Studland, Dorset, April 21, 1916. He was born in 1836 at Tittlehall, Norfolk. At Harrow and at Christ Church, Oxford, he was noted as an athlete, in rowing and cricket. He was called to the bar at Lincoln's Inn in 1865, became a bencher in 1891, and in 1904 was made King's Counselor. At Oxford he was Vinerian law reader from 1868 to 1874, and from 1892 to 1894 was county judge on the Derbyshire Circuit. Then for eight years he held the office of permanent under secretary of state at the Home Office. In 1898 he received the K.C.B. and in 1906 the G.C.B.

**DIMAZON.** A coal-tar product, having the chemical name Diacetyl-amino-azotoluene, and the formula  $\text{CH}_3\text{C}_6\text{H}_4\text{N}:\text{N}:\text{C}_6\text{H}_4(\text{CH}_3)\text{N}(\text{CH}_3)_2$ , which is said to stimulate the proliferation of epithelial cells. It is applied locally in the form of 2 per cent ointment made with petroleum or dissolved in a fatty oil. It may also be mixed with talcum and used as a dusting powder. It is said to be of value in hastening

the healing of indolent ulcers of all kinds, and in the treatment of burns, wounds, and eczema.

**DIPHTHERIA.** Cats have long been suspected as spreaders of diphtheria among children. Confirmation of this suspicion is given by an outbreak of diphtheria in an orphanage, 69 cases coming from one building. After eliminating such factors as water supply, food, and sanitary defects, the cats in the institution were examined. Cultures of secretions of their throats proved to be swarming with the diphtheria bacillus. After the cats were destroyed only a few more cases occurred, owing to previous infection.

The human diphtheria carrier constitutes the most serious problem in relation to the spread of diphtheria with which sanitarians have now to deal, and many devices have been tried to sterilize the throats of these carriers. Many of these measures have been noticed from time to time in the **INTERNATIONAL YEAR BOOKS**. Antitoxin has no effect on the carrier. Toxin and antitoxin mixtures are also valueless. Vaccines have not proved successful in a sufficient number of cases to make their use reliable.

Martin and Wassermann prepared an antibacillary serum; but this and a serum prepared by the Lister Institute have been failures. Attempts to replace the bacillus of diphtheria by nonpathogenic or comparative harmless organisms have been made in several quarters with some success. Among the organisms employed may be noted the *Staphylococcus pyogenes aureus*, the *Bacillus Bulgaricus*, the various lactic acid bacilli, yeasts, and molds. These are applied locally to the tonsils and throat. Direct treatment by chemical substances has long been in vogue. The drugs commonly employed are iodine, alcohol, carbolic acid, chromic acid, and formaldehyde. The latest substance recommended is kaolin, advocated by Rappaport of Chicago, who uses it after it has been thoroughly dried in an incubator. Rappaport claims 21 per cent of successes in 100 cases of diphtheria carriers in 10 days, 50 per cent in 20 days, 90 per cent in 30 days. In young children the powder is blown into the nose by means of a rubber bulb attached to a glass tube. Six treatments at two-hour intervals during the day are advised. In older persons the powder is best applied to the pharynx, by having the patient swallow it, in four half-teaspoonful doses at two-hour intervals, six times during the day. Kaolin acts by adsorption, taking up the bacilli with which it comes in contact. Its action is purely mechanical and not bactericidal.

Ruh, Miller, and Perkins advocate the removal of the tonsils of a diphtheria carrier as the best means at our command of sterilizing the throat. They declare that the reaction after the operation is no greater than in ordinary cases and that the disappearance of the bacillus follows closely the fading of the pseudo-membrane which forms after the operation. Attempts have been made to increase the activity of the white blood corpuscles in diphtheria carriers. For this purpose normal serum suspensions of leukocytes and several drugs such as calcium chlorid, magnesium chlorid, and lactic acid, while successful in promoting phagocytosis in the laboratory, did not seem to stimulate these bodies in the human subject to attack the diphtheria bacilli, these being found outside the leukocytes.

**DISASTERS.** See **FIRE PROTECTION; FLOODS; NAVAL PROGRESS; SAFETY AT SEA.**

**DISCIPLES OF CHRIST.** The total membership of this denomination, variously known as Disciples of Christ, or Churches of Christ, or the Christian Church, and including both the conservative and radical elements, embraced in the year 1916 about 11,182 churches, 1,337,450 members, and 8424 ministers. The strength of this denomination lies largely in the Ohio-Mississippi Valley States. It is one of, if not the leading communion of Christians in the States of Kentucky, Indiana, and Missouri; Illinois, Iowa, Kansas, Nebraska, and Texas are largely represented also. In 1916 the sum of \$2,057,442.41 was raised for missionary work.

Without doubt the most significant feature of the work is known as the Men and Millions Movement. This was an enterprise inaugurated three years ago and has a comprehensive three-fold purpose. First, to secure a fund of \$6,300,000 by individual gifts to equip the mission stations at home and abroad and to substantially increase the endowment of the educational and benevolent institutions. Second, to enlist 1000 choice volunteers for the mission field and to inspire tens of thousands of young people to consecrate their lives to definite Christian service, wherever the Spirit of God shall direct. Third, to establish in every church in the brotherhood the every-member canvass as the best plan for securing from every member of the church an offering upon the first day of the week for the support of the local church and the extension of the Kingdom in all the world.

This proposed fund of \$6,300,000 is to be over and above the regular income of the eight missionary boards and twenty-six colleges. One man in the communion subscribed \$1,000,000 on the condition that \$5,300,000 additional be secured. These gifts are all to be paid within five years. The Disciples now have underwritten \$4,000,000 in pledges and will finish the task on June 1, 1918. This movement is the forerunner and pace-setter for similar movements in other large communions. The president of the general convention is Judge J. N. Haymaker, of Wichita, Kan.; the secretary is Robert Graham Frank, of Liberty, Mo.

**DOCKS AND HARBORS.** With the continuance of the great war comparatively little was heard of European projects for port development, though undoubtedly much new work of a military character such as in Russia was under way. In the United States the large export commerce particularly emphasized the need of better facilities, and improvements were in progress at many of the large ports such as New York, Boston, and Philadelphia along lines previously determined. There were also developments more or less new, some of the more significant of which are given in the accompanying paragraphs.

**NAVAL DRY DOCK AT PHILADELPHIA.** At the end of the year the United States Navy Department was asking for bids for a dry dock at the League Island Navy Yard, Philadelphia, large enough to handle any American vessel built or under construction. The dimensions of this proposed structure were as follows:

Length over all, outside dimensions.....	1064.8 ft.
Length over all, inside dimensions.....	1022.
Width over all, outside dimensions.....	212.5
Width of entrance, mean high water.....	132.6
Depth, mean high water .....	40.

This dock was to be built of concrete, reinforced where necessary and with pile foundations where required. Preliminary estimates of the excavation and material, required were: Excavation 860 cubic yards; concrete, 176,000 cubic yards; piles, 495,000 lin. feet; structural steel, 120 tons; reinforcing steel, 750 tons; cast iron, 200 tons.

**OTHER AMERICAN DRY DOCKS.** Progress continued during the year on the 1000-ft. dry dock at Boston being built by the State of Massachusetts, while the new 1000-ft. dry dock at Balboa in the Canal Zone was completed. The new dock at Balboa is 1000 ft. long and 110 ft. wide, with a depth of 35 ft. over the blocks at mean tide. The rates charged for use of the Balboa dock were 25c. per ton for docking and undocking, and 15c. for each lay day. On the St. Lawrence at Levis, opposite Quebec, the Canadian government had a dry dock of similar length under construction. On the Pacific at San Francisco a government subsidized dry dock was building, over 1000 feet in length, while at Pearl Harbor, Hawaii, the United States navy had under construction a dock of equally large dimensions. Such structures must be considered in any scheme of naval preparedness and with the increase of the United States navy it was thought that an even larger number must be provided.

**PROPOSED BAYONNE, N. J., TERMINAL.** During the year plans were formulated for a new marine and industrial terminal at Bayonne, N. J. This was to be built by a private corporation in cooperation with the city of Bayonne and to resemble the famous Bush terminal in Brooklyn. It was not only to consist of piers but was to contain warehouses and factories, with ample railway entrance and track accommodation. According to the engineers of the project in a description of the first unit: "The installation will provide on upper New York Bay dockage for 30 modern freight ships in addition to lighters, barges, etc., a railroad yard with facilities for classifying and assembling freight with a capacity of 1000 cars, a ferry terminal for a Bayonne-Manhattan vehicular and passenger ferry, four miles of bulkhead platform, 1,350,000 sq. ft. of one-story bulkhead sheds and 7,770,000 cu. ft. of second- and third-story bulkhead sheds, and over 200 acres of land for industrial buildings together with trolley and highway connections, railroad sidings, float bridges for railroad cars, etc.

"The total estimated cost of this installation is \$7,234,545, of which \$2,121,673 is for dredging, bulkheading, and reclamation, and \$5,112,872 for the other facilities. These estimates provide for interest on the cost during construction and provide for 35 ft. depth of water."

**PROPOSED CAMDEN, N. J., TERMINAL PIERS.** The necessity for better and more adequate har-

bor facilities was shown during the years 1915 and 1916, and the State of New Jersey through its Board of Commerce and Navigation was alive to the further utilization of its valuable shore front, particularly in New York harbor and the Delaware River. The chief engineer of the commission, B. F. Creason, in a report on the development of the port of Camden, directly across the Delaware River from Philadelphia, by the construction of two new piers at a cost of approximately \$1,000,000, advised that on one of these there be placed large storage warehouses, so that ships, trucks, and railway cars could be loaded directly from one to another or into the warehouses with a minimum of handling and the greatest possible economy.

The pier proposed in the plans was to be a solid filled structure 328 feet wide, with a timber bulkhead and a platform constructed outshore of the bulkhead to provide deep water wharfage. It would provide dockage for a 600-ft. ship on one side and a 480-ft. ship on the other. It was to be divided longitudinally into two separate operating parts, with a driveway in the middle.

A three-story shed was to be built along the north and south sides of this pier. The lower floor would have a vertical clearance of about 22 ft. for the protection and handling of cargo in transit. The second and third floors, each of which was to be stepped back 5 ft. on the water-side to provide a landing and working platform for cargo, would have a vertical clearance of about 12 ft.

On the lower level there were to be two railroad tracks in a pit immediately adjoining the floor and within the building. The elevation of the pier floor was to be the same as that of the floor of the car, and this would facilitate the handling of freight between the pier deck and the cars. Immediately to the rear of the shed would be a platform 10 ft. wide at the elevation of the car floor, and adjoining this would be a street or roadway 60 ft. in width. The second floor was to have a width of 111 ft. exclusive of the landing platform, and the third floor was to have a width of 106 ft. exclusive of the landing platform. The shed on the northerly side was to have a length of 560 ft. and on the southerly side was to have a length of 480 ft.

This report was submitted on December 16th and was of interest in view of the extensive port developments taking place across the river in Philadelphia.

**MUNICIPAL DOCKS AT ASTORIA.** During the year there were completed for the Port of Astoria, Oregon, two large timber and earth-fill piers as portions of the municipal terminal for ocean-going traffic. These two piers are 1300 feet in length and enclose a slip 400 feet wide at the entrance and 250 feet wide at the rear end. The general type is a pile structure which incloses with a bulkhead 7000 feet in length an earth fill amounting to 43 acres and formed largely from the material dredged from the slips and channels. The slips, of which there are two, have been dredged to a depth of 30 feet, leaving an extra five feet to be removed at some future date. The piers carry a complete system of tracks and driveways and on pier No. 1 there is a freight shed or building 1085 feet in length and 90 feet in width of special construction of timber frame, hollow tile fire walls, and reinforced concrete, with steel sash and steel doors. A complete fire protection system including

sprinklers and outside fire hydrants was installed so that a low rate of insurance was received.

**JACKSONVILLE MUNICIPAL DOCKS.** The new municipal docks at Jacksonville, Fla., which had been under construction for about two years, were completed and opened to use in 1916. They are located about 3.7 miles from the city hall on the St. John River, and enjoy full riparian rights to the 30-ft. channel which was being dredged by the Federal government, to a minimum depth of 26 ft. One mile of water frontage was secured.

As completed there was docking space for 14 freight steamers, with a three-quarters of a square mile 30-ft. depth anchorage in front of the dock. There were two piers, each 1000 ft. in length by 260 ft. in width; one an open pier for handling lumber, rosin, turpentine, tars, and other commodities not injured by the weather; the other with two large steel warehouses 800 ft. long by 73 ft. wide. Both piers were of timber extensions outside of fill, and were paved with vitrified brick set in cement. They were connected by railroad tracks to the municipal belt railroad.

The improvement also included reinforced-concrete warehouses back from the pier but on the railroad, in which were installed two cotton compresses, one of which produced a rectangular bale somewhat smaller than the ordinary cotton bale, and thus saved in shipping rates. The piers and the warehouses were all equipped with fire-fighting appliances and fire pumps.

**ST. LOUIS MUNICIPAL DOCK.** The contract for the first section of the municipal dock to be built at the foot of North Market Street, St. Louis (see *YEAB BOOK* for 1915), was awarded during the year 1916. The revised plans for the structure called for five units, each of 160 feet length with a space of about 22 feet width between, in which would be installed high capacity elevators for lifting large automobile trucks from street level to boats or vice versa, depending upon the range of water, which here amounted to about 42 feet. The work was to be done under the direction of the Department of Public Utilities for the city of St. Louis.

**PIERS IN THE CANAL ZONE.** The new pier No. 7 at Cristobal, Canal Zone, was put to use for unloading cargoes during 1916. It is 1035 x 212 ft. and is carried on 212 concrete filled steel cylinders 6 ft. in diameter and 125 ft. long, with tops at water level. Pier 7 has a railroad track running outside along the walls, for handling freight. The total cost of the pier was \$1,420,000. With its completion there were available at Cristobal 581,150 sq. ft. of floor area in the new concrete dock and pier system at the Atlantic terminal of the canal, of which area 418,180 sq. ft. were inclosed. To provide for a still larger demand, preliminary work was begun and the contract let for the steel cylinders for another concrete pier of the same size as No. 7, to cost about \$1,500,000 and to be completed within two years.

**TIDAL DOCK AT CHEMULPO, KOREA.** The Japanese government in 1916 had under construction a large tidal lock 700 x 1500 feet inside dimensions in the harbor of Chemulpo, Korea, where they were undertaking considerable improvements. As this port is exposed to an extreme range of tides the tidal locks and the gates at the ocean end had to be designed with

special safety devices. The works under construction included an inclosed basin, the Jinsen dock for mooring vessels, and a tidal lock connecting with the outer harbor. A minimum depth of 27.5 feet will be maintained in the lock and if the tide falls below this point the vessels will be locked in and out, whereas at higher stages they can have direct access from harbor to mooring basin. The lock has a clear width of 60 feet and a length of 424 feet between the gates with a depth of 48 feet, which affords a free board of 4 feet above the high water of ordinary spring tides. The walls of the lock are of mass concrete faced with granite at the gate quoins and sills and other important points and the heavy floors, from 10 to 15 inches thick, are reinforced with steel rails. Many of the ideas so successfully used on the Panama Canal were adopted for the construction and operation of valves and gates, which were built in the United States. This tidal lock is described by one of its designers in *Engineering Record*, Dec. 2, 1916.

**NEW HARBOR BASIN AT COPENHAGEN.** For the walls of a new harbor basin under construction at Copenhagen, Denmark, large reinforced concrete caissons built in a special dry dock were floated into position. The port improvement involved the creation of a harbor of 31 ft. depth of water, and the basin is rectangular in shape with three sides 876 feet, 407 feet, and 202 feet in length respectively. The front part of the basin is formed by a row of 22 reinforced concrete caissons, the main types of which are 162 feet in length, 32 feet high, and 16 feet wide, with 14 compartments formed by cross walls extending to the complete height, with three large openings to save weight. The reinforcement consisted of plain round rods and about 700 tons of steel and 13,900 cubic yards of concrete made of the 1:2:3 proportions.

After being built in the dry dock the caissons were moved to near the dock site and then finished and sunk into position on a specially prepared bottom. Each end had a key fitting to the next end key and these key joints are later grouted. The caissons when sunk are filled with sand though filled with concrete behind the face wall and the dock wall proper is made of 1:3:5 concrete with granite face. The new basin and its piers are provided with warehouses and railway tracks, all with the most modern equipment.

**GIRARDOT.** Important port improvements at Girardot, Colombia, in the Magdalena River, were to be started in accordance with a law enacted in 1913, the plans having been approved by the minister of agriculture and commerce. A board of engineers had been appointed to supervise the work. Girardot is of particular importance as a shipping point because it is the only port connected by rail with the city of Bogotá and at the same time connects with the Polima Railway running to Espinal.

**DODD, FRANK HOWARD.** An American publisher, died in New York City, Jan. 10, 1916. A son of Moses Woodruff and Rachel Hoe Dodd, he was born in Bloomfield, N. J., April 12, 1844. His mother came of the family famous for the Hoe printing press. His father, in 1839, had become a partner of John S. Taylor in the publication of religious and theological books, the business being picturesquely and appropriately housed in Brick Church Chapel, City Hall Square, New York. By 1840, Moses W. Dodd had taken over his partner's interest. The son

graduated from Bloomfield Academy; then, in 1859, instead of entering Yale as he had planned, he joined his father.

Succeeding to control of the business in 1870, Mr. Dodd took as a partner Edward S. Mead, who died in 1894. Bleecker Van Wageningen, after 33 years as a member of the firm, retired in 1909. Robert H. Dodd, who has long had charge of the retail and rare book and manuscript departments, joined his brother in 1889; in 1903 a son, Edward H. Dodd, who eventually succeeded his father, and Frederick W. Tufts, were taken in. Steadily, under the direction of Mr. Frank Dodd, the business grew from a small and uncertain beginning to an establishment ranking among the great publishing houses of the country. After several changes in location, a new building was erected in 1910 at Fourth Avenue and 30th Street, the pioneer structure in a district now including many publishing houses. To make it such a centre Mr. Dodd worked tirelessly; for several years he served as president of the Fourth Avenue Association. His activity in all that concerned the interests of American publishers was recognized by his election as president of the American Publishers' Association.

The larger growth of Dodd, Mead and Company, which must be recorded as part of the record of Mr. Dodd's life, may be said to date from their publication of Ian Maclaren's (Dr. John Watson's) *Beside the Bonnie Brier Bush* in 1894. E. P. Roe's *Barriers Burned Away* had been an earlier success. Mr. Dodd became a warm friend of Ian Maclaren, as he did of Robertson Nicoll, Austin Dobson, Beatrice Harraden, Clement Shorter, and other foreign writers of whose books he was American publisher. Maarten Maartens and E. V. Lucas were included in his circle of acquaintance abroad. Although the firm continued to bring out a variety of books, Mr. Dodd himself in his later years gave a large share of his interest to the development of a standard reference work, the *NEW INTERNATIONAL ENCYCLOPEDIA*. As early as 1884 the firm had purchased a reprint of *Chambers' Encyclopædia* called *Alden's Library of Universal Knowledge*, which was revised and enlarged as the *International Encyclopædia*. But he saw the need for a new American work modeled on the lines of the great German enterprises of Brockhaus and Meyer. Accordingly, three years were devoted to the preparation of the *NEW INTERNATIONAL ENCYCLOPEDIA*, and when it was published in 1903 it at once took rank with the best of similar books. Mr. Dodd lived to see it completely revised in a second edition (1913-16). To serve either as supplements to the *ENCYCLOPEDIA* or as separate reference volumes, the *NEW INTERNATIONAL YEAR BOOKS* have been issued annually since 1907. Another enterprise was the founding in 1895 and promotion of *The Bookman*, a monthly magazine of literary news and discussion.

Besides the cares of his immediate business, Mr. Dodd assumed responsibilities in other fields—civic, philanthropic, financial, social. He held the presidency of the Riverside Association for many years, as well as that of the Fourth Avenue Association; was trustee of the New York Kindergarten Association; trustee of the Greenwich Savings Bank; an active member of the Century and City Clubs; and also a member of the National Club in London. His wife, who

survived him only a few months, was Miss Martha Bliss Parker, daughter of the Rev. Joel Parker, first president of Union Theological Seminary.

**DODGE, GRENVILLE MELLE**. An American soldier and railway engineer, died in Council Bluffs, Iowa, Jan. 3, 1916. He was born near Danvers, Mass., in 1831, and although self-supporting from the age of 10, he was able to take the combined military and scientific course at Norwich University (Vermont), where he graduated as a civil engineer in 1850. Soon afterward he went west and became a surveyor for the Illinois Central Railroad and then for the Rock Island, and, after his removal in 1854 to Council Bluffs, where he acquired banking interests, he was employed on the survey for Union Pacific. For a time he was engaged in trading in Colorado and among the Indians of the plains. As colonel of the Fourth Iowa Infantry, Dodge gained a name in the early part of the Civil War by his services at Springfield, Mo., Sugar Creek, and Pea Ridge. In the last named battle three horses were shot under him, a fourth wounded, and he lost a third of his regiment and all his field officers. At that time only 31, he was promoted to brigadier-general. While in command of a division of the Army of the Tennessee, in 1863, his assistance to Grant and later to Sherman was such as to earn him the rank of major-general, with command of the sixteenth army corps. In the same year he took a prominent part in the decisive battle of the Atlanta campaign and became commander of the Army of Missouri, under Sherman. After the close of the war, General Dodge made several campaigns against the Indians, but he resigned in 1866 to take charge of the construction of the Union Pacific Railroad. Within three years the road was completed; Dodge himself had personally surveyed the route and discovered the pass that was used across the Continental Divide. Later he built the Texas Pacific Railroad, an iron bridge over the Missouri between Omaha and Council Bluffs, and railroads in France, Germany, Switzerland, Canada, and Mexico. He was prominent in various patriotic organizations, and in Republican politics, having served a term in Congress (1867-69), and in 1898 he was chairman of the commission appointed by President McKinley to inquire into the management of the war with Spain. Up to 1909 he was chairman of the board of directors of the Colorado and Southern Railway.

**DOMINICA**. A presidency of the Leeward Islands colony (q.v.). Roseau, the capital, had, at the 1911 census, 6577 inhabitants. Coffee, sugar, spices, oils, timber, fruits, etc., are exported. Trade and finance statistics are given in the following table:

	1909-10	1910-11	1913-14	1914-15
Imports .....	£128,779	£147,832	£175,590	£205,778
Exports .....	102,839	112,111	190,701	218,375
Revenue .....	89,521	42,133	48,143	48,896
Expenditure ...	41,860	39,603	47,573	53,486
Shipping* ....	718,227	694,985	572,222	650,144

\* Tonnage entered and cleared.

**DOMINICAN REPUBLIC, THE**. An independent West Indian state, occupying the larger and eastern part of the Island of Haiti. Capital, Santo Domingo.

**AREA, POPULATION, ETC.** The area of the 12

provinces comprising the republic is estimated at 48,577 square kilometers (18,756 square miles). Estimated population, Dec. 31, 1914, 657,270. Most of the inhabitants are Spanish-speaking and form a mixed race of white, negro, and Indian blood. Santo Domingo, founded 1496, and thus the oldest town in the Western Hemisphere, has probably about 26,000 inhabitants; Santiago, 20,000; Puerto Plata and San Pedro de Macoris, 15,000 to 16,000 each; Samaná, Sánchez, La Vega, Agua, Moca, and Monte Cristi, 4000 to 5000 each. Reported births in 1914, 24,319; deaths, 6393; immigration, 3930; emigration, 1587. Primary instruction is free and nominally compulsory. The reported number of schools in 1914 was 518, with 16,124 pupils. The state religion is Roman Catholicism, but the exercise of other religious forms is permitted.

**PRODUCTION, COMMERCE, ETC.** The leading crops commercially are sugar cane and cacao. Other crops are tobacco, coffee, cotton, and bananas and other fruits. The tobacco industry suffered on account of the great war, as Germany was the principal buyer of the crop, but in 1915 and 1916 new and satisfactory markets were found in France. The demand for a substitute for German dyestuffs gave a new impetus to logwood exploitation. Cattle raising has become a well-established and profitable industry. There is a considerable production of honey and wax. Manufacturing has attained little and mining even less importance.

Imports and exports of merchandise have been valued as follows:

	1913	1914	1915
Imports .....	\$9,848,889	\$6,729,007	\$9,118,514
Exports .....	10,047,297	10,588,787	15,209,061

Leading imports in 1915, in thousands of dollars: cotton manufactures, 1913; iron and steel manufactures, 1201; rice, 909; wheat flour, 585; meat and dairy products, 541; oils, 514; leather and manufactures thereof, 297. The increase in export values in 1915 was due more to advance in prices than to increase in quantities. Thus the cacao export in 1914 amounted to 20,745 metric tons, valued at \$3,896,489; in 1915, 20,223 metric tons, valued at \$4,863,754. The sugar export in 1914 amounted to 101,429 metric tons, valued at \$4,943,452; in 1915, 102,801 tons, \$7,671,383. Other exports in 1915: leaf tobacco, \$972,896; coffee, \$458,431; cattle hides, \$185,272; wax, \$113,050. The foreign trade is principally with the United States; imports from and exports to the United States in 1915 were valued at \$7,361,259 and \$12,044,271 respectively. Imports from and exports to Germany declined from about \$1,678,000 and \$2,068,000 respectively in 1913 to \$95,317 and \$5644 in 1915.

The length of railway in operation is reported at 282 kilometers (175 miles); there are, besides, private lines for sugar plantations reported at 362 kilometers (225 miles). Additional railway is projected or under construction. Telegraphs, 16 offices, with 352 miles of line. Santo Domingo and Puerto Plata have foreign cable connection. Radiotelegraphy has been established. There are about 100 post offices.

**FINANCE.** The unit of value is the American dollar. For the fiscal year 1916, estimated revenue and expenditure were \$4,468,000 and \$4,406,567 respectively. Revenue is derived principally from customs duties. These in 1914 were \$3,094,

585 and in 1915, \$3,882,048. The 1915 customs comprised import duties, \$3,555,226; export duties, \$231,951; port dues, \$94,872. Of the total, \$1,197,856 was derived at Santo Domingo, \$862,987 at Puerto Plata, \$731,604 at San Pedro de Macoris, and \$712,803 at Sánchez. The cost of collection was less than 4 per cent. A treaty between the Dominican and American governments authorized a loan of \$20,000,000 for the conversion of the debt, and established an American receivership of customs from April 1, 1905. The sum of only about \$14,000,000 was issued, the remainder being kept against certain disputed liabilities and the provision of a fund for public works. The amount outstanding at the end of 1914 was \$13,042,850. A further loan of \$1,500,000, having no connection with the original loan, was issued in 1913. Both loans are guaranteed by the customs. By agreement between the Dominican Republic and the United States in 1914, an American financial expert was appointed to control the national expenditure and the revenues other than those derived from customs.

**GOVERNMENT.** The executive authority is vested in a president, who, according to the constitution, is elected by indirect vote for six years. He is assisted by a cabinet of seven members. The legislative power is exercised by a congress of two houses, the Senate and the Chamber of Deputies. Senators (12 in number) are elected for six years; deputies (24) for four years. In 1913 José Bordas Valdés became provisional President, assuming office April 14th. After the insurrection of 1914, Bordas Valdés resigned (August 27th), and Ramón Báez was elected provisional President by the Congress. At elections held later in 1914, Juan Isidoro Jiménez was chosen President, and on December 5th was inaugurated for the six-year term. On July 26, 1916, Francisco Henríquez y Carvajal was proclaimed provisional President. See *History* below.

**HISTORY.** The revolutionary movement in the Dominican Republic continued during 1916 and resulted in American intervention. The President, Isidoro Jiménez, who had been elected in 1914 under American supervision, had been involved in constant trouble with his congress and as a result of certain disputes over the budget was impeached at the beginning of May and abdicated on May 7th. In the revolutionary disturbances that followed, American marines were landed, some 2000 in number, in order to insure a free election. Their landing took place at Monte Cristi and Puerto Plata under Admiral Caperton, who issued a proclamation on June 15th saying that the United States would not conquer the country or encroach upon its sovereignty and that the only reason for the presence of marines was to insure the restoration of order and the introduction of necessary reforms. There were engagements between the American and the rebel forces, in July in the course of operations by the former around Santiago, and there was further trouble in October. For details of this see the article on UNITED STATES, section *Foreign Relations*. On July 26th Carvajal was chosen provisional President, as noted above.

**DONALD, JOHN A.** See SHIPPING BOARD.  
**DORSEY, HUGH M.** Elected Democratic Governor of Georgia, Nov. 7, 1916.

**DOUAUMONT.** See WAR OF THE NATIONS.

**DOURINE.** See VETERINARY MEDICINE.

**DOYEN, EUGENE LOUIS.** A French bacteriologist and surgeon, died in Paris, Nov. 21, 1916. He was born in Rheims in 1859. In 1895 he established a private clinic in Paris, where he conducted experiments and devised improvements in surgical technique. At various times he made startling announcements regarding cures for different diseases, but many physicians came to discount his reports, and a number of his conclusions have not been verified by other investigators. Doyen is probably best known for his study of cancer. In 1902 he announced the discovery of a toxin of the disease, but this has not been accepted generally. He also used an electrical method in treatment of cancer, and, besides, in treatment of tuberculosis. He is said to have been the first to use moving pictures of surgical operations. After the outbreak of the European war, he worked on experiments looking to a cure for tetanus, from which affliction the mortality among French soldiers had been great. He was the author of works on cancer, surgical subjects, etc.

**DRAINAGE.** There were no striking developments in the drainage of lands for agricultural purposes during the year 1916. The war in Europe occupied the attention of the countries which have engaged in such work in the past, while in the United States the wave of excitement in land reclamation, by both irrigation and drainage, which was so noticeable a few years ago, had subsided.

**UNITED STATES.** In the United States drainage work has consisted largely in continuing work already under way and in the settlement and improvement of lands already drained. Few State legislatures met in 1916, and hence there was no new drainage legislation. The years 1913 and 1915 witnessed much drainage legislation, and some points in the laws passed have been adjudicated during the year 1916. The general principle followed in financing drainage work is that the cost of drainage shall be assessed upon the lands benefited in proportion to the benefits received, but there has been a tendency to include in drainage districts lands not actually benefited or lands benefited only incidentally. A case involving this point, coming from Louisiana, was decided by the United States Supreme Court (*Nyles Salt Co. v. Drainage District No. 64*, U. S. 239, p. 478), the court overruling the assessment of benefits on lands not actually benefited but which were included in the district for the purpose of deriving revenue for the benefit of other properties. In the irrigated sections of the United States much of the land in need of drainage is brought into that condition by seepage from higher irrigated lands and from irrigation ditches, and several of the Western States have amended their drainage laws by providing that in case lands are injured by "irrigation water from high land . . . such high land shall be considered as being benefited to the extent and in the amount that such lands are responsible for damage to low lands from seepage and saturation from irrigation water." (Laws of Idaho, 1915.) Under this law certain irrigation companies in Idaho were assessed to meet the cost of drainage of low lands lying below their canals, and this action has been upheld by the State Supreme Court. (*In re Drainage District No. 1, Canyon County, Idaho.*) The two decisions referred to are far reaching, and may have

a large effect on future drainage work in the United States.

The organization of drainage districts in the humid sections of the country is largely for the purpose of extending the agricultural areas, and since the demand for new land has not been great, there has been no general activity in this section, although work is in progress in many large districts, particularly in the Mississippi Valley throughout its length and in the valley of the Red River of the North in Minnesota and the Dakotas. Plans for flood protection in Ohio, under the State "Conservancy Act" have progressed, the organization of the Miami district having been approved, and it is expected that work on that district will proceed. Drainage work in the Florida Everglades is progressing, but the lessened demand for land has limited this work somewhat.

In the arid region of the United States, on the other hand, drainage districts are organized almost exclusively for the purpose of protecting or reclaiming lands already farmed, which have been or are being injured by irrigation or by seepage from irrigated lands or irrigation canals. In such sections the demand for drainage comes from the necessity of protecting investments already made and does not depend to any extent upon the demand for land, consequently there has been considerable activity in this field. It is estimated that within the last few years nearly 220,000 acres of irrigated lands have been drained, while very much larger areas are in need of drainage. Estimates of the area needing drainage are of little value because this area is spreading rapidly. In many irrigated valleys the situation is becoming very serious. This is true of the land along the entire course of the Rio Grande in Colorado, New Mexico, and Texas, along the Snake River in Idaho, and in most of the irrigated sections in Wyoming. It has not been found possible to irrigate land in such a way that there will not be surplus water escaping by deep percolation until it raises the ground water and injures either the land on which it is used or other land lying at lower elevations, both by saturation and by an accumulation of alkali. The remedy for both conditions is under drainage. Drains must be placed deep enough to keep the ground water below the root zone of plants and also below the point where capilarity can bring the alkali salts in solution to the ground surface. In many cases where low lands are injured by water coming from higher lands the ground water is flowing under pressure in a porous stratum at a depth at which it is not practicable to lay drains. It has been found possible in such cases to put down wells into the porous stratum which will allow the water to rise to a level from which it is practicable to remove it by drains. The discovery of this possibility has made it feasible to drain many areas which had been considered hopeless. In other cases it has been found possible to intercept the ground water coming from higher levels before it reaches the low lands, thus avoiding the necessity of draining the low lands. The draining of large areas of irrigated lands is making available a considerable supply of water for use in irrigating other lands, and where this is possible drainage is proving a double benefit.

**FOREIGN COUNTRIES.** The European war is occupying the attention of so large a part of the world that little attention is being given to

drainage outside of the United States. In the Nile delta drainage works are being constructed, but the work is being much curtailed by lack of funds due to the war. The same thing is true of drainage in the irrigated sections of India. See FLOODS.

**DRAKE, ALEXANDER WILSON.** An American art editor and wood engraver, died Feb. 4, 1916, in New York. He was born near Westfield, N. J., in 1843 and was early apprenticed to a leading wood engraver, William Howland. In 1865 he became a master engraver and went into business for himself. Five years later, with Richard Watson Gilder and others, he became identified with *Scribner's Monthly Magazine*, which from 1881 was the *Century*. As art director of this magazine and of *St. Nicholas*, until his retirement in 1913, Mr. Drake held a foremost place in the development of illustration in the United States. He did much to gain recognition for Timothy Cole, Jüngling, F. S. King, and other notable wood engravers, and for artists in other fields. For a time he taught drawing at Cooper Institute. Just before his retirement a dinner was given in his honor by more than 400 members of leading literary and artistic clubs, among them the Aldine Club, which Mr. Drake had helped to found. His home contained thousands of art objects, his collections of brass and copper and of rings being especially famous.

**DRAMA, AMERICAN AND ENGLISH.** After two years of commercial depression occasioned by the initiation of the great war, the theatre business, not only in America but also in England, became unusually prosperous in 1916. In England the non-combatant public patronized the theatre in an effort to forget the war, and the same motive led to a crowding of the theatres by the many military men who were sent home, either invalided or on leave, from the trenches in France. In America, the prosperity occasioned by the peculiar situation of this neutral country led to a more than customary willingness on the part of the general public to spend money for theatrical entertainment.

A year when the public was peculiarly predisposed to patronize the theatre ought, in theory, to have been employed judiciously to advance the standards of dramatic art. In fact, however, no notable advance was made, either in England or in America. In England, the leading playwrights were too strenuously occupied with more important labors to devote much attention to writing for the theatre; and the majority of pieces shown in London were entertainments of the lighter sort, many of which were borrowed from America. The only important play that was contributed by any of the acknowledged leaders of the British drama was *A Kiss for Cinderella*, by J. M. Barrie, which was produced in London in the spring, with a cast including Hilda Trevelyan and Gerald Du Maurier, and was reproduced in New York on Christmas night, with a company headed by Maude Adams. In this delightful phantasy, the author took the traditional tale of Cinderella and made it happen inside the head of a little London slavey who dreamed that she herself was the heroine of the story. The piece was written with that exquisite combination of sentiment and humor which is characteristic of Barrie at his best. Of all the new plays of the year, *A Kiss for Cinderella* is the one most likely to endure.

Very few war plays were produced in 1916.

In England the theatre-going public did not wish to be reminded of the war; and in America, also, the managers soon made up their minds that war plays did not pay. One of the worst plays of the year was a melodrama of the war, entitled *Margaret Schiller*, which was written by Hall Caine. The heroine was a German girl who secured employment as a governess in the household of the Prime Minister of England. Her intention was to murder him, but her motives became complicated when she fell in love with him instead. Finally, her impetuous younger brother made his way into the house and, in attempting to shoot the Prime Minister, shot the heroine by accident. Even the popularity of Elsie Ferguson was unable to rescue this ridiculous melodrama from the failure it deserved. Early in the year a bit of pacifist propaganda entitled *The Greatest Nation*, by Marion Crichton and William Elliott, went down to speedy failure; and, in the autumn, a rather pleasing comedy by Grant Stewart and Robert Baker, entitled *Arms and the Girl*, which was set in Belgium at the outbreak of the war, was unable to endure the drastic competition of the first pages of the daily newspapers. This play deserved to succeed, for it told a pretty story of adventure; but the prejudice against war plays was so potent that it was withdrawn after a run of only a few weeks.

In the American theatre, the year must be regarded as a period of wasted opportunity. The theatre business was so brisk that nearly all the managers were making money; and, for the first time in its history, the native American drama was protected from any serious competition from abroad. In theory, the moment was propitious for an earnest effort to develop a serious drama in America by encouraging the production of ambitious plays by native authors. But the commercial managers remained obtuse to this extraordinary opportunity, and contented themselves, for the most part, with producing machine-made imitations of the most successful plays of former seasons.

This obtuseness, however, resulted indirectly in the most significant movement of the season in America. This was a spontaneous movement in support of worthy plays produced by semi-professional societies in little theatres on the side. This impulse became so widespread as to take on the proportions of a general and democratic insurrection against the oligarchical control of all the theatres in America by a narrow circle of commercial managers. In city after city, little theatres were organized and founded, where great plays were produced by people who cared less for money than they cared for art. The success of the Portmanteau Theatre was symptomatic of the general movement. This was a portable playhouse, invented and perfected by Stuart Walker. The proscenium, the stage, the scenery, the lighting-plant could be set up in two hours, either indoors or out of doors; and the whole equipment could be taken down and packed away, in another two hours, for trans-shipment to another place. With this convenient theatre, Mr. Walker produced a repertory of at least a dozen plays of quite extraordinary beauty, including three of the masterpieces of Lord Dunsany—*King Argimenes*, *The Gods of the Mountain*, and *The Golden Doom*. His scenery and lighting were unusually lovely, and the acting of his company was better than the average.

In New York, the Washington Square Players,

after two successful seasons at the Bandbox Theatre, moved over to Broadway, rented the Comedy Theatre for the entire year, and proceeded to continue their success. Their finest achievements of the year were a beautiful production of Maeterlinck's *Aglavaine and Sélysette*, and a programme of four one-act plays which included *Bushido*, a classic masterpiece of tragedy translated from the Japanese. At the Neighborhood Playhouse, in Grand Street, many excellent performances were given by a semi-professional company. The best of these was the first production on any stage of one of the very greatest one-act plays in all dramatic literature—*A Night at an Inn*, by Lord Dunsany. In the autumn, Gertrude Kingstone appeared at this little theatre in a triple bill composed of another new play by Lord Dunsany, entitled *The Queen's Enemies*, and two plays by Bernard Shaw, *Great Catherine* and *The Inca of Perusalem*. The success of this production was so great that it was subsequently transferred up-town to the Maxine Elliott Theatre. Another semi-professional company, called The Provincetown Players, was organized in the autumn, and offered a series of original one-act plays in a little theatre in MacDougal Street.

Several of the finest achievements of the year were accomplished by these little theatres on the side. It was a significant circumstance that, in the month of December, no less than four plays by so non-commercial a dramatist as Lord Dunsany could be seen on a single block of 39th Street in New York. No less symptomatic of the change in public sentiment was the triumphant return of *The Yellow Jacket*, by George C. Hazleton, Jr., and J. Harry Benrimo. This imaginary Chinese play is one of the very finest fabrics of dramatic authorship that America has yet produced. When the piece was first offered in New York, in 1912, it failed commercially. Since then, it has been acted with success in England, Germany, Austria, Hungary, Russia, Spain, and South America. In the autumn of 1916, *The Yellow Jacket* was brought back to New York for a series of special matinees; and the success of this tentative undertaking was so great that it soon became necessary to promote the production to the status of a regular attraction. In the evenings, as in the afternoons, *The Yellow Jacket* continued to make money; and its tardy but triumphant popularity gave the lie at last to the contention that good art cannot pay. Toward the end of the year Klein's *Music Master*, with David Warfield in his familiar rôle was revived with success.

Throughout the year, the finest scenery and lighting were shown in little theatres on the side, where many able artists did great things because of the supreme incentive to labor for the joy of working; but the impulse was carried over into the commercial theatre. The able American artist, Robert E. Jones, was employed by Arthur Hopkins to collaborate in all of his productions, and furnished a series of very lovely settings for *The Devil's Garden*, by Edith Ellis, *The Happy Ending*, by J. and L. du Rocher MacPherson, and *Good Gracious Annabelle*, by Clare Kummer. The Austrian artist, Josef Urban, continued to furnish sumptuous settings for productions so diverse as James K. Hackett's *Macbeth* and *The Merry Wives of Windsor* and Charles B. Dillingham's musical revue entitled *The Century Girl*, which was installed, in the autumn, in that mausoleum of abandoned hopes which used to

house the New Theatre. Excellent scenery was also designed by Mrs. John W. Alexander, for *A Kiss for Cinderella*, and for *His Bridal Night*, a trivial play by Lawrence Rising and Margaret Mayo, in which the pattern of Plautus was applied to the immediate problem of manufacturing a farce for the Dolly Sisters.

Winthrop Ames, after a year of inactivity occasioned by ill health, returned to active management in the autumn of 1916 and made a very beautiful production of *Pierrot the Prodigal*. This celebrated pantomime was first produced in Paris a quarter of a century ago, under the title of *L'Enfant Prodigue*. The scenario was devised by Michel Carré, and the incidental music was composed by André Wormser. The play itself is a classic of the dramaturgic art; and the exquisite production exhibited by Mr. Ames afforded one of the most beautiful adventures of the year. *Pierrot* was presented at the Booth Theatre and later was transferred to the famous Little Theatre. Mr. Ames also produced very charmingly a little comedy called *Hush!*, by Violet Pearn; but the undertaking failed because the subject that was satirized seemed already a little out of date.

Of the serious American plays produced in 1916, the best was *God and Company*, by H. Austin Adams, which was shown for only two performances, by the Stage Society, in New York. This was a very powerful play which attacked sardonically as a humbug the popular conception of religion. The central figure was a preacher who believed he was accomplishing the will of God when he employed his gift of easy eloquence to make the women of his congregation fall in love with him. The leading American playwright, Augustus Thomas, contributed a very skillful melodrama, *Rio Grande*. As a technical accomplishment, this play was exceedingly ingenious; but it failed of popularity because the public did not happen to be interested by its subject-matter—the peculiar psychological reactions in regard to sex that are likely to arise in an environment so preponderantly masculine as an army camp. Eugene Walter brought forth a piece called *Just a Woman*, which, although effectively theatrical, appeared a little crude because of its excessive emphasis. One of the best American plays of the year was *Old Lady 31*, by Rachel Crothers, a charming study of the survival in old age of emotions remembered from the period of youth. This piece was admirably written, with a tactful intermingling of concordant strains of sentiment and humor. Langdon Mitchell made a tasteful but rather unexciting dramatization of Thackeray's *Pendennis*, which was acted by John Drew. For Otis Skinner, a pleasing but rather tenuous comedy, entitled *Mister Antonio*, was written by Booth Tarkington. Another play that, though charming, was a little thin in texture, was *Mr. Lazarus*, by Harriet Ford and Harvey J. O'Higgins, which was acted by Henry E. Dixey. Much more rich in narrative material was *The Man Who Came Back*, an interesting melodrama developed by Jules Eckert Goodman from a story by John Fleming Wilson. *The Co-Respondent*, by Alice Leal Pollock and Rita Weiman, told a journalistic story that was almost worthy of attention. Late in the season, the popular actress, Elsie Ferguson, appeared in an artificial and unworthy play, by Hulbert Footner, entitled *Shirley Kaye*.

Several of the most successful American plays

**THE BALL OF CINDERELLA'S DREAM**  
Cinderella (Maude Adams) and Prince Hard-to-Please (Norman Trevor) lead the dance  
"A KISS FOR CINDERELLA" BY J. M. BARRIE

of the vintage of 1916 must be classed as sentimental instead of serious. One of the best of these was *The Cinderella Man*, by Edward Childs Carpenter, in which the pattern of the famous fairy-story was applied to a new posture of circumstances imagined to exist in New York City at the present time. Very pleasant also was *Come Out of the Kitchen*, a sentimental comedy by A. E. Thomas which was dramatized from a novel of the same name by Alice Duer Miller. In *The Harp of Life*, by J. Hartley Manners, an attempt was made to develop a serious play from the theatric scene which occurs at the close of the third act of *La Dame aux Camélias*. This attempt, artistically, was a failure; but the piece was carried to commercial success by the popularity of Laurette Taylor. Francis Starr appeared, to small advantage, in an artificial comedy of the Georgian era, entitled *Little Lady in Blue*, by Horace Hodges and T. Wigney Percyval, the authors of *Grumpy*. *Polyanna* was a sickly, saccharine, and utterly immoral composition, dramatized by Catherine Chisholm Cushing from a popular novel by Eleanor H. Porter. The heroine of this devastating play was an angel-child who insisted on being glad whenever she was run over by a motor-car. The traditional tale of Cinderella was employed once more—though, this time, ineffectively—in *Rich Man, Poor Man*, a dramatization by George Broadhurst of a novel by Maximilian Foster. *The Melody of Youth*, by Brandon Tynan, exhibited an ingratiating reminiscence of the artificial Irish plays of Dion Boucicault; but *A King of Nouchere*, by J. and L. du Rocher MacPherson, was a very feeble effort to recapture the charm of a foregone romanticism.

The best American melodrama of the year was *The 13th Chair*, by Bayard Veiller, a piece in which the element of mystery was ingeniously sustained until the final moment. *Under Sentence*, by Roi Cooper Megrue and Irvin S. Cobb, was an exciting melodrama which failed only because of an incoherence occasioned by a superabundance of narrative material. *The Silent Witness*, by Otto Hauerbach, and *The Guilty Man*, by Ruth Helen Davis and Charles Klein, both repeated the pattern made popular in former seasons by *Madame X* and *Common Clay*. *The Heart of Wetona*, by George Scarborough, was a fairly interesting melodrama, in which a story intended first to be projected in a New England setting was skillfully transferred by David Belasco to the environment of an Indian reservation in Oklahoma. *The Fear Market*, by Amélie Rives, narrated, with many obvious deficiencies of skill, a scandal which was current in the newspapers not many years ago. *The Intruder*, by Cyril Harcourt, was nothing but a play of Eugène Scribe's brought down to date. *The Flame*, by Richard Walton Tully, was an incoherent composition that made no sense whatever to the average spectator.

The vogue of the "trick-play," which had been current in 1915 and 1914, was considerably reduced in 1916. The only successful "trick-play" of the year was *Cheating Cheaters*, by Max Marcin. In this ingenious and diverting entertainment, the heroine was a detective who pretended to be a crook in order to pretend to be a lady in order to get the better of certain other people who were pretending to be ladies and gentlemen although, in actuality, they were nothing more than crooks. The pattern was extremely

complicated and was designed to mystify the audience; but, despite its obvious defects, the play succeeded because it was conventionally novel. *Coat-Tales*, by Edward Clark, was not successful, although, in this piece, the author employed the novel subterfuge of making his second act happen, not after, but before, his first act in the pattern of imaginary time. In *Any House*, by Owen Davis and Robert H. Davis, a novel device of stage-projection was wasted on a story that was traditional and dull.

No effort need be made to distinguish one from another the lighter American plays produced in 1916. A mere enumeration of their titles will suffice, since all of them exhibited, with more or less success, materials that were traditional. The list includes: *Turn to the Right!*, by Winchell Smith and John E. Hazard; *Nothing But the Truth*, by James Montgomery; *Captain Kidd, Jr.*, by Rida Johnson Young; *Erstwhile Susan*, in which Mrs. Fiske played, by Marian De Forest; *Our Little Wife*, by Avery Hopwood; *Seven Chances*, by Roi Cooper Megrue; *Mile-a-Minute Kendall*, by Owen Davis; *Upstairs and Down*, by Frederic and Fanny Hatton; *Fast and Grow Fat*, by George Broadhurst; and *Object—Matrimony*, by Jules Eckert Goodman and Montague Glass.

Among the European plays imported to America in 1916, the most important was *Justice*, by John Galsworthy, which achieved a very notable success. The piece was presented by John D. Williams, the leading part was acted by John Barrymore, and the stage-direction was entrusted to B. Iden Payne. Another noteworthy importation to America was *The Master*, a serious play by Hermann Bahr, which was exhibited with Arnold Daly in the leading part. Strindberg's *Easter* was presented very adequately by the Stage Society of New York, under the general direction of Madame Strindberg. Bernard Shaw was represented in America, not only by Gertrude Kingston's production of *Great Catherine* and Grace George's revival of *Captain Brassbound's Conversion*, but also by a superlative performance of his inefficient piece, entitled *Getting Married*, which was exhibited by William Faversham. *The Earth*, by James Bernard Fagan, was produced in New York by Grace George. Margaret Anglin revived Oscar Wilde's *A Woman of No Importance*, and subsequently played a thin and ineffective comedy called *Caroline*, by W. Somerset Maugham. *Paganini*, a trifling play, was written for George Arliss by Edward Koblauch—an author of American birth who, in 1916, became a British citizen and changed his name to Knoblock in order to indicate emphatically to the world that he was not a neutral in the war.

Sarah Bernhardt revisited America in 1916, at the age of 71, and showed herself, in spite of her infirmities, to be beyond question the greatest actress in the world. During the course of the year, E. H. Sothern said a formal farewell to the American stage in a series of performances of T. W. Robertson's *David Garrick* and Justin Huntley McCarthy's *If I Were King*.

SHAKESPEARE TERCENTENARY. The tercentenary of the death of Shakespeare was celebrated rather noisily, both in England and in America. The occasion offered an opportunity for unusual endeavors. In New York, James K. Hackett exhibited a very bad production of *Macbeth*, in which the leading parts were played by Viola Allen and himself. Subsequently, Mr. Hackett

presented a fairly satisfactory production of *The Merry Wives of Windsor*. Falstaff was humanly and richly played by Thomas A. Wise, and the merry wives were acted by Henrietta Crosman and Viola Allen. At the same time, Sir Herbert Tree produced in New York both *Henry VIII* and *The Merchant of Venice*. Both plays were very badly acted, and both were produced in the sumptuous style of the Victorian period. Far finer, as a tribute to the tercentenary of the poet's death, was the production of *The Tempest*, in the Elizabethan manner, which was exhibited at the Century Theatre by the Drama Society. The formal celebration of the anniversary was brought to a climax in New York by the production, late in May, in the stadium of the City College, of a masque composed especially for the occasion by Percy MacKaye, entitled *Caliban by the Yellow Sands*. This allegoric composition was not particularly worthy as a contribution to dramatic literature; but the performance, in the windy and rainy air of out-of-doors, was attended by thousands of obedient spectators, and the occasion is one to be remembered in the annals of the civic theatre. **DUNCAN, LOUIS.** An American electrical engineer, died in Pelham Manor, N. Y., Feb. 13, 1916. Born in Washington, D. C., in 1862, and a graduate of the United States Naval Academy at 20, Mr. Duncan was sent by the government to Johns Hopkins for graduate work in physics, and especially in electricity (Ph.D., 1885). While there he determined the unit of electrical resistance. Resigning from the navy in 1887, he taught at Johns Hopkins thereafter till 1898, part of the time as associate professor of applied electricity. From 1902 to 1904 he was head of the department of electrical engineering in the Massachusetts Institute of Technology. Previously, during the Spanish-American War, he had served as major of the First Volunteer Engineers. As consulting engineer to the New York Rapid Transit Commission, Mr. Duncan was identified with the electrification of the transit systems of that city. Besides holding membership in foreign as well as American societies, Mr. Duncan served as president of the American Institute of Electrical Engineers from 1895 to 1897.

**DUNCAN, NORMAN.** An American story writer, died at Fredonia, N. Y., Oct. 18, 1916. He was born at Brantford, Ont., in 1871, and studied at Toronto University, but from 1895 he lived chiefly in the United States, first as a news-

paper man at Auburn, N. Y., then for four years (1897-1901) as a staff writer on the New York *Evening Post* (to which he contributed the stories of the Syrian quarter of New York that first brought him attention; they were collected as *The Soul of the Street*), later as a teacher. Until 1906 he was professor of rhetoric at Washington and Jefferson College, and from 1908 to 1910 adjunct professor of English literature at the University of Kansas. Mr. Duncan also traveled widely, serving as correspondent for *Harper's Magazine* in the Near and Far East. Previously, however, he had spent much time in Newfoundland and Labrador, and it is for stories of these regions, and especially of the sea-coast people, that he is best known. *The Way of the Sea* (1903), a collection, was followed by *Dr. Luke of the Labrador*, and *Dr. Grenfell's Parish*. Other books to be noted include: *The Mother*, *The Adventures of Billy Topsail*, *The Cruise of the Shining Light*, *Every Man for Himself*, *Going Down from Jerusalem*, *The Suitable Child*, *The Best of a Bad Job*, *A God in Israel*, *Australian Byways*, and *Billy Topsail, M. D.* The University of Pittsburgh gave him the degree of Litt.D. in 1912. Norman Duncan's home was at Willoughby, Ohio. At the time of his death he was visiting his brother.

\* Consists of Indragiri in Sumatra and the Riouw and Lingga archipelagoes. † Included in Ternate are a part of eastern Celebes Island, Dutch New Guinea, and a part of the Moluccas; the rest of the Moluccas are in Amboina. Dutch New Guinea extends to 141 E., with estimated area 152,428 square miles and estimated population 262,000.

The population is legally separated into Europeans and those assimilated with Europeans.

"THE GODS OF THE MOUNTAIN"  
Stuart Walker's Portmanteau Theatre, New York  
TWO NOTABLE PRODUCTIONS OF 1916

governed under Dutch laws; and natives, governed under Indian custom and tradition. The native population (exclusive of New Guinea) numbered 37,020,460 (Java and Madoera, 29,715,908); Europeans, 80,910; Chinese, 563,449; Arabs, 29,588; Orientals, other than natives, 22,970. Batavia had 138,551 inhabitants; Semarang, 96,600; Pekalongan, 41,719; Djokjarkarta, 118,378; Padang, 91,440; Palembang, 60,985; Bandjermasin, 16,708; Macassar, 26,145.

**PRODUCTION.** The colony provides a sufficient supply of food for a dense population, besides producing for export sugar, tobacco, tea, coffee, etc. The yield from sugar plantations in 1914 is quoted as 1,363,380 tons; coffee, 38,718 tons; cinchona, 739,532 kg.; tobacco, 5,351,628 kg. (19,933,225 kg. in 1913, and 23,096,387 kg. in 1911). Area (1912) under rice, 3,342,084 bahoes (1 baho = 1¼ acres); production, 85,514,914 piculs; sugar cane, 281,994 (sugar production, 21,562,047 piculs); tobacco, 262,736; indigo, 14,583; other cultures, 3,704,660. Government coffee plantations (Java), 50,526 bahoes (production, 81,000 piculs); production from emphyteutic lands, 272,000; from private estates, 29,000. Tobacco, 30,673,631 kg. in Java, and 19,965,896 in Sumatra. Tea (Java), 29,893,603 kg. in 1914; cacao, 1,186,282 kg. Tin from the mines at Banka, Billiton, and Riouw (1914-15), 20,526 tons. Coal production (1914), 609,888 tons. Petroleum, 1,564,927,000 kg.

**COMMERCE.** There is an import tax of 6 per cent on certain goods, and on a few articles, such as tobacco, a small export duty. Government and private trade, merchandise, and specie, are given for three years (in florins) below:

	1912	1913	1914
<b>Imports</b>			
Government:			
Merchandise . . . . .	20,229,755	27,021,000	28,485,297
Specie . . . . .	5,170,000	4,419,000	3,320,000
Private:			
Merchandise . . . . .	380,669,597	437,903,000	384,894,423
Specie . . . . .	29,553,007	28,998,000	13,459,091
<b>Total</b> . . . . .	<b>435,622,359</b>	<b>493,341,000</b>	<b>430,158,811</b>
<b>Exports</b>			
Government:			
Merchandise . . . . .	51,411,500	51,231,000	38,435,735
Specie . . . . .	609,072		
Private:			
Merchandise . . . . .	533,617,014	620,504,000	640,580,083
Specie . . . . .	1,410,614	6,211,000	5,539,171
<b>Total</b> . . . . .	<b>587,048,200</b>	<b>633,946,000</b>	<b>684,584,989</b>

Excepting rice, about half of which goes to Borneo and China, the majority of the exports go to the Netherlands. Steamers entered at the ports in the 1914 trade, 6147, of 4,604,546 tons, and 3531 sailing vessels, of 223,070.

Railways in operation (1914), 1727 miles; government telegraph and cable lines, 12,319 miles.

**FINANCE, ETC.** The 1916 budget estimated the revenue at 323,763,348 florins and the expenditure at 367,318,225 florins. The local revenue is derived from land, taxes on houses and estates, licenses, customs, etc., from government monopolies (salt, pawn shops, opium, railways), and sales of government products. The East Indies have been governed directly by the Netherlands since the dissolution in 1798 of the Dutch East India Company.

The Minister for the Colonies introduced in the Dutch Parliament on Sept. 1, 1916, a bill authorizing compulsory military service in the Dutch East Indies for both Europeans and natives.

**DUTCH GUIANA, or SURINAM.** A colony of the Netherlands (between 46,000 and 49,000 square miles) on the northern coast of South America. Population, Jan. 1, 1915 (exclusive of negroes in interior forests), 85,536. Sugar, molasses, rum, cacao, coffee, corn, rice, and gold are the principal exports. Total imports (1914), 6,309,849 florins; exports, 9,201,669 florins. Revenue and expenditure for 1916, 7,556,765 and 6,633,064 florins respectively; subvention, 923,701.

**DUTCH REFORMED CHURCH.** See REFORMED CHURCH IN AMERICA.

**DUTCH WEST INDIES.** See CURAÇAO.

**DWIGHT, TIMOTHY.** An American educator, died at New Haven, Conn., May 26, 1916. Of a famous old New England family, grandson and namesake of the eighth president of Yale College, Dr. Dwight was born at Norwich, Conn., in 1828 and graduated in 1849 from Yale. There he remained for several years, taking the degree of M.A. and studying at Yale Divinity School. To the latter institution he returned in 1858, after two years at the universities of Bonn and Berlin, to be until 1861 assistant professor, and thereafter till 1886 professor, of sacred literature and New Testament Greek. From 1886 till his retirement in 1899 he served as president of Yale, which became a university seven months after he took office, and which under his administration saw a remarkable development, gaining more in endowment, buildings, variety of courses, and enrollment than in any earlier period. Dr. Dwight was greatly beloved by Yale men. He had been ordained a Congregational minister in 1861, and most of his literary work was of religious character. Besides serving as a member of the American Committee for the revision of the English version of the Bible, he was an editor of the *New Englander* (later the *Yale Review*) and published various commentaries and a volume of sermons, *Thoughts of and for the Inner Life* (1899). He also wrote *Memories of Yale Life and Men* (1903).

**DYESTUFFS.** See CHEMISTRY, INDUSTRIAL.

**DYNAMO-ELECTRIC MACHINERY.** As was noted in the 1915 YEAR BOOK, the construction of still larger sizes of turbo-generators over those of the preceding year was a feature of 1916. Generators of 25,000 and 30,000 kilowatts capacity became rather commonplace, owing to the large number of them constructed, and machines of from 50,000 to 75,000 kilowatts were in contemplation. The largest generator built during the year was a 45,000-kilowatt machine, to furnish alternating current at 12,000 volts when running at 1200 revolutions per minute.

One of the most important developments of the year was the adoption of electric propulsion for many war vessels authorized for the United States navy. As mentioned in the 1915 YEAR BOOK, this system was decided upon after much investigation and observation of various types of generators and motors. Its advantages for naval purposes are reliability, ease of control, and saving of space.

The experience with "regenerative" control of electric motors obtained in actual service (see ELECTRIC RAILWAYS) brought out a number of

features of this system of great value to electrical engineers and railroad men, and marked a distinct advance in the art and practice of train operation.

**EAKINS, THOMAS.** An American artist, known both as a painter and as a sculptor, died on June 25, 1916. He was born in Philadelphia in 1844, and studied first at the Pennsylvania Academy. Afterward he was a pupil of Gérôme at the Beaux-Arts, Paris, and studied sculpture with Dumont. Eakins was long professor of painting in the Pennsylvania Academy, and he lectured also on anatomy in art schools. In 1902 he was elected a National Academician. He received awards at the Chicago, Paris, Buffalo, and St. Louis expositions; the Temple gold medal of the Pennsylvania Academy and the Proctor prize of the National Academy. Although he painted many figure studies, such as "Chess Players" (Metropolitan Museum) and "Cello Player," he is best known for his portraits, chief among which is "The Clinic of Professor Gross," owned by Jefferson Medical College, Philadelphia. He also painted Dr. Agnew in his clinic, and Cardinal Martinelli. Among his works of sculpture are two reliefs on the Trenton battle monument and horses on the Brooklyn soldiers' and sailors' monument.

**EARTH, ORIGIN OF THE.** See GEOLOGY.

**EARTH DAM.** See DAMS.

**EARTHQUAKES.** The record for 1916 included no individual disturbances noteworthy for the incidental damage done to life or property, comparable to the disastrous shocks that took place in the few preceding years. It was not, however, a period of seismic repose; the heavier shocks did not happen to be centred in populous areas and so accomplished no great amount of destruction. An example of the sort was the Alaskan earthquake which was transmitted all over the globe and belonged to the first order of magnitude, yet so far as known caused no loss of life. A rather heavy shock was felt in Northern Italy on August 16th, particularly in Rimini, Pesaro, and Ancona, where it destroyed a few buildings. Its epicentral area was farther north than that of the disastrous disturbance of Jan. 13, 1915. The instrumental study of earthquakes was continued with the usual vigor, adding many data to the store already accumulated, which in the course of time will serve as a basis for the development of more exact knowledge of the origin and transmission of seismic phenomena. It has been possible already to locate the principal zones of disturbance and to obtain a measure of the frequency of shocks that originate within them. The relation of earthquake occurrence to external influences is also a field of investigation which promises to yield important results for the future.

**EAST AFRICA PROTECTORATE.** A British dependency, lying between the Umba and Juba rivers and extending from German East Africa to Italian Somaliland and Abyssinia and inland to Uganda. Estimated area, about 200,000 square miles, inclusive of coast territory leased from the Sultan of Zanzibar. The population is estimated at about 4,000,000, including about 25,000 Asiatics and 3500 Europeans. Mombasa, the largest town and chief port, has a population of about 30,000 (250 Europeans). Nairobi (14,000 inhabitants, of whom about 800 are Europeans, and over 3000 Indians) is the administrative headquarters and the central station

of the Uganda Railway. Cattle, sheep, and ostriches are raised. The crops include grains, coconuts, cotton, sisal, rubber, tobacco, coffee, and fruits. The worked mines yield carbonate of soda, limestone, graphite, and gold. The telegraph system, exclusive of the lines in Uganda, has 2302 miles of line (the railway line has three wires). Commercial and financial figures follow:

	1909-10	1910-11	1913-14	1914-15
Imports ...	2775,246	21,000,846	22,147,937	21,469,210
Exports ...	590,057	962,911	1,482,876	1,004,756
Revenue ...	503,039	609,585	1,123,789	984,756
Expenditure ...	669,404	682,041	1,115,899	1,151,730
Gr't-in-aid ...	133,500	150,000	.....	.....
Shipping* ...	1,914,153	1,864,740	1,791,081	.....

\* Tonnage entered at Mombasa and Kilindini.

The import figures are exclusive of railway material, government stores, and specie. The Uganda (Mombasa-Victoria) Railway is worked as a state line of the East African Protectorate. Its length is 618 miles, with a gauge of one meter.

**EBNER-ESCHENBACH, MARIE, BARONESS VON.** An Austrian author, whose death in Vienna was announced March 14, 1916. She was born in 1830 at Castle Zdislawitz, Moravia, as Countess Dubsky. Baron Ebner-Eschenbach, to whom she was married in 1848, was an Austrian officer. Her writings, especially her novels, are notable in content and style. She is less well known for plays, a collection of aphorisms, and verse. Between 1893 and 1911 her works were published in a collected edition. Several were translated into English. Among more than a score of titles, are: *Erzählungen* (1875); *Ein kleiner Roman* (1889); *Glaubenslos* (1893); *Agave* (1903); *Genrebilder* (1910).

**ECHEGARAY, JOSÉ** (full name ECHEGARAY Y EIZAGUIRRE). A famous Spanish dramatist, also a mathematician and statesman, died Sept. 14, 1916, at Madrid. In the same city he was born April 19, 1832. Graduating at the head of his class of engineers in the Escuela da Caminos, Canales, y Puertos, Madrid, at the age of 20, he was appointed engineer of the second class the next year and was sent to Almería (Granada). He devoted himself to mathematics and by 1854 had become professor of that subject at the Escuela da Caminos, serving also for a few years as secretary of the institution. A book that he wrote on problems of analytical geometry brought him election to the Royal Academy of Sciences when he was only 32. He took his seat the next year (March 11, 1866), on the fiftieth anniversary of which occasion (1916) the King presented to him a special medal of the Academy. In 1869 he was appointed Deputy to the Constituent Cortes, and sat for the Asturian district. His conspicuous talents for public life were recognized from the first. In the very year of his entering the Cortes he was appointed Minister of Public Works, an office that he held till 1871 and again in 1872. In 1872-73 and in 1874 he served as Minister of Finance and after another term (1904-06) at this post became Life Senator and president of the Council of Public Instruction.

His first plays, *El libro talonario* and *La esposa del vengador*, were both published in 1874. They marked the beginning of a remarkable literary career, during which the dramatist pro-

duced some 70 plays, in prose or verse. Eche-garay came to be recognized as the leader and chief pride of a new movement in Spanish drama, an epoch rather than a movement. His greatest work is *El gran Galeoto* (1881), a powerful presentment of the evil done by slander. It has been translated (several times) into English as *The Great Galeoto*, and was produced on the American stage by Mr. and Mrs. William Faversham under the title *The World and His Wife*. Others of his plays to be had in English are: *The Son of Don Juan* (1895), *The Madman Divine* (*Poet Lore*, 1908), *Madman or Saint* (*Poet Lore*, 1912), *Mariana* (1914), and *Always Ridiculous* (1916). With Mistral, Eche-garay shared the Nobel prize in literature for 1904. Consult L. Antón del Olmet and A. García Carraffa, *Echegaray* (Madrid, 1912).

**ECHEGARAY, MIGUEL.** See SPANISH LITERATURE.

**ECLIPSE.** See ASTRONOMY.

**ECONOMIC ASSOCIATION, AMERICAN.** At the same time as the meetings of the American Sociological Society, the American Statistical Association, and the American Association for Labor Legislation, the American Economic Association held its 29th annual meeting at Columbus, Ohio, Dec. 27-30, 1916. The four associations met jointly for one session and later in various combinations. Papers were read by distinguished economists, including Richard T. Ely, Henry C. Taylor, Paul L. Vogt, Allyn A. Young, O. M. W. Sprague, J. E. LeRossignol, and others. An especially important feature was a discussion of economic problems likely to arise in the United States at the close of the European war. Topics for consideration included the gold supplies, immigration, the attitude of governments toward industry, and the redistribution of labor. The association has about twenty-five hundred members, many of whom are not professional economists, but are persons interested in economic questions. President, Thomas N. Carver; secretary, Allyn A. Young.

**ECONOMICS, SOCIAL.** See SOCIAL ECONOMICS.

**ECUADOR.** A South American republic lying between Colombia on the north and Peru on the south, and on the west bordering the Pacific. The capital is Quito.

**AREA AND POPULATION.** Pending the final establishment of boundaries hitherto in dispute, the area of Ecuador may be stated at 299,600 square kilometers (115,676 square miles); or, including the Galápagos (about 730 miles off the coast), 307,243 square kilometers (118,627 square miles). The population was estimated in 1910 at 1,500,000. The proportion of pure white inhabitants is very small; mestizos number perhaps 400,000, while the great majority of the people are Indian. Guayaquil, by far the most important seaport, is supposed to have over 80,000 inhabitants; Quito, about 75,000; Cuenca, over 40,000; Ríobamba, 20,000; Ambato, Loja, and Latacunga, about 12,000 each; Bahía de Caraquez, Ibarra, and Puertoviejo, about 10,000 each; Esmeraldas, 5,000.

**EDUCATION.** Primary instruction is free and nominally compulsory, but illiteracy is prevalent. According to a report of the minister of public instruction, there were in 1916 1114 government elementary schools, 151 municipal schools, and 135 private schools; the total enrollment in these schools was 97,395. For secondary education

there are 35 schools, besides 9 government higher schools and commercial and technical schools at Quito and Guayaquil. The Central University at Quito has faculties of science, jurisprudence, medicine, and pharmacy; the Azuay University at Cuenca and the Guayas University at Guayaquil have faculties of jurisprudence, medicine, and pharmacy. There is a college of jurisprudence at Loja. The state religion is Roman Catholicism. Civil marriage was made obligatory by a law of 1902.

**PRODUCTION AND COMMERCE.** Agriculture is the country's chief source of wealth. Valuable minerals exist, but have not been largely exploited. Ecuadorian manufactures are of little commercial importance, except Panama hats, which are produced in large numbers. The most important crop is cacao, for which Ecuador supplies a large part of the world's demand, though the proportion is smaller than formerly; the average output of the country has not declined, but the production in other tropical regions, as Eastern Brazil, the Dominican Republic, and São Thomé, has in recent years increased. The Ecuadorian cacao is grown in the coastal regions; the 1914 production was reported at about 92,214,000 pounds. Other products of some importance are coffee, ivory, nuts, rubber, sugar cane, and tobacco. The rubber industry has suffered from the thriftless exploitation of the trees.

For the 1915 foreign trade only approximate figures are available; the imports have been reported at 26,000,000 sucres and the exports at 34,000,000 sucres. In 1914, imports and exports were valued at 17,289,644 and 26,875,650 sucres respectively, as compared with 18,182,488 and 32,488,410 sucres in 1913. Import and export values (with the sucre at 48.6 cents) are shown below in thousands of dollars:

	1910	1911	1912	1913	1914
Imports . . . .	8,008	11,489	10,855	8,887	8,408
Exports . . . .	13,688	12,692	18,690	15,789	18,062

The principal imports are cotton and woolen fabrics, foodstuffs, hardware, machinery, wines and liquors, ready-made clothing, etc. By far the most important export is cacao; this amounted in 1913 to 41,869 metric tons, valued at 20,524,340 sucres; in 1914, 47,210 tons, 20,769,322 sucres; in 1915, 37,019 tons, 19,938,092 sucres. Normally France takes about one-half and the United States about one-fourth of the cacao export. The export of Panama hats in 1914 was valued at 2,000,000 sucres. The coffee export amounted to 3686 metric tons in 1913 and to 2980 metric tons, valued at 1,212,000 sucres, in 1914; ivory nuts, 31,684 tons in 1913 and 8583 tons, valued at 944,000 sucres in 1914. Export of gold in 1914, 752,000 sucres; hides, 480,158; rubber, 185,457. Trade by principal countries, in thousands of dollars:

	Imports		Exports	
	1913	1914	1913	1914
United States . . . . .	2,818	2,771	3,884	3,588
United Kingdom . . . . .	2,618	2,415	1,620	1,281
Germany . . . . .	1,568	1,204	2,627	860
Italy . . . . .	296	389	336	288
Spain . . . . .	286	365	670	628
France . . . . .	485	327	5,882	4,488
Netherlands . . . . .	0	60	256	1,018
Total, including others.	8,887	8,408	15,789	18,062

**COMMUNICATIONS.** Communication and transportation facilities are very inadequate. For the most part the roads are simply bridle paths. There are in operation about 400 miles (about 650 kilometers) of railway; of this, 297 miles are comprised in the line from Durán (opposite Guayaquil) to Quito. This line, opened in June, 1908, has failed to earn interest on its bonds and has been operated at a heavy loss.

During 1916 the Congress authorized the construction of a railroad from Chone to Quito, passing through Santo Domingo de los Colorados. This road was to connect Quito with the ports of Manta and Bahía de Caraquez on the central western coast of Ecuador, and a part of the customs duties collected at these ports will be used for the construction of the road, in addition to other funds including the proceeds of loans raised both abroad and at home. Other legislation provided for a new railway from San Lorenzo del Pailon, or some other accessible port in the Province of Esmeraldas, to Ibarra. This project, however, was not to affect the construction of the line from Quito to Ibarra, which would connect at Ibarra with the railway from the port. An appropriation was also made for a branch road from Ibarra to Tulcan on the completion of the road from Quito to Esmeraldas.

The aggregate length of telegraph lines is reported at about 3500 miles. Radiotelegraph has been installed. Post offices, 168.

**FINANCE.** The standard of value is gold. The monetary unit is the sucre; its par value is 48.665 cents, being one-tenth of a pound sterling. Revenue and expenditure in 1914 are reported at 16,913,787 and 20,220,794 sucres respectively. The revenue consisted of import duties 7,707,191 sucres, export duties 3,806,981, and taxes 5,399,615. The revenue for 1916 was estimated at 15,536,327 sucres. The public debt was stated in 1916 at 43,142,392 sucres, of which about 32,000,000 sucres comprised the foreign debt.

**GOVERNMENT.** The executive authority is vested in a president, elected by direct vote for four years; he is ineligible for reelection until after a lapse of two terms. He is assisted by a cabinet of five members. The legislative power is exercised by a congress of two houses, the Senate and the Chamber of Deputies. Senators (32 in number) are elected for four years and deputies (48) for two years, all by direct vote. The franchise is held by male citizens over 21 years of age and able to read and write. For the term beginning Aug. 31, 1911, Emilio Estrada was inaugurated president in succession to Gen. Eloy Alfaro. The death of Estrada, Dec. 21, 1911, was followed by an insurrection headed apparently by friends of Alfaro (who was killed). On March 31, 1912, Gen. Leonidas Plaza Gutiérrez, commander of the government forces, was elected President, and on the 31st of August following was inaugurated for a four-year term. General Plaza had been President in 1901-05. He was succeeded in 1916, for the term 1916-20, by Alfredo Baquerizo Moreno, who was elected January 12th and had been minister for foreign affairs and president of the Senate. The election was accompanied by serious disorders. One of the first acts of the new government was the promulgation of an eight-hour-day law, with 25 per cent extra pay for overtime work, 15 days' annual vacation, and 60 days' sick leave with pay.

**EDUCATIONAL BUILDINGS.** See ARCHITECTURE.

**EDUCATION IN THE UNITED STATES.**

**STATISTICS.** *Attendance in Elementary and Secondary Schools.* Owing to the fact that it has been impossible for the United States Bureau of Education to collect and to compile the statistics in time to submit them to the printer on the date set by Congress, complete information concerning the statistics for the year 1914 cannot be presented. A brief summary issued by the Bureau of Education contains the following estimates. It is estimated that 23,500,000 attended schools of some kind in the United States in 1916. This is approximately 24 per cent of the population, as compared with 19 per cent in Great Britain, 17 per cent in France, 20 per cent in Germany, a little over 4 per cent in Russia. The number of pupils in public kindergartens and elementary schools in 1914 was 17,500,000, an increase of more than a million in four years. The number of high school students was 1,219,000. There were 706,000 teachers. Of this number 169,000 were men. The report shows that the number of men teachers has increased somewhat since 1900, while the number of women teachers is almost doubled. In 1900 positions in public high schools were evenly divided between men and women. At present the women outnumber the men by 8000. The average annual salary of all teachers is \$525. The figures are highest in the East and North Atlantic States, with \$699 and \$696 respectively, and lowest in the South Atlantic States with \$329. The average salaries vary from \$234 in Mississippi to \$941 in New York.

*Cost of Education.* The estimated cost of education in 1914 was about \$800,000,000. It is estimated that the cost for 1916 was no less than \$1,000,000,000. In 1915 public elementary schools cost approximately \$500,000,000, public high schools \$70,000,000, private elementary schools \$52,000,000, private secondary schools \$15,000,000. For the year 1914 \$555,077,146 was reported as spent for public schools. New York, with an expenditure of \$66,000,000, ranks first in the total amount expended. On a per capita basis Utah ranks highest, with an expenditure for education of \$10.07.

**THE GARY PLAN.** The system of school administration developed by Supt. William A. Wirt at Gary, Ind., has received a great amount of attention during the past year. During 1915 Superintendent Wirt was employed as a consulting expert by the New York City Board of Estimate. He was required to devote one week each month to this work and he received \$10,000. He was retained during the year 1916 on the same terms. New York City organized several of its schools in accordance with Mr. Wirt's plan. This brought about a lively discussion as to the value of the scheme. Some of the superintendents and principals have bitterly opposed the extension of this form of organization. The Public Education Association of New York City has urged that the plan be given a fair trial. It has seemed so important that the General Education

Board has undertaken a thorough investigation of the schools at Gary, and for this purpose some of the most competent men in the country have been employed. Briefly stated, Mr. Wirt proposes to use the entire school equipment all the time. He accomplishes this through what may be called the "two-school plan." The activities of the school are divided into four departments. One department deals with the work ordinarily conducted in the classrooms, another with such activities as are conducted in shops, laboratories, and studios, another with mass instruction conducted in the auditorium, and another with such activities as may be conducted in gymnasiums, playgrounds, and playrooms.

**THE HENRY CLAY FRICK EDUCATIONAL COMMISSION OF THE CITY OF PITTSBURGH.** During the summer of 1916 announcement was made that Mr. Henry Clay Frick had added \$250,000 to his original gift of the same amount for the purpose of assisting the teachers of Pittsburgh in conducting professional work. Several thousand teachers of that city have already availed themselves of the opportunities offered by the first gift. Dr. John A. Brashear has been the custodian of the fund, but the name of the donor was secret until Mr. Frick was persuaded to allow his name to be made public.

**EDUCATIONAL INVESTIGATIONS AND SURVEYS. Buffalo, N. Y.** Upon the request of the Superintendent of Public Instruction for Buffalo, the New York State Department of Education made a careful examination of the whole educational system in Buffalo. Dr. Thomas E. Finnegan, Assistant Commissioner for Elementary Education, took charge of the work and employed members of the official staff of the department as his assistants. Each of ten men spent about fourteen weeks in examining the schools. The report issued by the Education Department of the State of New York consists of seven chapters and an appendix. It calls attention first to the system of organization in operation before 1916. For many years the city had no board of education. The common council had the general power to control and regulate the school system of the city. The superintendent of schools was elected by popular vote. The new Buffalo charter, which went into operation on Jan. 1, 1916, provided for a board of education, but the report criticises the provisions of this charter in that the council is still authorized to determine the period and the conditions of appointment of teachers and the salaries to be paid, to determine the courses of study, to appoint members of the board of education and the superintendent of education, and to remove members of the board, the superintendent, or other officers employed in the administration of the school. The report criticises somewhat severely the quality of instruction and the character of supervision. It discusses in detail the teaching of the various subjects in the elementary and high schools and offers many constructive suggestions.

**Los Angeles, Cal.** The Los Angeles Board of Education appointed a commission consisting of Albert Shields of New York City, F. J. Robbitt of the University of Chicago, and W. A. Jessupp of the University of Iowa, to report on the future policy of the schools. This report was submitted during the summer months and Mr. Shields was appointed superintendent of schools.

**Maryland.** The Legislature of Maryland passed an act in 1914 containing the following statement:

"It is the desire of the General Assembly that there be made a comprehensive study of the public school system of the State of Maryland, and of the State-aided elementary and secondary schools and the higher educational institutions of the State of Maryland, with a view to correlating and coördinating the different institutions wholly or partially supported by State appropriations."

The Legislature appropriated \$5000 to carry out the act. The commission appointed by the Governor requested the General Education Board to undertake the survey. The report of the commission was submitted to the Governor on Dec. 20, 1915, and many of the recommendations were incorporated in the new school laws passed by the Legislature of 1916. The report says: "Public Education in Maryland is on the whole soundly organized. Further, the State deals generally with the public schools in the matter of money. We do not propose, therefore, any fundamental change in the general structure of the public school system of Maryland nor do we suggest that the State increase at all its appropriation to the schools." The report criticizes the county superintendency, in that the superintendent was not required to be trained or to be an experienced schoolman. The commission found that the State's general school fund was distributed almost unconditionally. The counties got their quota whether they did their educational duty or not. It states that "public education in Maryland is in politics." The teaching force was not thoroughly trained. Among other things, it recommends a revision of the law dealing with the certification of high school teachers and the enactment of a State-wide compulsory education law. It also recommends that "the State contribution should in future be paid to no county which does not levy for educational purposes a minimum tax fixed by the Legislature. The more progressive counties will, of course, continue to levy more, as they do now."

**St. Louis, Mo.** St. Louis, in common with most other large cities, has reached a point where it is difficult to secure sufficient funds for the support of the various departments. As regards the schools the city authorities believed that it was necessary either to reduce the cost of instruction or to issue bonds for the construction of new buildings. The latter alternative was the one agreed upon by the board. Before it was finally decided, however, it was determined to make a survey of the school system in order to assure the citizens that there was a need of funds. The survey, therefore, did not originate in any dissatisfaction with the school but was undertaken for the definite purpose of assisting in securing a bond issue. The school board appropriated \$10,000 for a survey and Prof. Charles Hubbard Judd, Director of the School of Education at the University of Chicago, was given charge. Dr. Judd associated with himself a staff of specialists and every phase of education in the city was examined and as far as possible tested.

**San Francisco, Cal.** The United States Commissioner of Education accepted an invitation to survey the schools of San Francisco. In addition to specialists from the Bureau of Edu-

cation, Commissioner Claxton employed Prof. John W. Withers of St. Louis, Prof. Charles McMurry of Peabody College for Teachers, Prof. J. Stanley Brown of Joliet, and Prof. F. B. Dressler of Peabody College for Teachers.

**MILITARY TRAINING IN SCHOOLS.** The Legislatures of several States considered the advisability of introducing military training in the public schools. The most important legislation on this subject occurred in New York. The Welsh-Slater law created a State Military Training Commission consisting of three members. The Major-General of the National Guard of the State is the chairman of the commission. The Board of Regents was given authority to appoint a member and the Governor appointed the third member. This commission, consisting of John F. O'Ryan, Major General, Dr. John H. Finley, Commissioner of Education, and George J. Fisher, M.D., Secretary of Physical Department, International Committee of Y. M. C. A., has recommended to the Board of Regents of the State of New York a programme of physical training for elementary and secondary schools. Commissioner Finley has issued the following statement regarding the work to be accomplished:

"In accordance with the law with the beginning of the school year this fall every elementary school in the State, public and private, must provide for every pupil over eight years of age a physical training course to consist of setting-up exercises and gymnastic drills or supervised recreation. This programme makes compulsory for the present year the minimum time prescribed by the act, twenty minutes a day or one hundred minutes a week for every school child.

"The setting-up exercises consist of drill of at least two minutes' duration at the beginning of each class hour, or a minimum of four times in each school day. Boys are to be grouped on one side of the room and girls on the other. Capable pupils will be selected as leaders. Variations are to be introduced at intervals and emphasis is to be laid on posture, through postural exercises; discipline, through orderly response to commands; and health, through exercise of large muscle groups, breathing exercises, and the habit of exercise. The syllabus for this work is being prepared by the board of regents, and will be in the hands of the superintendents and principals by October 1st.

"If there are facilities in the school, gymnastic drill is to be given sixty minutes a week, preferably in two periods of thirty minutes each, under a special teacher of physical training. The regulations point out that this is to be sixty minutes of actual work on the floor, not to include time spent in preparation for exercises or for return to a following recitation.

"In schools where gymnastic drills cannot be given, supervised recreation for a like time, sixty minutes a week, is to be substituted under the regular class teacher or special teacher or both. The minimum of sixty minutes a week may be covered in recess periods or in the regular schedule or after the work of the day in other subjects has been finished." See also **MODERN SCHOOL, THE.**

**MORAL OR CHARACTER EDUCATION.** The question of teaching morals or developing the proper character in children and youth has taken definite form in a National Morality Codes com-

petition. An American business man through the National Institution for Moral Instruction has offered a \$5000 prize for the best code of morals suitable for use by parents and teachers in the moral or character education of children in American schools and homes. The purpose of the competition is to determine intelligent public opinion as to what ideas regarding morality and character should be taught in American schools and homes. Seventy of the foremost educators of the country have been enlisted in this competition. This effort represents the most direct and feasible attempt to determine the subject matter of moral instruction that has been made in this country.

**EGGS.** See **FOOD AND NUTRITION; PRICES.**

**EGYPT.** A British protectorate by proclamation of Dec. 18, 1914; lying in the northwestern part of Africa, between 22° and 31° 35' N. lat., and 16° and 37° E. long.

**AREA AND POPULATION.** The area, exclusive of the Sudan, is given as 363,181 square miles, of which only 12,013 square miles are settled and under cultivation. The population in 1907 numbered 11,189,978, not including nomadic Bedouins, estimated to number over 97,000. Of the total population 5,667,974 were males, 5,620,285 females. The census of 1846 returned a population of 4,476,440; that of 1882, 6,831,131; that of 1897, 9,734,405. The estimated population in 1914 of Cairo was 726,075; Alexandria, 413,611; Tanta, 57,623; Port Said, 58,804; Mehala el Kobra, 47,955; Mansura, 44,273; Assiut, 42,751; Damanhur, 38,752; Fayum, 40,499; Zagazig, 38,152; Damietta, 35,407; Minieh, 27,221.

**EDUCATION.** Primary instruction is given in the *maktabs*, or elementary vernacular schools, some under native management and some under the control of the ministry of education. The ministry still retains, under its direct control, certain elementary schools belonging to trusts controlled by the ministry of *Waqis* (pious foundations); these *maktabs* numbered 142 at the end of 1913, with an attendance of 14,027. Higher primary schools, 34, with 7610 pupils; provincial council *maktabs*, 911, with 57,175; private *maktabs* (grant-in-aid), 3394, with 174,282; provincial council high primary schools, 78, with 10,493. Total number of establishments under direct management of the ministry of education, 198, with 27,864 pupils; total number of establishments under inspection by the ministry, 4493, with 253,295 pupils. Of the latter total, 227,434 were boys and 25,861 were girls. A free primary schools has been established in Cairo. There are also government secondary, special, and technical schools and colleges of law, medicine, education, and engineering. A national university under exclusively Egyptian management has been founded at the capital.

**PRODUCTION.** The total area of Egypt is estimated at 232,440,000 statute acres, of which about 7,000,000 acres are formed of the alluvium brought down by the Nile from the Abyssinian hills, the remainder being chiefly limestone desert. Such portions of the alluvial tracts as can be irrigated by the Nile (about 5½ million acres in 1912) are cultivable, irrigation being employed for this purpose on (a) the basin system, the land being divided into rectangular areas of varying size and surrounded by banks, between which the waters of the Nile are admitted during the flood season (August), and there retained for about 40 days, when they are run

off and seed is sown broadcast on the land; and (b) the perennial system, consisting of deep canals containing water all the year round and enabling two or more crops to be grown. For irrigation purposes barrages have been built at Fana and Assiut, and others in the Nile delta have been restored and improved; while a storage dam has been constructed at Assuan, and a barrage built at Zifta. The increase in the value of the land owing to these labors is enormous, and some 2,000,000 acres have been added to the cultivable area.

The crops include wheat, barley, corn (autumn and summer), rice (autumn and summer), and beans; while cotton of excellent quality is grown, the crop in 1914-15 being 7,610,000 *kantars* (99 lbs.). Clover, sugar-cane, and onions are also largely grown, and there are some 30,000 acres of orchards and market gardens. The live stock included 601,136 cattle, 568,388 buffaloes, 39,824 horses, 22,475 mules, and 632,436 donkeys.

**COMMERCE.** By decision of the president of the Council of Ministers dated Aug. 2, 1914, the export of foodstuffs and products (except for necessary supplies to outward-bound ships) has been prohibited since August 3rd. By similar decision dated Oct. 18, 1914: (1) Dealers in rice have been authorized to export all their 1913 stock of Baladi rice. (2) If rice is imported, export from the stock existing in Egypt is authorized up to 50 per cent of the amount imported, to take effect from Sept. 25, 1914. By ministerial decision of October 25th the export of 280,000 quintals of corn has been authorized. By a ministerial decision of April 20, 1915, the export of corn has been permitted without restriction and the same for wheat. The export of raw cotton is prohibited to all ports in Europe and on the Mediterranean and Black seas, other than those of Great Britain and Ireland, France, Russia (except Baltic ports), Spain, and Portugal. The export of cotton to Switzerland and to Greece is permitted until further orders. All cotton so exported must be consigned for Switzerland to the *Société Suisse de Surveillance Economique*, and under recommendation from the British minister at Athens, if for Greece. The export of rice is now prohibited to all destinations. By decision of the Council of Ministers of Sept. 12, 1916, the authorizations for exports of corn and wheat without restriction were canceled. Consequently these articles again come under the general prohibition imposed by the decision of August, 1914.

In the table below are given imports and exports of merchandise in thousands of pounds Egyptian:

	1911	1912	1913	1914	1915
Imports ...	27,227	25,908	27,865	21,725	19,329
Exports ...	28,599	84,574	31,662	24,092	27,047

A table of principal articles of trade, values in thousands of pounds Egyptian for 1915, follows:

Imports	1000 £E	Exports	1000 £E
Textiles .....	5,685	Textiles .....	19,414
Fuel .....	2,561	Cereals, etc. ....	4,619
Spirits, etc. ....	1,621	Metals, etc. ....	763
Cereals, etc. ....	1,583	Animal prods. ....	587
Drugs, etc. ....	1,382	Tobacco .....	249

\* British possessions in the Mediterranean. † British possessions in the Far East. ‡ Including Algeria.

Steamers entered at Alexandria in the 1915 trade, 958, of 1,576,756 net registered tons; cleared, 989 steamers, of 1,682,869.

**COMMUNICATIONS.** There were 1567 miles of state railway in operation March 31, 1915. In addition there were 816 miles of light railways—the Egyptian Delta Light Railways, the Chemins de Fer de la Basse-Egypte, and the Fayum Light Railway.

**FINANCE.** The budget for 1915-16 was estimated to balance at £E15,900,000. Revenue and expenditure for three years are shown in the table below:

	1912	1913	1914-15
Revenue ..£E	17,515,748	£E 17,368,616	£E 15,390,818
Expend. .	15,470,584	15,728,785	16,857,783

The total outstanding debt Jan. 1, 1915, amounted to £E94,028,840, and the annual charge for interest and sinking fund to £E3,551,266.

**GOVERNMENT.** Hussein Kemal Pasha, with the revived title Sultan of Egypt, is the reigning monarch. Sir Arthur Henry McMahon was appointed high commissioner for Egypt. Governor-general, Sir Reginald Wingate.

**HISTORY.** On March 20th, it was announced that an agreement had been reached between the British and Italian governments on various questions, especially those which concerned Italy's representation in the Mixed Courts and the status of Italian subjects. The British government had declared its recognition of Italian interests in Egypt, and its acceptance of the principle of equality in the treatment of Italian colonials and the colonials of other powers. The agreement relieved the Italian colony of certain technical disqualifications and as a result improved the relations between the Italian and British governments. It also raised the question whether the time would not soon come for the removal of that burdensome treaty known as the Capitulations, which pertained to Turkish sovereignty, and which on the downfall of the Turkish power seemed no longer necessary. It had been supposed that after the failure of the Dardanelles campaign, the Turkish forces thus set free would attack Egypt, but there was no serious invasion, although the hinterland of Western Egypt was overrun by Mohammedan tribesmen. In the Sudan for some time past

there had been disaffection in the portion of the Sudan under the Sultan of Darfur. In February he began to gather forces near the Kordofan frontier. A British force was assembled by Colonel Kelly, and advanced against the enemy on May 15th. On the 25th the British were reported to have defeated the Sultan's forces and the Sultan was said to have fled. See also ARCHÆOLOGY.

**EIGHT-HOUR DAY.** See LABOR.

**ELECTION LAWS.** See ELECTORAL REFORM.

**ELECTORAL REFORM.** The fact that but few of the State legislatures were in session in 1916 accounts for the comparatively small number of measures passed affecting the electorate. Even those legislatures which did have sessions did not pass many measures of the first importance.

As the so-called "grandfather" clause in the Oklahoma Constitution was pronounced unconstitutional by the United States Supreme Court in 1916 the Legislature of 1916 proposed a new amendment changing the description of the persons excepted from the literacy test to those who have seen military or naval service, including service in any foreign nation, and their descendants. This varied the usual "grandfather" clause, which confined the ballot to the military and their descendants. The New Jersey Legislature passed a measure requiring registration in person or by affidavit, in municipalities of more than 10,000. The provision for registration by affidavit was new, and provides for persons prevented by illness or absence from the State from registering in person.

Absentee voting was provided for in Oklahoma and Virginia. In Oklahoma voting in another precinct by a vote absent from his own county is permitted, and in Virginia absent voters may vote by registered mail. The Massachusetts Legislature regulated the primary ballot arrangement of candidates for delegates to national conventions. Preference for President must be entered on the ballot if declared by candidates, and consented to by the person preferred. This consent may be communicated by telegram or cable. The Massachusetts Legislature also repealed, subject to referendum, the 1914 law authorizing a single ballot for all parties to primary elections, and restored the 1913 requirement of separate ballots to each party. The California Legislature at a special session amended the direct primary and presidential primary laws. The previous law provided for registration without declaration of party affiliation, but that act was refused by the voters on referendum. The amendment of 1916 provided for a declaration of party affiliation at the time of voting at a primary election instead of at the time of registration. The Legislature of Maryland amended the election law so as to abolish what is known as the "envelope" system of voting at primary elections. The Legislature of South Dakota in special session amended the primary law. It advanced the date fixed by the law of 1915 for the general primary to obviate the necessity of two primaries in the presidential year, one for State officers, and the other for national conventions. The law also contains new provisions as to nominating delegates and expressing preference for President. The Legislature of Louisiana enacted a primary law providing that all party candidates for State or local

offices, including United States Senator and Congressmen, shall be nominated by direct primary, and a general election dealing with nominations, ballots, etc. The Kentucky Legislature enacted a corrupt practices act, prohibiting corporation contributions to and limiting amounts of campaign expenses and annulling elections in certain cases of violation.

**INITIATIVE, REFERENDUM, AND RECALL.** The Oklahoma initiative and referendum law was amended in respect to the distribution of publicity pamphlets. If public officers fail to print and distribute the required pamphlets an elector may petition to the court to mandamus, but failure to print and distribute such pamphlets is not to invalidate any election. In Mississippi a constitutional amendment adopted in 1914 authorizing the initiative and referendum was put into effect. This amendment applies to constitutional amendments as well as statutes.

**STATE CONSTITUTIONS.** The Massachusetts Legislature submitted to the general election in 1916 the question of calling a constitutional convention. The resolution calls for the election of 320 delegates to be elected on the first Tuesday of May, 1917, and a meeting of the convention on the first Tuesday of April following. Nomination and election by delegates must be non-partisan ballots.

**CORRUPT PRACTICES.** A strict corrupt practices bill was introduced in the Senate by Senator Owen of Oklahoma and was taken up on September 6th, after an unusually bitter and violent debate. The Republican leaders objected to the consideration of the bill at that time, but it was finally voted to consider it. The bill, which was a substitute for a similar measure passed by the House, limits the total amount to be expended by national campaign committees to \$400,000. Individual contributions are limited to \$5000. The bill prohibits the buying of votes by direct or indirect means. It forbids all contributions by corporations for political purposes, and imposes heavy penalties for violation of the law. The general purpose of the measure is to strengthen the present law relating to corrupt practices, which is considered weak in its limitations on the use of money in elections. The Senate adjourned without taking final action on the measure. See UNITED STATES, *Presidential Campaign*.

**ELECTRICAL INDUSTRIES.** These industries in 1916 in the United States shared in the activity and prosperity common to most fields of commerce and manufacturing. Conditions created by the war and causing a demand for products that had formerly been largely imported into the United States led to the development and improvement of many electro-chemical processes. T. C. Martin, whose annual table of statistics for the electrical industry is so well known, gives the accompanying tabulation as representing approximately the gross earnings of the chief electrical enterprises during the year:

Telegraphy—all kinds .....	\$150,000,000
Telephony .....	400,000,000
Central stations .....	500,000,000
Electric railways .....	750,000,000
Isolated plants .....	150,000,000
Electrical manufacturing .....	550,000,000
Miscellaneous .....	125,000,000
<b>Total .....</b>	<b>\$2,625,000,000</b>

In the line of manufactures it was estimated that 1916 experienced a total value of electrical goods of all kinds equal to \$500,000,000—a large increase over 1915. Exports of electrical material were also very large, totaling not less than \$35,000,000.

Conservative estimates of the amount of business done by the three great electrical manufacturing companies in the United States indicated that up to December 31st, the General Electric Company had a total volume of sales equal to \$150,000,000; the Westinghouse Company and the Western Electric Company had each gross sales of \$100,000,000, and the latter reported that at the end of the year unfilled orders on its books would amount to almost \$125,000,000.

In addition to the use of electric power in new industries owing to the war, there was a great increase in its application to steel furnaces. (See METALLURGY.) In the manufacture of alloy steels, the electric furnace was found to give far more satisfactory results than any method that had been used. There was a great increase in the use of electric power also for the electrolysis of water for the production of oxygen and hydrogen on account of the increasing demand for these two gases for many purposes. Many plants also were using the electrolytic processes for producing "hypochlorite solution," or bleaching liquor for laundry uses. While not by any means new, electrolytic plants for the refining of zinc and copper were largely increased.

The location of many electro-chemical plants near New York City during the year was noted. The former considerations that governed the location of electro-chemical plants within a short distance of Niagara Falls were no longer effective for the reason that the available power capacity at that point had been reached; but there were many plans about to be put under way at the close of the year for the location of new industries near the Southern hydro-electric plants where the supply of energy was abundant and cheap.

**ELECTRIC BATTERIES.** Although steady progress in the use of electric vehicles was noted during the year, there was no marked improvement in storage batteries. Types had become standardized for commercial purposes, and their capabilities and efficiencies were well known; but nothing of an epoch-making nature was produced. A few new primary cells were brought out, some for laboratory standards, and some for ignition purposes; but on the whole, these were merely modifications of already well known cells.

**ELECTRIC GENERATORS AND MOTORS.** See DYNAMO-ELECTRIC MACHINERY.

**ELECTRIC LIGHTING.** Progress in electric lighting during 1916 was along somewhat restricted lines. There was a great increase in the number of units available in gas-filled tungsten lamps. The manufacturers in response to constantly increasing demands seemed to have been able to produce these lamps in almost every size and capacity for which the old style carbon lamps had been made. Their use was varied correspondingly, but it must be noted that in certain instances, owing to the intense brightness of the gas-filled lamp, illuminating engineers have found it desirable to shade these units with some form of translucent globe for exterior

illumination, and with globes that would act efficiently as color screens for interior use. A better educated public taste and the ever increasing influence of the suggestions of illuminating engineers were bringing about considerable change in the types of interior illumination, particularly for places of amusement and other public buildings. While for certain purposes it was deemed important to attain as nearly as possible day-light illumination with artificial illuminants, it was found that such arrangements must be used with due regard to the buildings or areas to be lighted, as well as to the effect of the lights upon the eyes of the majority of persons exposed to them. For street illumination, there was, as was pointed out in the 1915 YEAR BOOK, a rapid and progressive change from the arc lamps, formerly almost universal for this purpose, to some of the more powerful types of gas-filled tungsten units, not only on account of the higher efficiency of the latter, but also on account of the ability to arrange these units more effectively at a given cost for energy than could be done with arc lamps. The flaming and other types of luminous arcs, however, were still very largely employed for street lighting purposes. Operating at high efficiency and having a low maintenance cost, they prevented the still wider introduction of the gas-filled incandescent lamps, and it was seriously questioned whether, for this particular field, the limit of usefulness for the latter had not about been reached.

It was noticeable also in connection with improvements in both public and domestic lighting arrangements that far more regard than ever before was paid to the physiological effect of the number and arrangement of lights on the persons exposed to them. Much greater attention was paid in the schools and colleges to the lighting arrangements wherever any task involving close work with the eyes was in question. Among other matters the Life Extension Institute, of which Dr. Eugene Lyman Fisk is director, was directing the attention of its members to the importance of preserving eyesight by every possible means. A noticeable advance in search-lights was made during the year in the development of the Sperry light and projector.

While not involving any new principle, the increasing use of flood-lighting for large structures, such as buildings and statues, was one of the events of the year. While flood-lighting had been employed as a means of brilliantly illuminating a group of buildings or portions of a particular building, it was formerly accomplished by means of search-lights, whose rays were directed at such an angle as to be reflected from portions of the structure and produce striking contrasts of light and shadow. During the past year, however, the same kind of effect was produced with a smaller consumption of energy, and with better results from the standpoint of illumination by employing a large number of gas-filled incandescent lamps, the rays of which were concentrated by reflectors on those portions of the structure that were to be illuminated. The design of many buildings made this matter an easy one by allowing the lights to be so located on the building itself as to be invisible to the ordinary observer. The Statue of Liberty in New York Harbor was thus illuminated with great success, from both an artistic and an engineering standpoint, and a ceremony, in which

the President of the United States participated, inaugurated the new system. The City Hall in New York and other buildings elsewhere were similarly set-off by this kind of lighting, which produces effects of an entirely different character from any that could be secured either by means of search-lights or by the older method of outlining a structure with strings of incandescent bulbs.

**ELECTRIC POWER, TRANSMISSION OF.** There were no large new undertakings in the transmission or distribution of electric energy during 1916. The high price of copper and aluminum constituted one of the causes of this condition, for it was realized that the market for these metals was at a temporary high level from which it might fall suddenly as soon as the conditions existing during the year had passed. Another and very potent factor making for hesitation and timidity of capital was the unsettled state of water-power legislation. The policy of the United States government towards those desirous of developing water-powers was in a chaotic condition and many of those who advocated more liberal methods of dealing with the promoters of such enterprises were assailed as being in the employ of special agents of a so-called "water-power trust," etc. Several measures were about to be considered by Congress, but up to the close of the year nothing was done.

In this connection, too, the subject took on added interest on account of the inability of American manufacturing plants at Niagara Falls to obtain energy any longer from the Canadian power companies by reason of the war. A bill was under consideration by Congress for granting the privilege of using a certain additional quantity of water from the American side of the Falls to relieve the plight of manufacturing plants there.

The established hydro-electric power companies were doing an increased amount of business in the sale of energy to electro-chemical plants within reach of their distribution lines. In connection with their business activities it was also noticeable that many interurban electric railways were arranging to obtain an additional supply of energy when needed from those companies, instead of building new generating stations. It was the general belief among electrical engineers that in the further electrification of steam railways, the latter would become valuable customers of the large electric power companies. One of the most important instances of this tendency was the purchase of electric energy by the Chicago, Milwaukee, and St. Paul Railway from the power company located at Great Falls, Montana. In connection with the government policy of preparedness, an appropriation was made by the Sixty-fourth Congress for the establishment of a plant for the production of atmospheric nitrogen. (See CHEMISTRY, INDUSTRIAL.) While this seemingly afforded an excellent market for the output of electric generating stations in that part of the South where power plants had been located, it was not believed by engineers that the process could compete successfully on a commercial scale with other methods for the production of nitric acid. In various parts of the United States plans were under way for the inter-connection of many large electric power systems for the purpose of equalizing the load among many large systems, and at the same time securing power at a minimum cost to the con-

sumer. The number of large power companies and the varying needs of the districts which they serve render this problem difficult of solution.

In its technical aspects the transmission of electric energy did not show any special advance over 1915, the same kind of generating and receiving apparatus being employed; and while the transmission of high tension direct currents, as had been practiced in Europe on a limited scale, was discussed, it was not applied in the United States to actual practice.

There was no change in the degree of voltage employed on energy transmission lines, the maximum remaining at 150,000 volts, as had been found desirable on several lines in 1915; and 100,000 volts had become standard for circuits of more than ordinary length. The improvement in the quality of insulators, and the great attention given to the maintenance of such lines, reduced greatly the troubles formerly experienced. An increasing tendency to place switching devices and transformers out of doors, thereby involving much lower initial cost, was also a marked feature of the year's practice. These outdoor sub-stations seemed to give satisfactory service under every climatic condition to which they had been exposed.

**ELECTRIC RAILWAYS.** Owing to the difficulty experienced by the railways in securing additional capital, and the high prices of material that prevailed, the application of electric power to steam railways made little notable progress during 1916. Undertakings already started, were being completed during the year, it is true; and under more dependable financial and economic conditions it is likely that many new electrification plans would have been put into execution. As mentioned in the 1915 YEAR BOOK, the electrification of the mountain divisions of the Chicago, Milwaukee and St. Paul Railway was pushed rapidly in 1916, 406 route miles being so equipped, and it was expected that the entire 440 miles of route between Harlowton, Mont., and Avery, Idaho, would be under electric operation early in 1917. The 3000-volt direct current locomotives put in use on this line in 1915 proved in service capable of doing even more than had been expected of them, having ample tractive power for all conditions of weather and being more dependable than steam locomotives during periods of severe cold waves. They hauled 3500-ton trains up 2 per cent grades at satisfactory speed. From both a mechanical and an operating standpoint, the electrification of this road was an unqualified success.

One feature of the St. Paul locomotives, which were built by the General Electric Company, that attracted wide notice from engineers and railroad men, was the system of regenerative control. This had not been applied to direct current locomotives before, and the experience on the St. Paul demonstrated that it was entirely capable of controlling the heaviest trains on the steepest grades, as well as effecting a considerable saving in the wear of brake shoes and wheel treads.

The Pennsylvania Railroad during 1916 was applying its projected electrification to its line between Philadelphia and Chestnut Hill, about 12 miles, and it was the intention to operate it with motor cars propelled by alternating current obtained from overhead conductors, as was done on its line to Paoli during the previous year.

Both the New York Central and the Butte, Anaconda, and Pacific added to their already large equipment of electric locomotives. These were of the same type that had been in use, and afforded a confirmation of the reliability of this type shown by a continuous service of several years.

Satisfied with the successful operation of electric locomotives, the Norfolk and Western was adding 15 miles of electrified line, equivalent to 50 miles of single track, at the western end of its electrified section in West Virginia, described in the 1915 YEAR BOOK. Part of this work included branch lines tapping the coal mining districts.

In Canada, the Canadian Northern, which had almost ceased work on its Mt. Royal tunnel on account of the war, was resuming operations toward the end of the year. It may be recalled that this involved the electrification of the line from a new station in the city of Montreal, through a tunnel under Mt. Royal, to a point about nine miles out. 2400-volts direct current supplied through overhead conductors was the system adopted, and a few of the electric locomotives had been delivered and were being used on construction work at the close of the year.

In England, the electrification of several steam railways was continued during the year. The London and South Western Railway equipped about one hundred and fifty miles of its suburban lines near London with the direct current system, the energy being supplied through a third rail. The London, Brighton, and South Coast was also operating a limited service near London, and had under consideration a much more extensive plan for future development. The London and North Western had also equipped a portion of its lines with electric power, but owing to the heavy construction work involved at certain points, the scarcity of labor, and other war conditions, a comparatively small part of the projected scheme had been carried out at the end of the year. See also SWITZERLAND.

**ELEVATOR, GRAIN.** A notable grain elevator with an ultimate storage capacity of 10,000,000 bushels was under construction during the year for the Armour Grain Company at 124th Street and the Calumet River, Chicago. This would be the largest grain elevator in the world and could be compared with that of the Canadian Northern Railway at Port Arthur. The working house of the Chicago elevator was to have a bin capacity of 1,000,000 bushels and be able to receive and dispatch 360,000 bushels in 10 hours. Grain could be discharged from ships at a rate of 20,000 bushels per hour and from storage into barges on the river side at a rate of 120,000 bushels per hour. The elevator consisted of circular storage bins of concrete 105 feet high and 22½ feet in diameter. See CONCRETE.

**ELGAR, SIR EDWARD.** See MUSIC, *England*.

**ELIZABETH, DOWAGER QUEEN OF RUMANIA,** known generally by her pen-name, "Carmen Sylva," died at Bucharest March 2, 1916. She was born at Neuwied, the capital of the mediatized principality of Wied, in 1843, her father being Prince Hermann of Wied and her mother Princess Marie of Nassau. From the former she inherited the literary tastes and abilities which were to give her a unique place among European monarchs. She mastered several languages, gave great promise as a musician, and grew up with democratic sympathies. In 1869 she was married to Prince Charles of Hohenzollern, who had been chosen Prince of Rumania, and who in 1881 became King. They had but one child, a daughter, who died at the age of four. King Charles died in 1914. From the beginning of her residence in Rumania, Queen Elizabeth identified herself with the life of the people. She interested herself especially in the native artistic industries, handicrafts, and embroideries; founded charitable institutions, becoming especially known for her work for the wounded during the Russo-Turkish War; and was the patron of Rumanian artists and writers. She herself wrote first anonymously, then as Carmen Sylva; her authorship did not long remain a mystery. Although she published 20 volumes in German, which was her native language, and only one in another language, English, her sympathies were always with the French. Two of her well known collaborators were Mite Chremnitz and Helen Vacaresco. Translations of Carmen Sylva's works have appeared in 11 European languages. Among her collections of Rumanian legend and folklore, a subject that greatly interested her, is *The Bard of the Dimbovitza*. The Prix Botta of the French Academy was awarded in 1888 to her volume of prose aphorisms, *Les Pensées d'une Reine*. Others, in English, are *Pilgrim Sorrow*, *A Real Queen's Fairy Tales*, and *From Memory's Shrine* (reminiscences). In 1882 she was elected a member of the Academy of Sciences at Bucharest, and in 1914 honorary fellow of the Royal Society of Literature of the United Kingdom.

**ELKUS, ABRAM I.** An American lawyer and publicist, appointed Ambassador to Turkey by President Wilson July 18, 1916. He succeeded Henry Morgenthau, who resigned to take an active part in the President's campaign for reelection. Mr. Elkus was born in New York in 1867 and attended the University of the City of New York and later Columbia Law School. After his admission to the bar in 1888, he practiced law in New York. He served as special United States attorney in prosecution of bankruptcy frauds, as counsel for the Merchants' Association of New York, and in 1911-12 as counsel for the New York State Factory Investigating Commission. The laws passed on the advice of this commission and designed to improve industrial conditions, especially as regards child labor and the labor of women, were drafted by Mr. Elkus. In 1911 he became a regent of the University of the State of New York. Since the Democratic National Convention of 1912 he has been known as a supporter of Mr. Wilson.

**ELLIS, EDITH M. O.** (MRS. HAVELOCK ELLIS). An English Socialist, author, and lecturer, died in London, Sept. 14, 1916. Born in 1861 into a Lancashire family named Lees, she became secretary of the New Life Fellowship,

an organization allied with the socialistic Fabian Society. At that time she met Havelock Ellis, whom she married in 1891. Her husband became a leading English sociologist, and she herself, a believer in various social reforms, wrote on such subjects as *A Novitiate for Marriage*. Although her own marriage was a happy one, she maintained that it was right and desirable for a wife to be economically independent; so she hired a cottage in Cornwall and made a living partly from the land, partly from lecturing, and partly from her writings, chief of which were stories about the Cornwall people. She published: *Kit's Woman: A Cornish Idyll, Attainment, My Cornish Neighbors, The Imperishable Wing, Love Acre, Three Modern Seers*, and three plays entitled *Love in Danger*. In 1915 Mrs. Ellis lectured in the United States. Her body was cremated and the ashes scattered on Hampstead Heath.

**ELLIS, EDWARD SYLVESTER.** An American writer of boys' stories and historical books, died at Cliff Island, Casco Bay, Maine, June 20, 1916. His home was in Montclair, N. J. Mr. Ellis, who was born at Geneva, Ohio, in 1840, was for some time a teacher, becoming principal of the high school in Trenton, N. J., and later superintendent of schools there. Success in telling stories to some of his earliest pupils led him to devote himself largely, after 1876, to the writing of juveniles, and it is in this field that he became noted. His "Deerfoot" and "Ned" Series were among the most popular. Of *Seth Jones, or the Captive of the Frontier* 500,000 copies were sold, and translations were made into 11 languages. Altogether, Mr. Ellis was author of more than 100 books of this type, some written under the pen name of "Lieut. R. H. Jayne." In addition he prepared many text books for schools, especially on American history.

**EMPLOYERS' ASSOCIATIONS.** See TRUSTS.

**EMPLOYERS' LIABILITY.** See WORKMEN'S COMPENSATION.

**ENGINEERING.** In any record of engineering progress and development in 1916, two features must stand out with special prominence. First, the ever increasing dependence of the fighting armies and navies in Europe on mechanical, technical, or other scientific appliances and methods, so that modern military engineering might be said to be inclusive of all civil engineering, using the term broadly and in its oldest sense. Second, that the peculiar economic existing conditions required of engineers that they devote themselves to problems of production, construction, and operation so as to secure maximum results immediately rather than desire new methods or innovations in design. Obviously such conditions were necessary corollaries of the great war, and the part played by engineering will be more than suggested by reference to the article on MILITARY PROGRESS. Such mechanical appliances as the "tanks" or caterpillar motors, the development of involved machine guns, and other ordnance, the use of machinery for trench digging, and the wholesale manufacture and use of asphyxiating gases and liquid fire, may be cited as a few instances where the arts and mechanism of peace were applied to war.

Likewise the development in AERONAUTICS (q.v.) represented mechanical engineering of a special and refined type which had brought about a more efficient internal combustion motor with the power and reliability requisite for sustained flight, as well as aeroplanes of stronger frame and sustaining surfaces.

The part played by the engineer in NAVAL PROGRESS (q.v.) was quite as conspicuous. The naval architect was designing BATTLESHIPS (q.v.) and battle cruisers of ever greater size and speed, and their propelling machinery alone presented new and interesting problems for the marine engineer to solve in one way or another. The SUBMARINES (q.v.) as engines of destruction continued to show developments in seaworthiness and increased radius of operations, and this too was the result of the work of technical men in designing and constructing no less than skillful seamanship.

In all fields of engineering the war had the effect of stimulating production to a maximum, especially where the products had a direct relation to the struggle, and indirectly where ordinary sources of production were closed or restricted. Thus to supply copper the metallurgical engineers were forced to extend the capacity of old plants and build new works where the latest methods were installed on a large scale (see METALLURGY). For IRON AND STEEL (q.v.) all facilities of production were more than taxed in a record-breaking year for the American industry. Everywhere there was a demand for machinery for the manufacture of munitions of war both in the United States and in Europe, and all was of the latest and best types yet without opportunity for experiment of improvement. In this field of increased production the chemical engineer was playing his part and under CHEMISTRY, INDUSTRIAL, may be found some record of new developments involving huge plants for the manufacture of explosives, dye-stuffs, nitrates, metals, alloys, etc. In mechanical engineering an important branch is the automobile (see AUTOMOBILES) and, while the technical developments of the year were in no way striking, yet various economic and industrial considerations were closely allied to engineering progress. In all of this in the field of organization and works and management and labor adjustments there was a distinct note of progress.

Discussing civil engineering proper, one finds under such individual heads as AQUEDUCTS; BRIDGES; CANALS; DAMS; DOCKS AND HARBORS; DRAINAGE; FLOODS AND FLOOD PREVENTION; FORESTRY; IRRIGATION; LIGHTHOUSES; RAILWAYS; ROADS AND PAVEMENTS; TUNNELS; WATER WORKS AND WATER PURIFICATION, important fields where important developments of the year are chronicled. Thus the extension of the Catskill Aqueduct marked further progress in the great scheme of water supply for New York, while the failure in hoisting into position the central span of the ill-fated Quebec Bridge afforded one of the now rare examples where plans and calculations of engineers are upset, with resultant and serious damage. The improvement of the docks and harbors in the United States was of particular interest in 1916, as was the attempt of many communities in the Middle West to deal effectively and once and for all with the menace of floods.

In railways the engineer was forced to subor-

minate construction to economics of maintenance and operation even under unusually heavy traffic, and to share with the financiers and practical economists the burdens of efficient administration which peculiar conditions in the United States made essential. In Europe the operation of the railways since the war had become a military problem, and one that in practically all the warring nations was being solved effectively under abnormal conditions. Great tunnels were being completed in 1916, and while little new work was set on foot some ambitious projects were advanced for discussion.

The problems of municipal and sanitary engineering continued to attract attention in 1916. MUNICIPAL OWNERSHIP (q.v.) often brought the engineer before the public more prominently, and such fields as CITY PLANNING, SEWERAGE AND SEWAGE TREATMENT, and GARBAGE AND REFUSE DISPOSAL (qq.v.) showed progress which is given in the usual articles elsewhere.

The distinct improvement in FIRE PROTECTION (q.v.) manifest in 1916 unfortunately did not appear in the annual fire loss statistics on account of several serious conflagrations or fires due to the abnormal conditions of war traffic and munitions manufacture. In ARCHITECTURE (q.v.) activities continued in 1916 (see also BUILDING OPERATIONS), while such materials of construction as CONCRETE (q.v.) figured with even greater importance.

In electrical engineering perhaps the manufacturing side bulked the largest in 1916, for under ELECTRICAL INDUSTRIES (q.v.) an extraordinary record of American activity is summarized. In ELECTRIC LIGHTING (q.v.) the progress of previous years continued with such developments as flood-lighting. Under ELECTRIC RAILWAYS (q.v.) the steps towards the fuller realization of the electric operation of main lines are detailed. No limit seemed to have been reached for generators, for under DYNAMO-ELECTRIC MACHINERY (q.v.) we may read of some units of great capacity. The transmission of ELECTRIC POWER (q.v.) figured again, while the scope and range of WIRELESS TELEGRAPHY (q.v.) was again extended.

The unusual conditions of the war brought about great activity in marine engineering in the United States, and SHIPPING and SHIPBUILDING (qq.v.) continued the growth of 1915 on a scale much greater than could have been recorded in earlier issues of the YEAR BOOK, not only in the field of warship construction, but large ocean craft for international trade, as well as coastwise craft. As regards prime means the demands of new plants produced new calls for BOILERS; STEAM ENGINES; STEAM TURBINES; and INTERNAL COMBUSTION ENGINES (qq.v.); without however any striking novelties of design. The derivation of power from a volcano as developed in Italy was certainly an interesting item of the year (see VOLCANOES).

The foregoing titles and subjects indicate some of the fields where the progress was of special interest and where the individual articles elsewhere in the YEAR BOOK may be consulted with profit. They do not, however, reflect any startling developments or novelties in design and construction, and the wholesale preoccupation of European engineers in military activities and those of America in productive enterprises furnishes a ready explanation. Technical advances were by no means to stop, however, for a certain

amount of experimental work was in progress even in connection with war enterprises, while such institutions as the United States Bureau of Standards, and research committees or laboratories of professional societies or educational institutions continued their labors.

**ENGLAND.** See GREAT BRITAIN.

**ENGLAND, CHURCH OF.** During 1916 all church questions were necessarily considered in relation to the great war. The Archbishops of Canterbury and York called on the church to take up a great spiritual movement which has been designated "The National Mission of Repentance and Hope." This occupied the months of October and November, 1916. The Archbishop of Canterbury, speaking for the bishops, said: "We believe that if the victorious outcome which we expect and pray for in this war is to take shape, in every sense, for good, we must recognize plainly, outspokenly, deliberately, humbly, that there are a great many faults of ours to be corrected, a great many weak, wayward efforts to be refashioned by God's help into something straighter and stronger. We are very far as yet from having secured, among the men and women of our land, clergy or laity, military or civil, that sort of spirit. If we are to get it we must think of it, strive for it, pray for it—yes, above all, pray for it. That is what our national mission is for. We are going to try, by every corporate and separate effort that we can make, under the guidance of our living Lord, to create and foster that true spirit to quicken our eyesight as to what our faults have been."

One of the results of the war has been the erection of numerous wayside crosses or Calvaries, in memory of those who have died for their country. It was felt that this practice would be more fruitful of good results than that of putting brass tablets in a public building. Prayer Book revision has been put aside for the present, as the lower house of the Convocation of Canterbury at its winter session postponed the revision scheme. An active movement in behalf of the repeal of the Welsh Church Act was going on in 1916. The commissioners under that act have asked from the clergy full information as to parochial endowments and other sources of income. The Bishop of St. Asaph said that under the act incumbents appointed since September, 1914, have no existing interests in their benefices, and that as a result, when the war ends and the act takes effect, these benefices will be left without a farthing of the ancient endowments, and the priests appointed thereto will have no vested interests.

The committee appointed to consider the need of new dioceses and the readjustment of new boundaries within the Province of Canterbury reported that a further subdivision of dioceses is necessary, that a diocese should not exceed 300 parishes, and that the appointment of bishops suffragan in overgrown dioceses is only desirable as a temporary expedient. Rev. Dr. Wild, Archdeacon of Nottingham, was consecrated Bishop of Newcastle at York Minster. The King nominated Rev. F. T. Woods to be Bishop of Peterboro.

**ENGLISH LITERATURE.** See LITERATURE, ENGLISH AND AMERICAN.

**ENGLISH PHILOLOGY.** See PHILOLOGY, MODERN.

**ENTOMOLOGY.** A noticeable development in recent economic entomology has been the in-

creasing attention paid to insects as carriers of human diseases and the housefly, or "typhoid" fly as Howard has named it, has received the greater amount of this attention in temperate climates. Experiments reported during the year 1916 had to do with the discovery of methods of destroying the larvæ, with destruction of the adults, and with the method of distribution of the adults as bearing on the question of their elimination. It was generally agreed that horse manure is the usual breeding place for these insects, and although they may occur in great numbers in other places such as garbage receptacles, they go to these places for food and not to lay their eggs. Garbage which is of an acid reaction is fatal to the larvæ, and hydrochloric acid to be sprinkled over manure is recommended as a larvicide. Other larvicides recommended were borax and hellebore in the proportions respectively of two-thirds of a pound, and one-half pound, to ten gallons of water sprinkled over eight bushels of manure. Another formula was calcium cyanid and acid phosphate, using one-half pound of each per bushel of manure. The distribution of flies is in response to tropic stimuli, those leading to feeding and those leading to egg laying being apparently different from one another. It is not certain to what extent flies go with the wind, and to what extent against or across it, but experiments show that they will go for more than a mile if necessary in order to procure food.

Termites do much damage to wooden foundations of buildings and the obvious remedy is to replace them with concrete. Snyder recommended in cases where this is not possible, the soaking of timbers not in contact with the ground in a 6 per cent solution of zinc chloride or a 1 per cent solution of mercury bichloride. Timbers in contact with the ground may be impregnated with tar creosote. Experiments have been tried of putting poisonous substances into wood pulp materials, but these have not been successful. In connection with the study of termite activities, it was reported that in the hurricane of 1915, the previous mining of timbers in houses in New Orleans had so weakened them that a much greater amount of injury than would otherwise have happened was done by the hurricane.

The Argentine ant appeared in California in 1905 and in 1916 was reported as having spread over a territory 700 miles long. It was especially troublesome in the vicinity of Berkeley, where preventive measures were fairly successful if undertaken by the municipality but not if under private management.

As publication No. 3 of the British Museum Economic Series, Wasterson wrote on *Fleas as a Menace to Man and Domestic Animals*, the paper having reference to the part these insects play in carrying the plague bacillus.

For the work of the Federal Bureau of Entomology the sum of \$868,880 was appropriated for the year beginning August 1, 1916. This is in addition to the amounts appropriated by the several States in carrying on their regular entomological work, and for special investigations such as the gypsy moth work in New England. See also ZOOLOGY.

**ENTRANCE REQUIREMENTS, COLLEGE.** See UNIVERSITIES AND COLLEGES.

**EPILEPSY.** Reed's announcement in 1914 of his belief that constipation was a very essen-

tial factor in the causation of epilepsy, and later that he had isolated a bacillus from the blood of epileptics, which bacillus, flourishing in the intestine, produced the toxic substance which brought on epileptic attacks, was responsible for a good deal of discussion and research by other investigators. In a communication appearing in the *Journal of the American Medical Association*, May 20, 1916, Reed describes the organ as a spore-bearing bacillus, staining best with carbolfuchsin, less satisfactorily with methyl blue and by Gram's method. The organisms grow freely either in agar-agar or bouillon, 104° F. being the favorite temperature. Growths appear from the second to the fifth day, when a smear shows the organism, which may be recognized as a short, thick bacillus, with blunt ends. The bacillus is actively motile. Sporulation becomes marked as the culture grows older, until the nutritive substance in the medium is exhausted, when the bacillus itself disappears, leaving behind it its spores. Experimental studies of this organism were made with rabbits, first by injecting a suspension of the bacilli into the veins. Apparently typical epileptic seizures were produced and from the blood of the inoculated animal the specific bacillus was recovered. Suspensions were also injected into the peritoneal cavity to determine the toxicity of the germ. The animal died in about seven hours and on autopsy death was shown to be obviously due to toxic absorption. Reed is of the opinion that the human epileptic is infected through the alimentary canal; he also believes that the infection may be communicated from one person to another. Reed calls attention to the fact that Bra, in 1902, in a communication to the French Academy of Science, announced that he had isolated an organism from the blood in 70 out of 100 cases; that he found it only in epileptics and only preceding or immediately following a seizure; that it disappeared from the blood in the interval. Reed's claims are supported by the investigator Terhune, who found that in cultures made from the blood of 24 epileptics during or immediately following seizures the bacillus was present in 75 per cent.

**EPIRUS.** Anciently the northwesternmost division of Greece. This region in modern times has had no definite political boundaries, and the name Epirus has been applied to Southern Albania and Northwestern Greece. Part of Albanian (Turkish) Epirus was annexed to Greece after the Balkan wars of 1912-13; in November, 1914, Greece occupied northern Epirus and in March, 1916, formally took possession of it. The population of Epirus is more or less conjectural, but is supposed to approximate half a million. The towns include Janina (population about 16,800), Argyrocastron (12,000), and Koritza (8000).

**EPISCOPAL CHURCH.** See PROTESTANT EPISCOPAL CHURCH.

**EPWORTH LEAGUE.** See articles on Methodist denominations.

**ERITREA.** An Italian colony on the west shore of the Red Sea. Estimated area, 45,800 square miles; population, 279,000. Asmara is the capital. There are 74 miles of railway. Imports and exports were valued in 1913 at 20,453,500 and 11,589,744 lire respectively; transit, 2,895,778 lire. The 1913-14 budget balanced at 13,444,851 lire.

**ETHICS.** See PHILOSOPHY.

**ETHIOPIA.** See ABYSSINIA.

**ETHNOGRAPHY.** See ANTHROPOLOGY.

**ETHNOLOGY.** See ANTHROPOLOGY; PEABODY MUSEUM.

**EUGENICS.** Rapid strides have been made, during the past year, in the popularization of knowledge in this field. The war has called forth an unusually large number of books and articles dealing with the probable biological effect of the conflict upon the race. Foremost among these, perhaps, is David Starr Jordan's *War and the Breed* (Boston), in which the idea that war is an important factor in changing the inborn nature of the human race is explained with a wealth of illustration and in a most readable way. Another book of importance, on the same theme, is George Nasmyth's *Social Progress and the Darwinian Theory—a Study of Force as a Factor in Human Relations* (Introduction by Norman Angell) (New York). A third is W. E. Ritter's *War, Science, and Civilization* (Boston). A less specialized book is Prof. M. F. Cuyler's *Being Well-Born* (Indianapolis). *The Jukes in 1915*, by A. H. Estabrook, published in 1916 by the Carnegie Institution of Washington, brings the history of that remarkable family down to date. F. J. Warne's *The Tide of Immigration* (New York), among other topics, discusses the eugenic effects of differential birth rates among immigrant stocks. The eugenic effects of changes in birth and death rates was also discussed by Prof. W. F. Willcox, of Cornell University, in a remarkable paper read at the Second Pan American Scientific Congress, held at Washington, D. C., entitled: "Fewer Births and Deaths: What Do They Mean?" His most important conclusions were as follows: (1) The death rate cannot be expected to fall much below where it now stands in healthy districts. (2) There is no such natural limit to a fall in the birth rate. (3) The spread in the volitional control of the birth rate is a change against which, even if we believe it undesirable, it is hopeless to struggle. (4) Legal regulation of marriage in the effort to diminish the number of births of diseased or otherwise undesirable children seems likely, unless accompanied by segregation, to do more harm than good. (5) The social service rendered by parents who have hereditary qualities of great value and make heavy sacrifices in other directions in order to rear families of normal size or larger, is likely in the future to be much better appreciated and requited. (6) Persons interested in maintaining the numbers and improving the quality of the population should aim not merely or mainly at a continued reduction of the general death rate, but also at the gradual education of public opinion towards a readjustment of the birth rate in various classes which will enable society to gain from its best strains more than it can do under present conditions. Another article of great importance was that of Dr. J. C. Phillips, published in the *Harvard Graduates' Magazine* for September, 1916, on "Harvard and Yale Birth Rates." In it explicit and startling information is given concerning the rapid decline in the size of the families of graduates of these institutions during the past 40 years. Excellent

evidence of a growing attempt to combat such conditions is found in *The Mothercraft Manual* (Boston), by Mary L. Reed, Director of the School of Mothercraft in New York City. For those interested in the biological basis of eugenics no more important work has been published for many years than *The Mechanism of Mendelian Heredity*, by Prof. T. H. Morgan, of Columbia, and others (New York). Recent translations of Binet's *The Development of Intelligence in Children* and *The Intelligence of the Feeble-Minded*, published by the Training-School at Vineland, N. J., should not be overlooked by those who desire to understand something of the psychological phases of the problems of eugenics. Two new periodicals were founded: *The Eugenic News*, the first issue of which appeared in January, 1916, under the imprint of the Eugenics Record Office, Cold Spring Harbor, L. I., and *Genetics*, published bi-monthly by the Princeton University Press. See NATIONAL BIRTH CONTROL LEAGUE; ZOÖLOGY, *Heredity*.

**EUROPEAN WAR.** See WAR OF THE NATIONS.

**EVANGELICAL ASSOCIATION.** A religious denomination principally composed of German-born citizens of the United States. Its doctrines are practically the same as those of the Methodists, and its communicants belong to nearly all parts of the northern section of the United States and Canada. There are also many to be found in the West and South. The missionary work of the Association is carried on chiefly among the Italian immigrants. In 1916 the denomination had 115,243 communicants, 1663 churches, and 1031 ministers. The Church is divided for administrative purposes into 24 districts, has over 175,000 pupils in the Sunday schools, and a Young People's Alliance whose membership numbers over 50,000. A preaching house is maintained in Cleveland, O., and there are several philanthropic institutions and hospitals in Chicago, Philadelphia, and cities throughout the Middle West. Northwestern College, Naperville, Ill., is the leading educational institution.

The United Evangelical Church is a denomination of the same doctrinal beliefs and polity as the Evangelical Association. In 1916 it had a total membership of 89,920, being an increase of 3029 over 1915, 516 itinerant preachers, 221 local preachers, 948 organized congregations, 920 churches, and 950 Sunday schools. The total value of church property in 1916 was \$5,699,129. Its Sunday schools had 14,055 officers and teachers, 123,194 scholars, and, with home department and cradle roll, a total enrollment of 152,220. The Young People's Societies of the denomination were in a flourishing condition in 1916. The missionary work, both home and foreign, was successful. There were 307 home missions in operation in 1916, an increase of four over 1915, and these missions had a church membership of 35,425, and a Sunday school enrollment of 61,240. The missionary work in China in 1916 was vigorously prosecuted, and a theological school was opened at Hunan. The leading educational institutions are Albright College, Western Union College, the Bible Teachers' Training School, New York City, the Oregon Bible Training School, and the Illinois Training School for Christian Workers. The publishing house is at Harrisburg, Pa.

**EVOLUTION.** See ZOÖLOGY, *Evolution*.

**EXHIBITIONS, ART.** See PAINTING AND SCULPTURE.

**EXPERIMENTAL PSYCHOLOGY.** See PSYCHOLOGY.

**EXPERIMENT STATIONS.** See AGRICULTURAL EXPERIMENT STATIONS; HORTICULTURE.

**EXPLORATION.** (For Arctic and Antarctic exploration see POLAR RESEARCH.) Progress in perfecting the knowledge of the unexplored regions and of the resources of the earth has been seriously retarded through the great European war. Although the field for original exploration of uninhabited and unknown areas is still vast in extent, yet the tendency steadily grows to devote more and more energy to the solution of geographical problems of marked human interest, along economical, historical, and scientific lines. The most important geographical field work of the year 1916 has been accomplished in South America by Farrabee, in Asia by Stein, in the Antarctic regions by Shackelton, and in the Arctic regions by Rasmussen and Stefansson.

**AFRICA.** Except in connection with military movements, exploration and research have ceased on this continent. However, surveys were made through some unexplored areas in the construction for war use of the British railway from Voi to the northern terminus of the German railway system at Moshi, under the very shadow of snow-capped Kilimanjaro.

**NORTH AMERICA.** (See ALASKA.) It will be a matter of surprise to many to learn that more than one quarter of the Dominion of Canada is as yet unexplored, the greater portion being in western regions. In an effort to ascend Mt. Kitchi, Miss M. L. Jobe in a journey via Jarvis Pass to Mt. Ida and the headwaters of the Wapiti River, traversed in part unmapped territory. The most extended researches, south of Dr. Anderson's work on the Arctic coast in conjunction with Stefansson, are those of Mr. Christian Leden, who reports that in three years (1913-16) he made important ethnological studies of practically unknown tribes in the unexplored regions to the west and north of Hudson Bay. These natives inhabit the country between Dawson Inlet and Reindeer Lake, Dawson Inlet and Ferguson River, around Southampton Inlet, west of Rankin Inlet, and between Chesterfield Inlet and Repulse Bay. Leden's studies are said to cover the history, religion, habits, and domestic life of the natives.

**SOUTH AMERICA.** Only 1 per cent of the area of Brazil is mapped on a standard scale, principally in the state of São Paulo: this condition is indicative of the amount of territory as yet unknown. Important results, geographically and scientifically, were obtained by the expedition of the University of Pennsylvania Museum, under Dr. W. C. Farrabee, which was equipped principally for ethnographic research. The region visited was in the north-central watershed of the Amazon—principally in the borderland of the Guianas—Brazilian and British. Ten tribes, of the Arwak and the Carib stock, were systematically studied: several had never been visited in their villages and so were new to exploration and to science. These tribes were the Chikena, Diau, Katauiana, Kuma, Kena, Mapidian, Parikutu, Toneyan, Urukua, Waiwai, and Waiwe. Farrabee discovered and visited the central village of the Mundurucus—never before located. It is situated in the un-

explored country between the Tapajos and Xingu rivers, which proved to be a hilly, semi-desert region instead of an elevated plateau, as before surmised. The most important geographic work covered the country between the upper Essequibo and the Corentyne, of British Guiana. Farrabee discovered the sources of the Corentyne and by his astronomical observations, during his descent to the mouth, was able to correct many previous errors in the charts. Other Brazilian explorations were made by Lieut. Marquez de Souza, who was killed while surveying the unknown Ananas River, which proved to be the Cardozo River of Roosevelt's explorations.

**ASIA.** In keeping with Stein's researches have been the discoveries of Dr. C. W. Bishop, at the head of the eastern Asiatic expedition of the University of Pennsylvania, in extreme Western Szechwan, China. In the country near Kiatingfu, at the junction of the Min and Ya rivers, he found many burial caves, elaborately carved out of the sandstone cliffs and often decorated. This form of burial was that of the aborigines of this region prior to its invasion and occupation by the Chinese. With the bodies were deposited clay images of relatives and of tutelary deities in the stone or earthenware coffins.

Sir Aurel Stein in his third journey (1913-16) completed the re-discoveries of ancient centres of Asiatic culture and civilization—Buddhist, Chinese, and Hellenistic. Subsequent to his exploration of the Oxus Basin (see YEAR BOOK, 1915), by a journey of 1700 miles on foot and horseback, Stein explored (October, 1915-March, 1916) the borderland of Persia-Afghanistan, following closely the 60th meridian of east longitude from Ashkhabad to Koh-i Malik Siah, and thence due east to Quetta. On the rocky isolated hill of Koh-i Kwaja, in Seisan Province, was discovered the ruins of a large Buddhist sanctuary, the first ever located on Iranian soil. Its pictorial ornamentation includes remarkable frescoes of the Sassanian period, as well as paintings distinctly Hellenistic in style. Both in ornaments and in architecture were jointly reflected Greek and Oriental art as affected by Buddhist forms. On the Helmand Desert was found a line of watch-stations, dating about the beginning of the Christian era, extending from southernmost Hamun towards the lake-bed of Gaud-i-Zirreh. Solidly built on a uniform plan, they evidently served to protect cultivated Helmand delta from raids of nomads in the south. Among archaeological objects were stone implements of the neolithic period, articles of the bronze age, and prehistoric pottery with early Aramaic characters.

**EUROPE.** The war has dominated European activities. Among the few explorations incident to the war may be mentioned that of the comparatively unknown Turkish Island of Imbros, the nearest isle to the Dardanelles. Its geographic study and description are due to Mr. Ogilvie in connection with his geographic war service.

**MISCELLANEOUS.** Explorations, largely ethnographical, have been made in Central Borneo by Carl Lumholz. After researches on the southwest coast he entered the valley of the Busan, a branch of the Barito, where the native tribes were studied. Later he ascended the Barito to its source and, crossing a divide of

1400 feet, came to a region where the Dyaks, some 10,000 in number, were living under aboriginal conditions, uninfluenced by civilization. Traveling eastward, he struck the Kaso, and following it to its junction with the Mahakam, descended the latter river to Samarinda, on the east coast. Altogether Lumholz voyaged on these practically unknown streams more than 1000 miles in native boats.

Dr. Bauer reports that the voyages of the *Carnegie* (of the Carnegie Institution), in its ocean-wide magnetic surveys, were especially remarkable during 1916. Arriving from Dutch Harbor, Alaska, at Lyttelton, N. Z., she commenced her voyage of circumnavigation on Dec. 6, 1915, which closely followed the 60th parallel of south latitude, touching the South Georgia Islands. The *Carnegie* returned to Lyttelton April 1, 1916, having made a voyage of 17,804 nautical miles under sail in 118 days. This circumnavigation of the sub-antarctic regions is believed to be the first ever made in a single season. The non-existence of Dougherty Island was determined during this cruise, and an approach to within 40 miles of the assigned position of Nimrod Island, without any signs of land being seen, very probably eliminates this island from future charts.

Dr. Thurnwald explored the northern part of New Guinea around the sources of the Sepik River, and thence to the north coast.

**EXPLOSIONS.** See FIRE PROTECTION; NAVAL PROGRESS; UNITED STATES AND THE WAR.

**EXPLOSIVES.** See CHEMISTRY, INDUSTRIAL.

**EXPORTS.** See FINANCIAL REVIEW.

**EXPOSITIONS.** During the year the only exposition of importance in the United States was the one held in San Diego, Cal. There was also one held in the city of Panama.

**PANAMA-CALIFORNIA EXPOSITION.** This exposition which was held in San Diego, Cal., was officially closed on Dec. 31, 1915, but it was opened again on March 18th, with formal ceremonies and continued until the end of the year. In addition to the exhibits already installed, important foreign exhibits were transferred from the Panama-Pacific Exposition held in San Francisco. These gave it an international character and included the Austrian, Canadian, Dutch, French, German, Italian, Russian, Spanish, and Swiss exhibits. Additional exhibits of the California counties were secured, as well as a number of attractions for the "Zone," as the amusement section was called. Also a large portion of the government exhibits were transferred to San Diego from San Francisco.

**PANAMA-PACIFIC EXPOSITION.** The final certified statements of the revenues of the exposition, issued in March, gave the grand total of receipts for admissions and concessions as \$12,524,090. Paid admissions amounted to \$4,715,523 and the gross receipts from concessions were \$7,809,565. The net revenues from concessions were \$1,830,331. The total admissions were 18,756,148. Part of the site of the Panama-Pacific Exposition, on the edge of San Francisco Bay, was purchased in November by the Exposition Company for \$184,000, as the first definite step toward preserving and presenting the famous Exposition Marina and the Palace of Fine Arts to the city of San Francisco.

**PANAMA NATIONAL EXPOSITION.** The only foreign exposition during the year was held

in the city of Panama and had for its objects the celebration of the discovery of the Pacific Ocean by Balboa, and the strengthening of the bonds of friendship and sympathy that unite Panama and other republics of the New World, thus promoting commercial and intellectual interchange between these nations. It had its inception in 1912 and was to have been inaugurated in 1913, but for various reasons, including the great war and the greater expositions in San Francisco and San Diego, it was not opened until Feb. 6, 1916, and then ran for 100 days. A site covering over 50 acres, called "El Hatillo," just north of the city on the shore road to old Panama and less than half a mile from the railroad, was selected. The grounds rose in a gentle slope from the bay, a fine view of which and of the ocean beyond was obtained from the central promenade of the exposition. Arranged in squares about a large central plaza were the seven principal structures of the exposition. These were the Hall of Fine Arts, the Education, Commerce, Agricultural and Horticultural, and Administration buildings, and the fine permanent edifices of Spain and Cuba. The two last, named after the exposition, became the permanent homes of the legations of the two countries and the other permanent buildings were transformed into government offices. There were also a number of smaller buildings. The most important features of the exposition were the exhibits of the natural resources of Panama. These included a splendid series of specimens, showing the diversified flora and fauna of the country, and also the forestal wealth shown by many varieties of fine timber and cabinet woods. In addition to the United States, exhibits were made by Spain, Cuba, Ecuador, and Guatemala. The United States sent its government exhibit from San Francisco at the close of the Panama-Pacific Exposition, and it was described as "the most comprehensive exhibition the United States government has ever sent to a foreign country." Certain days were set apart in honor of the participating nations, and on February 22nd, "United States Day" was celebrated with appropriate exercises. At the close of the exposition on June 1st, it was found that the receipts had been sufficient to pay for the grounds, the erection of the buildings, the landscape gardening, and all salaries. The director-general was James Zetek, and the United States commissioner, William E. Tuttle, Jr.

**MINOR EXPOSITIONS.** There were held during the year the usual number of minor expositions both at home and abroad. Among them may be mentioned the following: There was an Industrial Exposition held in Dayton, Ohio, during January 14th-22nd. Brazil's first Fruit Exposition was held in Rio de Janeiro during January 30th-February 7th. A government Safety First Exposition was held in Washington, D. C., during February 21st-26th. The second annual British Industries Fair was held in the Victoria and Albert Museum in London during February 21st-March 3rd. The second annual Sample Fair was held in Lyons, France, during March 1st-15th. The usual fairs were held in Leipsic, Germany, the first called the Jubilate, beginning on March 6th, and the second called the Michaelmas, beginning on August 28th. The third annual exhibition of Siamese agriculture, industry, and commerce was held in Pitsanuloke, Siam,

beginning April 8th. An industrial exhibition was held in Taiwan, Formosa, during April 10th-May 9th. Its object was to show the progress made in Formosa during the 20 years the island has been a Japanese possession, and the revolution in commerce and trade resulting therefrom. A unique exposition of "The Reconstructed City" was held in Paris, France, for three months, beginning on May 15th. The United States was the only foreign nation admitted to participation in this exposition. The second Canadian Toy Fair was held in Toronto, Canada, during August 26th-September 11th. An industrial exposition was held in Santiago, Chile, during September 15th-November 15th.

**COMING EXPOSITIONS.** In the United States, a Mississippi Centennial Exposition will be held in Gulfport, Miss., from October, 1917, to April, 1918, to commemorate the 100th anniversary of the admission of Mississippi as a State to the Union. Ground was broken for the exposition with suitable ceremonies on Oct. 13, 1916. Also a bill authorizing the transfer of the government exhibits from San Diego, Cal., to Gulfport was introduced in Congress. The 200th anniversary of the founding of San Antonio will be celebrated in 1918 by a Texas Bicentennial and Pan American Exposition, to which Congress has authorized the President to invite the participation of Spain and the Latin American countries. The Pilgrim Tercentenary Commission of Massachusetts has reported in favor of celebrating the 300th anniversary of the landing of the Pilgrims at Plymouth by an international exhibition "which would bring together and especially emphasize the great achievements in science, religion, education, philosophy, music, and all other arts of the past 300 years. The commission also recommended the erection of a permanent memorial, the removal of the canopy from Plymouth Rock, and the lowering of the rock to its original bed.

Among the coming expositions abroad is the Hispano-American Exposition to be held in Seville, Spain, after the great war. This exposition, originally proposed to be held in 1914, is now well under way. An international Exposition of Electrical Industries, to be held in Barcelona, Spain, is planned for 1917. A British Empire Fair to be held in London, England, designed to show the development and products of every known industry in the empire, is announced for early in 1917. See **CELEBRATIONS**.

**FACTORIES.** See **ARCHITECTURE**.

**FAGUET, EMILE.** A French man of letters, died in Paris June 7, 1916. He was born in 1847 at La Roche-sur-Yon, received his education in lycées and at the Ecole Normale Supérieure, and afterward taught outside Paris till 1890, when he became professor of poetry at the Sorbonne. M. Faguet had early become a contributor to reviews on social, political, and literary subjects, and he gained such a reputation that the editorship of several of these was offered him. In 1901 he was elected to the French Academy. His books, devoted largely to literary and political history and criticism, are important for their scholarly character and for the unprejudiced point of view maintained. Faguet is rightly regarded as a constructive critic. Among the most important titles are *Politiques et moralistes du XIX<sup>e</sup> siècle* (three series, 1891-99) and *Histoire de la littérature française* (four vols., 1885-93). Writings

showing Faguet's great interest in the drama are: *La tragédie française au XVI<sup>e</sup> siècle* (1883); *Le théâtre contemporain* (1888-90), a collection of dramatic criticisms; *Drame ancien, drame moderne* (1898); *Propos de théâtre* (1903-10). English translations of his *Initiation into Literature* and *Initiation into Philosophy* appeared in 1914.

**FAILURES.** See **FINANCIAL REVIEW**.

**FALKLAND ISLANDS** (the *Islas Malvinas* of the Spaniards). A British colony composed of a group of islands in the South Atlantic. They are East Falkland (3000 square miles), West Falkland (2300), and about 100 smaller islands (totaling about 1200 square miles). South Georgia, a group of islands, 54½° S., with an area of about 1000 square miles, a great whaling station, is a dependency of the Falkland Islands. Inclusive of South Georgia the population numbered in 1911, 3275 (2370 males and 905 females). Estimated population, Dec. 31, 1913, 3223. Sheep farming is the sole industry of the colony. Hides, skins, horns, hoofs, bones, tallow, wool, and guano are the exports. Imports and exports for 1914 were valued at £233,379 and £1,505,464 respectively. Total tonnage entered and cleared, 518,144. Revenue, 1914, £2,932; expenditure, £36,046. There is no public debt. The only town is Stanley, with about 950 inhabitants. Dependencies besides South Georgia are the South Shetlands, Graham's Land, the South Orkneys, and the Sandwich group.

**FEDERAL AID ROADS.** See **ROADS AND PAVEMENTS**.

**FEDERAL CAPITAL TERRITORY.** A territory of the Commonwealth of Australia, situated within the State of New South Wales. The area is 912 square miles. The 1911 census showed a population of 1714 (992 males, 722 females); estimate of June 30, 1915, 2738. The territory was acquired from New South Wales in 1910 as the site of the permanent federal capital, which is named Canberra. The expenditure for development up to June 30, 1914, was £477,943. The great European war caused the work to be delayed, and the architectural competition for the federal parliamentary buildings was withdrawn until a more favorable opportunity.

**FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA.**

The council officially unites in its activities 30 Protestant denominations, including 140,000 churches, with about 18,000,000 members. Its purpose is to unify the work of the Protestant churches in coöperation. It is authorized to voice the conscience of the Protestant churches on important matters and, within proper limitations, to act for them, without, however, interfering with their autonomy. Its national of-

fers constitutes a general Protestant headquarters and clearing house.

The lines of activity are indicated by the names of the commissions, which consist of about 100 members each, nominated by the 30 constituent bodies as follows: The Commission on the Church and Social Service, for action upon social questions in the light of Christian principles; Commission on Evangelism, for united evangelistic work regulated by the churches; Commission on the Church and Country Life, for the conservation and development of rural churches; Commission on International Justice and Goodwill and Commission on Relations with the Orient, cooperating with the World Alliance for Promoting International Friendship through the churches, for the purpose of influencing international relations by the application of Christian principles; Commission on Christian Education, for bringing into cooperation all the educational boards of the churches for the consideration of such common matters as religious instruction in connection with the public schools; Commission on Temperance; and also special committees on Foreign Missions and on Family Life and Religious Rest Day.

The Home Missions Council brings together the various home mission boards in the interest of effective distribution of missions and churches, and the Commission on Inter-Church Federations is engaged constantly in organizing federations of churches in local communities.

In addition to the work of these commissions during the year 1916, important special movements, including a campaign for the conservation of human life, the institution of temperance work among workingmen, a nation-wide movement for war relief and financial assistance for suffering churches in France and Belgium, were carried on. In the interest of temperance, the council's commission has united with the historic National Temperance Society for an educational campaign, publishing three temperance periodicals. The council maintains a publication department which, during 1916, published and sent out over a million books and pamphlets relating to the unified work of the churches in the council. The various YEAR BOOKS issued contain complete ecclesiastical information and statistics.

The quadrennial meeting was held at St. Louis in December, bringing together 400 official representatives of the 30 denominations, which reviewed reports of the secretaries and commissions amounting to six volumes. Messages were received from the churches in the belligerent countries to which appropriate response was made by cable and wireless. The council maintains a staff, in addition to the general secretary, Rev. Charles S. Macfarland, consisting of seven field and executive secretaries. The national office is in New York, and an office is also maintained in Washington and in several other cities.

Railway lines in operation (1914), 771 miles, including 37 miles opened in 1913. The Railways Administration controls the line in the Malay Peninsula, including the Johore State Railways, leased since January, 1912.

Tin and rubber are the chief products for export. In the production of tin the Federated Malay States stand first among the countries of the world. A high commissioner administers the protectorate.

**FEDERATION OF CATHOLIC SOCIETIES, AMERICAN.** See ROMAN CATHOLIC CHURCH.

**FEDERATION OF LABOR, AMERICAN.** See LABOR, AMERICAN FEDERATION OF.

**FEMINISM.** See WOMAN SUFFRAGE; WOMEN IN INDUSTRY.

**FENCING.** The twenty-third annual intercollegiate fencing tournament was won by the United States Naval Academy for the second year in succession. Yale was second and Columbia third. The Navy was victorious in 36 matches, losing only 9. Yale won 28 and lost 17. The standing of the other teams was: Columbia won 23, lost 22; Cornell won 19, lost 26; Harvard won 18, lost 27; Pennsylvania won 10, lost 35. The individual winners were: foils, L. Mouquin, Columbia; sabres, C. De V. Headlee, United States Naval Academy.

Dual college competitions resulted as follows: Navy, 8, Harvard, 1; Navy, 8, Cornell, 1; Pennsylvania, 5, Harvard, 4; Yale, 5, Harvard, 4; Yale, 9, Springfield Y. M. C. A. College, 0.

In the national championships held by the Amateur Fencers' League of America, A. E. Sauer of the Illinois A. C. won with the foils and Sherman Hall of the New York A. C. with the sabres. The women's championship with the foils was captured by Mrs. C. H. Voorhees of the New York Fencers' Club.

**FERGUSON, JAMES E.** Reflected Democratic Governor of Texas, Nov. 7, 1916.

**FERGUSON, SAMUEL DAVID.** An American Protestant Episcopal bishop, and the first negro bishop of his church, died in Monrovia, Liberia, West Africa, Aug. 3, 1916. He was born at Charleston, S. C., in 1842, but when six years old was taken by his parents to Liberia. There he received an education in the mission schools, and after being appointed a teacher, began to study for the ministry. In 1865 he became a Protestant Episcopal deacon, and in 1868, priest. By 1884 he had become so well known for effective service that he was elected by the House of Bishops, sitting in

New York, missionary bishop of Cape Palmas and its adjacent territory. The diocese was later known as that of Liberia and West Africa. In 1885, the year of his consecration in Grace Church, New York, Bishop Ferguson received the degree of D.D. from Kenyon College, and in 1893 the degree of D.C.L. from Liberia College. His tact when attending the Episcopal tercentennial celebration in Richmond, Va., saved him from arousing Southern race prejudice; although Bishop Potter was bitterly criticised for inviting Bishop Ferguson to dine with him at that time.

**FERMENTED LIQUORS.** See LIQUORS.

**FERNALD, BEET M.** Elected Republican United States Senator from Maine, Sept. 11, 1916.

**FERNÁNDEZ DE BÉTHENCOURT, FRANCISCO.** See SPANISH LITERATURE.

**FERRO ALLOYS.** See METALLURGY.

**FERTILIZERS.** At the beginning of the year 1916 the fertilizer situation was distinctly bad from the farmer's standpoint. There was a shortage of supply of the principal fertilizing materials, nitrate of soda, acid phosphate, and especially potash salts, and the prices of these and most other materials as well as the mixed fertilizers prepared from them were as a rule abnormally high.

**POTASH.** There was no improvement during the year as regards the supply of potash for fertilizing purposes. Potash salts could not be secured at prices warranting their use in agriculture, although there was a sharp decline in the price of muriate and sulphate of potash in the New York market during the year. Fewer brands of mixed fertilizers contained any potash and the percentage was very small (usually not more than 1 per cent) in those which contained it. Nothing approaching complete statistics of the production and consumption of potash has been available since 1914, in which year the world's consumption was 8,225,253 metric tons of pure potash, as compared with over 10,000,000 tons the previous year. Of the potash consumed in 1914, 6,569,374 tons were used in Europe and 1,577,867 tons were used in America, the greater part, 1,524,992 tons, in the United States. Attempts were made to meet the shortage of potash by methods of soil management which draw upon the reserves or accumulated potash in the soil and by careful utilization of all waste and other materials containing appreciable amounts of potash. Efforts to develop a domestic potash supply in the United States were continued and progress was made in the production of potash from alunite and Pacific kelps. Eight plants, varying in cost from \$50,000 to \$2,000,000, are reported to have been engaged in extracting potash from kelp in southern California during the year, with a total daily harvesting capacity of 2500 tons of wet kelp. These plants are engaged in the extraction of potash without any regard to the by-products. With present prices this is considered profitable, but might not be under normal conditions. In anticipation of a return to such conditions the United States Congress has appropriated \$175,000 to the Department of Agriculture for experiments to demonstrate the commercial and economic feasibility of producing potash as well as useful by-products from kelp, and it is proposed to establish a plant

capable of handling at least 200 tons of raw kelp per day on the coast of southern California. Improvements of methods of preparing soluble potash salts from feldspar, by which it is claimed muriate of potash of good quality can be made at a reasonable cost, were reported during the year, as were also significant experiments by G. André in France, which showed that about 10 per cent of the potash of glauconite was rendered soluble by prolonged grinding in water with the addition of ammonium sulphate, over 7 per cent with sodium nitrate, and over 5½ per cent with calcium carbonate, sodium chlorid, and calcium sulphate. Simply grinding in water rendered 3.24 per cent of the potash soluble. Somewhat lower figures were obtained in the case of feldspar. In line with the policy of recovering potash from by-products or waste products, electrical devices were successfully installed in several cement works for extracting potash from fumes. A similar method was tested in a large iron and steel works.

**NITROGEN.** The output of nitrate of soda began to increase during the last half of 1915 and in 1916 reached a condition more nearly approaching the normal than has been the case since the European war began. The increased output, however, was used mainly for industrial purposes, and prices rose in all countries except the United States. Here the price remained practically constant during the first half of the year. The production during this period was 1,488,792 metric tons, as compared with 587,876 tons for the corresponding period of 1915. The stocks on hand in Chilean ports June 30, 1916, were 919,102 tons, nearly 100,000 tons more than at the corresponding date in 1915. The imports of the United States during the first half of 1916 amounted to 631,854 tons, more than three-fourths of the total output for 1915. European and Egyptian imports were 776,169 tons for the first half of 1916, as compared with 891,126 tons for the whole of 1915. Imports of certain countries fell off; for example, Russia imported less than during the previous year, and this mainly for industrial purposes, ammonium sulphate being substituted to a considerable extent for the nitrate for agricultural purposes. In Germany the Chilean nitrate formerly used was replaced by ammonium sulphate and synthetic nitrogen compounds, the manufacture of which was so developed as to make that country apparently independent of the rest of the world for nitrogen compounds for both industrial and agricultural purposes. While complete statistics of ammonium sulphate production during the year are not available, the indications are that it materially increased although prices steadily rose. In view of the uncertainty as to a sufficiency of the supply for domestic purposes Great Britain suspended export of ammonium sulphate during the year. From the limited data available it appears that the quantity of synthetic nitrogen compounds available for agriculture was considerably reduced in 1916, due either to reduction of output, as in Norway, or to the reservation of the output for other purposes than agriculture, as in France and Italy. In the National Defense Bill approved June 3, 1916, the United States Congress appropriated \$20,000,000 for the establishment of a plant for the manufacture

under government ownership and control of nitrogen compounds for use in the making of munitions of war, fertilizers, and other useful products. Search for natural deposits of nitrates in the United States was continued, with disappointing results.

**PHOSPHORIC ACID.** No statistics of the output of phosphates in Europe in 1915 and 1916 are available. The output of the United States in 1915 was 1,865,124 metric tons. This represents a decided falling off, which continued into 1916. The Algerian output during the first six months of 1916 was 162,837 tons, as compared with a total output of 165,433 tons in 1915. The Tunisian output for the first three months of 1916 was 224,345 tons, not materially different from that for the same period of 1915. The total output of Tunis in 1915 was 1,389,074 tons. Prices for raw phosphate remained quite constant in the United States and England, but increased decidedly in many other countries. There was a slight falling off in the production and increase in the price of superphosphate, due to increased cost of mining and transporting the raw phosphates and the higher price of the sulphuric acid used in their manufacture.

**MANURE.** The shortage and high price of other fertilizers is emphasizing the value of barnyard manure and the importance of conserving and using to good advantage this great farm resource. It is being valued now as never before as a carrier of plant food, especially potash and nitrogen. Its preservation, economical use, and intelligent supplementing with commercial fertilizers and green manures are now receiving special attention. This is particularly important in view of the fact that the supply of manure is not keeping pace with the demand for it.

**PEAT.** The necessities of the present agricultural situation have also accentuated interest in the utilization of peat as a fertilizer and have drawn attention especially to means of increasing its value as a source of nitrogen. Many experiments with so-called "bacterized peat" were reported during the past year. The essential features of the process by which this material is prepared are (1) treatment with a culture of so-called "humating" bacteria and incubation at a constant temperature for a week or 10 days to produce soluble humates to serve as food for the nitrogen-fixing organisms, (2) destruction of the humating bacteria by sterilization with live steam, (3) treatment of the sterilized peat with a mixed culture of nitrogen-fixing organisms and incubation at 20° C. for a few days, after which the material is ready for use. Analyses indicate that the amount and availability of the nitrogen is decidedly increased by this process, although the composition appears to be quite variable. The material has been shown to have considerable fertilizing value. Its practical value, however, will depend upon whether it can be produced at a sufficiently low price to compete with other similar fertilizing materials.

**GENERAL.** The great lesson of the present fertilizer situation is that the conservation of soil fertility and the utilization of all available fertilizer resources are fundamental duties, and that all the resources of science and of successful practice should be brought to bear

upon this problem. To this end it was suggested, as an outcome of a conference in 1916 of directors of experiment stations in the Northeastern States, that farmers should give greater care than ever before to (1) the selection of soils for crops; (2) the management of soils so as to utilize to the fullest possible extent the plant-food supplies already in the soil; (3) the conservation and utilization of all sources of plant-foods produced on the farm; (4) the selection of such commercial plant-food materials as are most economical; (5) careful study of the plant-food needs of different crops; (6) precautions to be observed in purchasing fertilizers." That a high level of production can be maintained with a scientific use of fertilizers is abundantly proved in the case of Germany, the chief immediate cause of whose increased agricultural productivity, especially in recent years, is the increase in use of artificial fertilizers scientifically applied. Impressed by this fact, the British Board of Agriculture has strongly urged a similar policy of liberal but discriminating use of fertilizers. In the United States a prominent and successful feature of the agricultural extension work is a campaign to bring about more effective and economical use of fertilizers. See **CHEMISTRY, INDUSTRIAL; SOILS.**

**FESTIVALS, MUSIC.** See **MUSIC.**

**FICTION.** See articles on French, German, Italian, Russian, Scandinavian, and Spanish literatures; **LITERATURE, ENGLISH AND AMERICAN.**

**FIJI ISLANDS.** A group of South Pacific islands; a British crown colony. Total area, including the dependency of Rotumah (14), is 7435 square miles. Estimated population, Dec. 31, 1913, 153,704. Sugar, copra, and fruit (particularly pineapples) are the chief products and exports. Total imports, 1914, £911,274; exports, £1,389,565. Suva, the capital, has cable communication with Brisbane and with Canada. Revenue, 1914, £279,845; expenditure, £301,352. Public debt, £60,715.

**FILTRATION.** See **WATER WORKS AND WATER PURIFICATION.**

**FINANCIAL REVIEW.** This topic includes a statement of the general features of business conditions during the year, together with a treatment of such special topics as stock exchange, foreign trade, bank clearings, failures, and business conditions in particular countries. Additional information relating to trade and finance will be found under the following topics: **AGRICULTURAL CREDIT, BANKS AND BANKING, INSURANCE, NATIONAL BANKS, PRICES, TARIFF, TAXATION, TRUSTS.** See also the article **LABOR** and references there given, articles on various countries and States of the United States.

**GENERAL CONDITIONS.** Although the preceding year had been one of superlative business developments in the United States, Canada, and Japan, it was surpassed by the industrial and trade activity of 1916. This was in part due to foreign demand due to the war, although estimates of the proportion of American business due to the war ranged from 50 per cent down to 10 per cent. The year opened with all lines of business running at nearly full capacity; there was a slackening of demands and slight unsettlement during the summer, but this was followed by renewed activity on an enlarged scale in the fall and

early winter. The statistics given in the following paragraph indicate some of the year's achievements. The volume of exports was one of the most astonishing results of the year's trade, but imports also reached an amount hitherto unattained, in spite of the fact that several countries with which American trade had, before the war, been extensive, were practically excluded from our markets. The volume of domestic trade likewise reached, according to an estimate in the *New York Times Annalist*, the prodigious sum of \$45,000,000,000, as compared with \$32,000,000,000 in 1915 and \$30,000,000,000 in 1914. In consequence the railway embargoes which had been instituted late in 1915 were again imposed at various times with restriction of production in various industries. During the early months of the year the car shortage was not serious and on August 1st there was a small surplus of 9700 freight cars out of the country's total of 2,000,000; but on September 1st the shortage was 19,800; it had risen on October 1st to 60,700; while on November 1st it was 108,000. A favorable factor as regards foreign trade, however, was the reduction in ocean freight rates and the availability of greater tonnage. Reduction in these rates amounted from 40 to 50 per cent toward the close of the year. In some cases there was a shortage of materials, while in many places all available labor was utilized and more was demanded at advancing wages. (See UNEMPLOYMENT.) Prices of materials generally advanced. (See PRICES.) Enormous gold importations were at the basis of this rapid upward movement of prices and a great expansion of bank credits. During 1915 the stock markets had absorbed about \$1,000,000,000 of American securities previously held abroad, and American banking institutions and investors had extended through bonds and notes credits of an equal amount to foreign governments; these remarkable phenomena were repeated in 1916. These transactions were, however, merely an indication of the enormous volume of investment transactions. Stock speculation for the year was surpassed only in 1906, while bond sales were exceeded only in 1909. Commercial failures were relatively few and liabilities relatively small. Bank clearings reflecting the unparalleled volume of domestic trade greatly exceeded those of any preceding year.

**STATISTICS.** The agricultural crops were somewhat smaller in amount than in 1915, but nevertheless, on account of the unusual world demand, represented a greater value. The total value of all farm products was finally estimated at a gross value of \$13,449,000,000, exceeding the total value in 1915 by \$2,674,000,000, and that of 1914 by \$3,500,000,000. This value was double that of 1905. Iron ore mined totaled 75,500,000 tons, or 20,000,000 tons more than in 1915. Coal mined aggregated 597,500,000 tons; coke produced, 54,300,000 tons; pig iron production was 39,500,000 tons, or nearly 10,000,000 tons greater than in 1915 and exceeded the previous maximum of 1913 by 8,600,000 tons. Of copper approximately 2,300,000,000 pounds were produced, being an increase of 41 per cent over the preceding year. The gross earnings of railways aggregated \$3,753,000,000, an increase of 18 per cent over 1915; their net earnings, \$1,136,

000,000, an increase of 26 per cent. Building expenditures for the year were estimated by *Bradstreet's* at \$1,000,000,000, or 10 per cent greater than in 1915. The unfilled orders of the United States Steel Corporation at the close of the year were 11,058,000 tons, an increase of 35 per cent, as compared with 1915. Petroleum production amounted to 292,300,000 barrels, an increase of 4 per cent. There were built 135,000 freight cars and 4075 locomotives, increases respectively of 82 per cent and 95 per cent. Railway receiverships decreased from the previous year 80 per cent in mileage and in capital involved; but railway foreclosure sales increased 114 per cent in mileage and 146 per cent in capital involved. It was estimated that the tonnage built in American ship yards in the first 11 months was 522,000, an increase of 114 per cent, while a similar percentage increase was represented by the 1,500,000 automobiles estimated to have been built. The labor employed in the cotton industry was approximately the same in November, 1916, as in January, 1915, but the payroll had increased 17 per cent; for these same dates the woolen industry showed an increase of 17 per cent in number of employees and 44 per cent in payroll; boots and shoes an increase of 15 per cent in number of employees and 41 per cent in payroll; while iron and steel showed an increase of 58 per cent in number of employees and 124 per cent in wages paid. The *Journal of Commerce* reported that the January, 1917, dividend and interest payments of American railway, traction, and industrial companies, and the Federal and New York City governments aggregated \$330,517,000, an increase of \$49,317,000 over January, 1916.

**STOCK OF GOLD.** On Jan. 1, 1917, the stock of gold money in the United States was approximately \$2,850,000,000, or \$27.60 per capita. There were gross imports during the year of 1916 amounting to \$680,000,000 and exports of \$150,000,000, or net imports of \$530,000,000, nearly \$6 per capita. The gross imports since July 1, 1914, totaled \$1,150,000,000; and net imports, \$855,000,000. The total stock of gold money in the United States, including the output of American mines, had increased from July 1, 1914, by nearly \$1,000,000,000, or at least \$9 per capita. This immense quantity of gold was believed to be a menace to American industrial and commercial peace. About two-thirds of it had been added to banking reserves and the remainder to free circulation. An abundant supply of gold prompts bankers to unduly expand credits, and it leads them to invest too freely in non-liquid securities. These tendencies were shown during 1916. But doubtless one of the most deplorable and far-reaching effects was an increase of prices during the year of about 28 per cent (see PRICES). Moreover, the inevitable exportation of gold at the conclusion of the war might easily produce startling reductions in credits and in prices.

**FOREIGN TRADE.** The total imports from abroad during 1916 were approximately \$2,350,000,000, an increase of 32 per cent over 1914 or 1915; total exports were \$5,475,000,000, an increase of 54 per cent over 1915 and of 159 per cent over 1914. The greatest volume of imports in any preceding calendar year had been \$1,818,000,000 in 1912, while the greatest

volume of exports previously had been in 1915. These results were attained in spite of the fact that trade with central European powers was only \$35,000,000, or 5 per cent of the normal amount; and in spite of a reduction of more than \$150,000,000 in the normal volume of purchases from the rest of Europe. The following statistics refer to the first 10 months. During this time our purchases from Canada, Cuba, and Mexico were \$170,000,000 above the pre-war average; those from South America were \$160,000,000 greater; those from Asia, \$200,000,000 greater; those from Oceania, \$40,000,000 greater; and those from Africa, \$40,000,000 greater. The principal items producing these increases were Cuban sugar, Canadian manufactures, South American coffee, cacao, rubber, wool, and hides, and Oriental silk, hides, rubber, and fibres. Crude manufacturing materials imported alone showed an increase of \$300,000,000, as compared with the first 10 months of 1914; partly manufactured foodstuffs showed an increase of \$70,000,000 for that period; and partly manufactured materials for use in further manufacture, an increase of \$100,000,000.

The exports were increased only in moderate proportion by the war exportations to Europe. Principal items of exports for the first 10 months were as follows, together with the percentage increase or decrease in comparison with 1915: brass, \$263,000,000, 592.0 per cent increase; wheat and flour, \$243,000,000, 26.5 per cent decrease; all breadstuffs, \$377,000,000, 18.2 per cent decrease; copper, \$188,000,000, 102.0 per cent decrease; cotton, \$395,000,000, 12.5 per cent increase; explosives, \$582,000,000, 430.0 per cent increase; iron and steel, \$701,000,000, 138.0 per cent increase; meat and dairy products, \$253,000,000, 9.0 per cent increase; horse and mule, \$74,000,000, 29.0 per cent decrease; automobile, \$100,000,000, 6.3 per cent increase; chemicals, etc., \$134,000,000, 120.0 per cent increase; coal, \$80,000,000, 9.5 per cent increase; cotton goods, \$107,000,000, 35.0 per cent increase; leather and manufactures, \$130,000,000, 3.8 per cent decrease; oil, mineral, \$171,000,000, 46.1 per cent increase. While exportations to Europe were most unusual, those to the rest of the world doubled during the two years 1915 and 1916. Great Britain alone purchased nearly \$2,000,000,000 worth of goods; France, about \$950,000,000; Canada, \$600,000,000; Russia, \$140,000,000; South America, \$197,000,000; and Cuba, \$145,000,000. Moreover, the proportion of exports represented by food products continued to diminish while the proportion represented by manufactures rapidly increased. It must be noted that an important factor in the tremendous increase in the value of imports and exports was the rapid rise of prices.

**STOCKS AND BONDS.** The transactions just mentioned, together with the great outburst of domestic trade, furnished an adequate basis for immense speculative and investment movements. Moreover, money was abundant, call loans seldom reaching 3 per cent and time loans being usually 4 per cent or less. Stock markets throughout the country reported unusual transactions and a very widespread participation of the public. At New York stock shares traded aggregated \$230,060,000, an amount exceeded only in 1906, and 32 per cent above the sales of 1915. Bond transactions totaled \$1,134,000,000, or 18 per cent above the 1915 total and not ap-

proached except in 1908 and 1909. There was uncertainty at the beginning of the year due to German submarines and the Mexican situation, with the result that the low ebb of the year was reached in April, when 50 leading stocks averaged 80.91. The great increase in reported earnings of railways and industrial companies brought improvement in the summer, and some advance in prices resulted from the decision of the British government to use their holdings as collateral rather than to sell them. Following the settlement of the railway difficulties in September, there occurred a very unusual stock market boom. This raised the prices of all stocks but greatest activity prevailed in American industrials and railroads, rather than in war stocks. Sixty-nine days of the year showed transactions in excess of 1,000,000 shares. On November 20th the above 50 stocks showed an average of 101.51, but sharp declines accompanied the warning of the Federal Reserve Board against foreign notes (see **BANKS AND BANKING**), Germany's peace proposal, and President Wilson's note of December 18th. In consequence these 50 stocks showed an average price of only 88.72 on December 29th.

**BANK CLEARINGS.** As was to be expected from the great volume of business, the bank clearings of the country reached an amount hitherto unattained. For the calendar year, clearings of 152 American centres aggregated \$259,965,000,000, an increase of 39 per cent over 1915, which was the previous maximum, and an increase of 68 per cent over 1914. Of this enormous aggregate New York City was credited with \$159,580,000,000, which was 44.7 per cent greater than the New York clearings of 1915, and 92 per cent greater than those of 1914. Outside of New York the aggregate was \$100,388,000,000, or 31 per cent more than in 1915 and 41 per cent more than in 1914. Every large city of the country reported an increase in the volume of bank clearings. The clearings for all cities by months, in millions of dollars, were as follows: January, \$20,011; February, \$18,185; March, \$20,618; April, \$19,251; May, \$20,564; June, \$20,526; July, \$19,307; August, \$19,685; September, \$22,677; October, \$25,491; November, \$26,610; December, \$27,075. The increases by different sections of the country, reflecting the increases in business transactions were as follows: New England, 30.3; Middle, 44.1; Western, 42.7; Northwestern, 25.1; Southwestern, 29.5; Southern, 28.1; Far-Western, 36.6. The total clearances in millions of dollars for principal cities other than New York were as follows: Chicago, \$20,541; Philadelphia, \$13,083; Boston, \$10,756; St. Louis, \$5370; Pittsburgh, \$3402; Kansas City, \$4953; San Francisco, \$3479; Baltimore, \$2206; Detroit, \$2260; Cincinnati, \$1747; Minneapolis, \$1469; Cleveland, \$2473; Los Angeles, \$1292; New Orleans, \$1381; Omaha, \$1279; Milwaukee, \$1947; and Atlanta, \$1013. In December for the first time total clearances outside of New York exceeded \$10,000,000,000.

*Canadian Clearances* likewise established a new record, with a total of \$10,315,000,000, an increase of 34.7 per cent over 1915 and of 30.4 per cent over 1914. Of the total, Montreal was credited with \$3,715,000,000, Toronto with \$2,571,000,000, and Winnipeg with \$2,061,000,000.

**FAILURES.** The year was one of such unprec-

edented industrial prosperity that failures were fewer than in 1915 and also in 1914. Not only was there a decrease in numbers, but there was an even greater decrease in liabilities. According to *Bradstreet's* the number of failures was 16,498, or 13.3 fewer than in 1915. Liabilities aggregated \$170,752,000, or 40 per cent less than in 1915, and the smallest in a decade, except in 1909. Every group of States except the Northwest, where there was a failure of the wheat crop, showed a decrease both in the number of failures and in liabilities. The proportion of assets to liabilities was only 48 per cent, being the smallest proportion since 1902. The business death rate was 0.91 per cent, as compared with 1.07 per cent in 1915 and 0.95 per cent in 1914.

*Canadian Failures* numbered 1772, with total liabilities of \$15,952,000 and total assets of \$6,349,000. In comparison with 1915, there was a decrease of 32 per cent in the number and of 50 per cent in the total liabilities.

**FOREIGN EXCHANGES.** The unprecedented volume of the foreign trade of the United States, Great Britain, and France and the unbalanced character of this trade created serious problems for bankers dealing with the settlement of international balances. The tremendous excess of American exports made it necessary for the first time that large credits be established in New York for Great Britain and France. In consequence, exchange on New York became a readily available medium of international trade throughout the world. This "dollar exchange" had become so important by the close of 1916 that international bankers found its volume to be approximately equal to the volume of sterling exchange. Thus New York temporarily tended to become an international banking centre of equal importance with London. As the United States became the greatest creditor nation in the world's trade it repurchased \$2,000,000,000 of American securities previously held abroad, increased its gold holdings to a prodigious sum, while in addition hundreds of millions of dollars of securities owned by British subjects and mobilized by the British government were on deposit in New York as security for extensive loans. These loans in fact were only a small proportion of the total loans extended to foreign governments, including those of Canada, Russia, France, French cities, Argentina, and China, by American investors during the year.

At the close of the year the principal exchanges showed the following percentage discounts at New York: Sterling, 2.2; francs, 12.6; marks, 24.1; kronen, 40.9; lire, 33.2; ruble, 41.3. There was a slight premium on Holland and Swiss exchange, as also upon Argentine exchange; but that upon Rio de Janeiro was at a discount of 26.2 per cent.

**BLACKLIST.** A war measure very directly affecting United States trade was the publication on July 18th of a blacklist of 82 American business firms and individuals by Great Britain. These were chiefly German firms with head offices in Germany, or German firms incorporated in the United States. But the scope and effect of the policy was unusual. Not only were financial and commercial dealings forbidden between citizens of Great Britain and the firms on the list, but Americans doing business in foreign countries received notice that their dealings with the blacklisted firms were to be regarded

as subject to veto by the British government. Moreover, from fear of consequences, neutral bankers refused loans to those on the list and neutral merchants declined to contract for their goods. British steamship companies would not accept cargoes from the proscribed firms or persons, or transport their goods to any port. Steamship lines of neutral ownership accepting freight from these firms were threatened with refusal to permit coaling at British ports, with exclusion from other privileges, and with probable addition to the blacklist themselves.

Protest in regard to this action of the British government was filed in London by Acting Secretary of State Frank L. Polk on July 27th. The protest, after reciting the above-noted consequences of the blacklist, maintained that citizens of the United States were entirely within their rights in trading with peoples or governments of any nation at war and were subject only to practices of international law; and that "neutrals may not be condemned nor their goods confiscated except upon fair adjudication and after an opportunity to be heard in prize courts." The note of protest concluded that the United States manifestly could not be expected to "acquiesce in such methods or applications of punishment to its citizens."

The reply of Sir Edward Grey to this protest, dated October 10th, was considered a most effective legal argument, but was not fully satisfactory to American opinion. He described the blacklist as "a piece of purely municipal legislation," that is, relating solely to internal government, and consequently applying only to British subjects. The purpose of the blacklist was to forbid such subjects from trading with the blacklisted persons, who in this case happened to be domiciled in the United States, but who were rendering service to the enemy. He gave assurance that the prohibitions would "not be carried further than is absolutely necessary," nor would it be permitted to interfere with genuinely neutral trade. At the same time Lord Grey defended the so-called "Bunker Coal Agreement." This related to a rule authorizing the supplying of coal in British ports only to ships agreeing not to carry goods belonging to blacklisted firms. The British note caused considerable offense by the assertion that "no adequate action has yet been taken by the Government of the United States to suppress criminal breaches of neutrality" by German-Americans. Newspaper comment was much divided on the soundness of Sir Edward Grey's defense of the blacklist, but there was general resentment to this affront to the American government.

**WAR AND FINANCE.** The war, of course, constituted the most important single element in the world's financial year. It was computed that the direct money cost of the war up to the close of 1916 was more than \$61,000,000,000 and that the expenditures were then occurring at the rate of \$105,000,000 per day. In this total the Entente Allies were charged with more than \$41,000,000,000, and the Central Powers with the remainder. The total cost to the different Allies up to the close of 1916 was approximately as follows: United Kingdom, \$14,374,000,000; Canada, \$400,000,000; other British colonies, \$600,000,000; France, \$12,200,000,000; Russia, \$8,500,000,000; Italy, \$4,000,000,000; Belgium, \$490,000,000; Serbia, \$330,000,000; Rumania, \$250,000,000; for the Central Powers, the cost

to Germany was \$14,600,000,000; to Austria, \$5,000,000,000; Turkey, \$650,000,000; Bulgaria, \$375,000,000. Of the daily cost, two-thirds was borne by the Entente and one-third by the Central Powers. Most of these vast sums were raised by the issue of government bonds and notes, most of which are listed below.

The Federal Reserve Board estimated the increases in the indebtedness of Great Britain, France, Russia, Germany, and Austria-Hungary at \$49,455,000,000, from the beginning of the war. This was divided as follows: Great Britain, to November, 1916, \$13,253,358,000; France, to September, 1916, \$8,038,500,000; Russia, to Dec. 31, 1916, \$7,973,274,000; total for these Allies, \$29,265,132,000; Germany, to Oct. 27, 1916, \$15,260,000,000; Austria-Hungary, to May, 1916, \$5,930,000,000. Great Britain's debt increased from \$3,450,000,000 in March, 1914. Russia's debt rose from Rs. 9,888,310,000, Jan. 1, 1914, to Rs. 25,220,936,000 in December, 1916.

**GREAT BRITAIN.** The financial and industrial preeminence of England never showed to greater effect than during 1916. Not only did she finance the greatest military expenditures the world has ever seen, but she retained very fully her command of various foreign markets in international trade and offset the largest unfavorable trade balance any nation has ever known. Many of her industries were carried on at a maximum capacity while others inevitably languished. Labor, as in all industrial nations, was relatively scarce, as were various materials, and wages and prices rapidly advanced. One evidence of the enormous volume of business was the total of £15,275,000,000 of bank clearings, an increase of £1,667,000,000 over 1915. Nevertheless there was a general decline in the market value of British securities; this decline, however, was almost negligible in comparison with that of the two preceding years and was in part compensated by the advance in the stocks of companies deriving benefits from the war. The *Bankers' Magazine* reported that the aggregate decline in market values of 387 issues from July 20, 1914 to December, 1916, was from \$18,400,000,000 to \$13,790,000,000. Sixty per cent of this shrinkage, however, occurred in 1914 and three-fifths of the remainder during 1915. The total imports for the year were approximately \$4,745,000,000, an increase of 10 per cent over 1915 and of 33 per cent over 1914. Exports aggregated about \$2,550,000,000, consequently the unfavorable trade balance exceeded \$2,000,000,000. The purchases from the United States alone exceeded \$2,000,000,000. In order to pay for these goods Great Britain continued the policy begun in 1915 of mobilizing securities owned by British subjects and placing these in New York as security for credits advanced by American bankers and investors on the basis of British bonds and treasury notes. By the close of the year over \$800,000,000 of such credits had been extended by America. On August 17th, a two-year 5 per cent loan of \$250,000,000 was announced by J. P. Morgan and Company, the British agents; a second collateral loan of \$300,000,000 at 5½ per cent was brought out in November. Moreover, the exports for the year showed an increase of about \$600,000,000 over 1915, revealing the tremendous effort being made to maintain the British trade position. This increase applied primarily to the trade with India, Dutch

East Indies, Central and South America, Egypt, and China, and related to the various kinds of textiles and iron and steel. Late in the year a Federation of British Industries was formed to deal with the current and after-war trade problems. Moreover, an effort was being made to ferret out all alien trade interests.

The war finances were prodigious. On February 21st the House of Commons voted a war credit of \$2,100,000,000; on May 23rd another credit of \$1,500,000,000; on July 24th another of \$2,250,000,000. On October 11th, the 13th war credit of \$1,500,000,000 was voted, making a grand total for the war of \$15,660,000,000. At the close of the year, however, preparations were being made for a new credit into which most previous loans were to be convertible. This convertibility applied also to treasury bills, of which an aggregate of \$5,540,000,000 had been issued up to December 16th. In announcing the new 1916-17 budget in April, Chancellor McKenna stated that the revenue from taxation for the year should approximate \$2,200,000,000 or \$352,000,000 above 1915-16. He announced that the war expenditures for 1915-16 aggregated \$8,000,000,000 and that this sum would be exceeded in 1916-17 by at least 20 per cent. Up to the close of 1916, however, aggregate loans of more than \$1,000,000,000 had been extended to allies and colonies. Among the principal sources of revenue was a new tax on excess profits, which up to December 16th, had produced \$358,177,000. Other important taxes were those on incomes, import duties on sugar, cocoa, and coffee, and taxation of motor cars, amusements, railway tickets, watches, and mineral waters.

**FRANCE.** The stimulation of industry by war in France was typical, that is, those industries in any way connected with the supply of war materials and all those supplying fundamental needs of the population were greatly stimulated. Labor was relatively scarce and wages and prices advanced rapidly. For the first seven months imports of foods, raw materials, and manufactured products totaled 5,410,000,000 francs and exports 854,000,000 francs. Compared with the same months of 1915 this was an increase of 25 per cent in imports and of over 60 per cent in exports. If to these be added the trade in war supplies, the imports aggregated 10,336,000,000 francs and exports 2,990,000,000 francs; this adverse trade balance of 7,346,000,000 francs was thus at the rate of more than 10,000,000,000 francs for the year. As a means of checking future plans of "economic penetration" steps were taken toward the establishment of a complete registration of every business man in France, including intimate details of his birth, marriage, and family connections. Moreover, at Paris, in the early summer had been held a conference of British, French, and Italian financiers for the consideration of harmonious policies in relation to international trade both during and subsequent to the war. In August the American Manufacturers' Export Association sent a commission to France at the invitation of the French government. It investigated the needs of the country, especially with reference to the reconstructive period following the war.

Problems of war finance were tremendous but readily met. Up to November, 1915, over 21,000,000,000 francs had been raised for war pur-

poses. At that time a new 5 per cent loan was offered to the public. In January, 1916, it was announced that this loan, which was issued at 88, had yielded net proceeds of 13,243,000,000 francs. The cost of the war is shown by the appropriation of 8,173,000,000 francs for the first quarter of 1916; of 7,817,000,000 francs for the second quarter; of 8,511,000,000 francs for the third quarter; and of 8,838,000,000 francs for the fourth quarter. Up to June 30th the total war expenditures were 47,000,000,000 francs: this included, however, nearly 1,000,000,000 francs loaned to Belgium, Serbia, Greece, and Montenegro, and more than 5,000,000,000 for the relief of soldiers' families and other welfare work. Many new taxes were imposed to provide a basis for these loans and other taxes were raised. The new income tax became effective in 1916; new taxes were imposed on house dogs and hunting dogs, while increased taxes were imposed on alcohol, wine, beer, cider, sugar, tobacco, horses, carriages, automobiles, billiard tables, clubs, hunting preserves, and mines.

GERMANY. As in other belligerent countries, the industries of Germany were most of them greatly stimulated by the war, while others were depressed. The latter included primarily those that had previously been engaged in export trade. As elsewhere also, labor was relatively scarce (see UNEMPLOYMENT) and unusual numbers of women were drawn into industrial pursuits. There was a scarcity of many raw materials previously imported; foods were scarce and mostly under governmental regulation (see PRICES); and advancing wages were not sufficient to offset the increasing cost of living. The Berlin Boerse did a reduced volume of business, but the year was marked by various outbursts of speculative interest in stocks of companies affected by the war. Foreign exchange did not constitute an important problem because the volume of imports and exports was small, but much attention was given to the organization of industry and finance, not only to meet the demands of war but in preparation for the return of peace. The German Imperial Commission for the Transition from War Economics to Peace Economics was the most important agency especially designed to marshal the resources of the Empire for an orderly and systematic effort to regain the lost position in world trade. Another very comprehensive agency was the German Industrial Council, embracing nearly the whole of German industry. Its object was "to assure in the future a unified representation of German industry." It was expected that this body and others would not only influence the domestic policies with reference to tariffs, manufacturing, and shipping, but would assist in the recovery of foreign markets throughout the world.

War finance, however, was the most absorbing topic in the financial year. Total war credits voted by the Reichstag up to the close of 1916, were \$16,500,000,000. Of this nearly \$12,000,000,000 had been raised by permanent loans, while the floating indebtedness was estimated at \$4,500,000,000. This latter was represented in the \$635,000,000 of notes issued by the war loan banks (Darlehnskassen), in the increase of \$1,190,000,000 in note circulation of the Reichsbank, and in the advances of this bank which reached a total of \$2,100,000,000. The first four

war loans produced 36,336,000,000 marks. The payment of subscriptions for the third war loan was completed in January. It brought 12,101,000,000 marks from 3,966,000 subscribers. The fourth loan launched the same month in the form of 4½ per cent treasury bills due July, 1932, and 5 per cent imperial bonds due October, 1924, produced 10,712,000,000 marks from 5,279,000 subscribers. Of the subscriptions 2,406,000 were for 200 marks or less, while 1,853,800 other subscriptions ranged from 300 marks to 1000 marks. About 60 per cent of these subscriptions were made through the special war loan banks. By means of these the tangible wealth of the country, including stocks and bonds and all material goods usable by a nation at war, were made available in place of cash for the purchase of government bonds. In the absence of import duties the sources of internal revenue were greatly increased, including a special assessment of 50 per cent on war profits. In spite of the war burdens the age for granting old-age pensions was reduced from 70 to 65 years in January.

RUSSIA. The effect of the war upon the industrial development of Russia was greatly to stimulate nearly every productive activity, and especially to hasten the process of industrialization. In 1916 the regulations for forming joint stock companies were simplified, with consequent increase in the number and capitalization of new corporations. The official balance sheet on the Russian State Bank showed total assets on Nov. 14, 1916, of 11,492,806,000 rubles. This was an increase in 12 months of 4,726,628,000 rubles, due to an increase in the amount of gold held abroad from 130,173,000 rubles, to 2,055,000,000 rubles and an increase in the short term obligations of the Imperial Treasury from 2,319,000,000 rubles to 6,202,000,000. The liabilities, on the other hand, showed an increase in note circulation from 5,040,000,000 rubles in November, 1915, to 8,083,000,000 rubles one year later. An indication of the great prosperity of the country was the increase in the deposits of the State Savings Bank of 1,690,000,000 rubles since Oct. 1, 1914.

Problems of war finance were great. In October, Minister of Finance P. L. Bark announced that the extraordinary expenditures on account of war in 1916 would be 12,870,000,000 rubles, besides 3,390,000,000 rubles for the normal budget. The abolition of the spirit monopoly had removed the most important single source of revenue, but the expansion of industry and the rapid accumulation of wealth made possible new sources of taxation more than sufficient to offset the loss. A new income tax became effective Jan. 1, 1917, and was estimated to yield 130,000,000 rubles the first year. The tax on war profits was expected to yield 55,000,000 rubles. Still more important was the tobacco tax, and the excises on sugar and tea, and of yet greater importance were the import duties, the state railways, and other state properties.

The total debt Jan. 1, 1917, was 25,220,000,000 rubles. This was an increase during 1916 of 6,344,000,000 rubles. This increase took the form of the following loans: Rs. 2,500,000,000 short term notes discounted in Russia; Rs. 1,046,000,000 of the same discounted in England; and a 5½ per cent loan issued in March and due in 1926, amounting to 2,000,000,000 rubles; and

small external loans, mostly in short term notes, sold in France, Japan, and the United States.

**JAPAN.** The war brought an unprecedented era of prosperity to Japan. It began to show its effects in the early months of 1915, the first order for arms and ammunition being placed there by Russia in March. Thereafter not only did the exportation of arms and ammunition increase rapidly, but the export trade with China, India, and Australasia reached unprecedented figures. The total exports for the year ending Sept. 30, 1916, exclusive of over 200,000,000 yen of munitions, amounted to 978,584,000 yen, an increase of 347,000,000 yen over the preceding year. In consequence arsenals, cotton spinning and weaving mills, the leather industry, and various branches of the chemical and dye industries were enormously stimulated. The merchant fleet, which reached the total of 1,885,000 tons, was employed at unusual profits, and ship building yards were working at full capacity. Consequently, banking and commercial transactions extended to a veritable boom. Foreign obligations of Japan were reduced to the amount of 120,000,000 yen, and in addition a credit of equal amount was created in Russia. On Oct. 15, 1916, the Bank of Japan held abroad assets of 450,000,000 yen, as against 220,000,000 yen on June 30, 1914; and in addition in the same period its specie reserve increased 93,000,000 yen. Bank deposits on June 30, 1916, aggregated 3,098,000,000 yen, an increase of nearly 600,000,000 yen for the year. Bank clearings for the year ending in September totaled 17,007,000,000 yen, an increase of nearly 70 per cent over either of the two preceding years. There was unusual activity on the stock exchange, some of the industrial securities affected by the war being quoted at 5 to 20 times their pre-war prices. Japan also found resources and initiative for extending railway construction in Manchuria and Mongolia; in developing steel works, and coal and iron mines in the Yangtzu Valley; and otherwise assisting in the development of the immense resources of China.

**CANADA.** As in the United States, the stimulus of war brought a great outburst of manufacturing and trading activity to Canada. In 1915 the exports exceeded imports by \$142,000,000. In the first eight months of 1916 exports totaled \$675,000,000, or \$80,000,000 more than during the entire year preceding; imports also increased, amounting to \$520,000,000 for the eight months, as compared with \$472,000,000 for the entire year 1915. Thus exports for the year exceeded \$1,000,000,000, or double those of the year before the war; and the unfavorable trade balance of 1913 of \$300,000,000 was turned into a favorable one of equal amount. The largest increases in exports were shown by manufactured goods, agricultural, animal, and mineral products. There was unusual activity in iron and steel, automobiles, textiles, and metal mining and refining. Labor was scarce at advancing wages, and an unusual number of women were drawn into all employments. Railway earnings were greater than ever before. It was anticipated, however, that the return of peace would bring profound changes, and the National Service Committee was formed to organize and classify national resources, encourage efficiency, and direct productive energy

to best channels. In anticipation of still higher tariffs following the war an unusual number of American companies established branches in Canada during 1916.

War finance engaged much attention. The extraordinary expenditures due to the war were about \$400,000,000 for the Dominion and \$100,000,000 for the provinces. The 1916-17 budget included \$250,000,000 for war expenditures. Of this 15 per cent was met by increased taxation. In August, 1914, the Dominion government appropriated \$50,000,000 for military purposes; in February, 1915, \$100,000,000; and in February, 1916, \$250,000,000. To meet these the following loans were made: \$25,000,000, 4½ per cent 1920-25 bonds placed in London in March, 1915; \$45,000,000, 5 per cent gold notes placed in New York, of which \$25,000,000 was redeemed in 1916 through conversion into 20-year Dominion bonds due in 1935; the 5 per cent war loan of 1915 of \$100,000,000 absorbed at home; the 5 per cent war loans of 1916 of \$75,000,000 issued in the United States in serial bonds due 1921-31; and a third 5 per cent war loan of \$100,000,000 issued in Canada in September, 1916. The Canadian government also undertook to establish in Canada credits for the British government to cover war purchases. The first established in 1915 amounted to \$50,000,000; others in 1916 amounted to \$175,000,000. These were offset at first by advances made to Canada by Great Britain represented in the expenditures for Canadian troops on the war front. But in August, 1916, Canada advanced to Great Britain \$100,000,000 of 3½ per cent and 4½ per cent Dominion bonds to defray the European expenses of its troops. These bonds were in turn used by Great Britain for the establishment of credits in the United States.

**SHIP PURCHASE BILL.** During 1915 it had been an important feature of President Wilson's policy to provide by government action additional shipping facilities for American trade. In his message in December, 1915, he urged the passage of a measure to provide for government-owned vessels as a means of restoring "our commercial independence on the seas." In February, 1916, such a bill had passed the House; it was again passed in May, 1916, by a vote of 211 to 161, only 12 Republicans voting in its favor. Both party platforms favored the restoration of American merchant marine, but while the Democrats approved the administration measure, the Republicans favored ship subsidies. The bill finally enacted provided for the creation of a shipping board of five members with extensive powers to regulate commerce at sea and to restrain monopolistic combinations. It was authorized to spend \$50,000,000, to be raised, if necessary, by bonds which the Secretary of the Treasury was given power to issue, for the purchase or construction of merchant ships. If such ships are not sought by private operators then the board is authorized to form a joint stock company to operate them, the government being the principal stockholder.

On December 22nd President Wilson appointed the following to constitute the board: John B. White, Republican, from Kansas City; Theodore Brent, Republican, of New Orleans; William Denman, Democrat, of San Francisco; John A. Donald, Democrat, of New York; and

Bernard M. Baker, Democrat, of Baltimore. They will receive \$7500 per year.

**FINLAND.** A country situated on the Gulf of Bothnia; a grand duchy of the Russian Empire, incorporated with the Empire by virtue of Article IV of the treaty of Fredrikshamn (Sept. 17, 1809). Capital, Helsingfors.

**AREA AND POPULATION.** Area in square kilometers and population by governments, Dec. 31, 1910, follow:

	Sq. km.	Pop.
Nyland	11,872	376,218
Abo-Bjorneborg	24,171	499,332
Tavastehus	21,584	342,821
Viborg	43,055	521,469
St. Michel	22,840	198,829
Kuoplo	42,780	383,777
Wasa	41,711	514,940
Uleåborg	165,641	328,311
Total	878,604*	3,115,197

\* Of which 47,829 sq. kilometers internal waters.

Helsingfors had 161,091 inhabitants in 1912, Abo 52,057, Viborg 28,257, Tammerfors 46,192, Nikolaistad 23,275, Bjorneborg 17,072, Uleaborg 21,271, Kuopio 16,266. Marriages in 1912 numbered 18,653, births, 94,620, deaths, 53,990, stillbirths, 2345.

**PRODUCTION AND COMMERCE.** The principal products for export are shown in the table of commerce below, values for the year 1913 in thousands of marks (gold):

Imports	1000 m.	Exports	1000 m.
Cereals	90,700	Timber	218,800
Machinery	33,100	Paper, etc.	71,300
Iron mfra.	29,100	Butter	85,300
Coffee	22,500	Hides, etc.	11,700
Hides, etc.	21,100	Woolen wares	8,500
Sugar	19,100	Cottons	6,900
Cotton	17,400	Fish	6,200
Fuel	14,900	Horses	4,200

Countries of origin and destination and totals are shown below for 1913, in thousands of marks:

	Imports	Exports
Germany	202,535	52,151
Russia	140,198	113,301
United Kingdom	60,660	108,565
Denmark	28,094	18,326
Sweden and Norway	29,353	11,916
France	7,118	38,528
Spain	2,692	12,180
Other	24,789	49,832
Total	495,434	404,799

Vessels entered (1913), 11,901, of 3,696,330 tons; cleared, 11,937, of 3,628,905. Merchant marine (Jan. 1, 1913), 3547 vessels, of 408,660 tons (507 steamers, of 71,297).

The receipts for 1914 were 167,835,456 marks, ordinary, and 1,268,358 marks, extraordinary revenue, 588,000 marks being taken from the funds; and expenditure 157,021,426 marks, ordinary, and 28,371,641 marks, extraordinary expenditure, 597,160 marks being disposed for the funds. Of the revenue 6,895,024 marks came from direct taxes; 59,098,992 marks from indirect taxes; 79,377,273 marks from the railways, forests, domains, and other properties of the state, and 22,464,167 marks, other revenues. The chief items of expenditure are: government, 3,247,543 marks; justice and prisons, 5,654,394 marks; military affairs, 15,166,162 marks;

civil administration, 14,995,353 marks; religion and education, 19,463,028 marks; communications, 52,497,687 marks; public debt, 8,023,957 marks; commerce and industries, 7,844,128 marks; agriculture, 7,584,604 marks; pensions and grants, 5,622,318 marks, etc.

**GOVERNMENT.** The Russian sovereign is the grand duke. There is a resident governor-general, and a secretary of state residing at Petrograd. The Diet is composed of 200 members elected for three years by universal suffrage.

**FINLAY, SIR ROBERT BANNATYNE.** See GREAT BRITAIN, *Government.*

**FINNEY, FREDERICK NORTON.** An American railroad engineer and president, died in San Francisco, March 18, 1916. He was born in Boston in 1832. After an education at Oberlin College and several years of law practice, he was connected as an engineer with various railroads of the Middle West from 1860 to 1870. In the latter year, as chief engineer and general superintendent, he began the construction of the Canada Southern (now Michigan Central) Railway, which took four years. From 1893 Mr. Finney was largely identified with the building and control of the Missouri, Kansas, and Texas, first as superintendent of construction till 1902, and as president from 1904 till 1906. In 1902-04, while president of the Missouri, Kansas, and Oklahoma, and of the Texas and Oklahoma, he built 389 miles of road which opened up Oklahoma and Indian Territory. He wrote: *Three Months in Italy* (1893); *A Souvenir of the Nile* (1896); *Letters from Across the Sea* (1909).

**FIRE INSURANCE.** See INSURANCE.

**FIRE PROTECTION.** In the larger cities of the United States, particularly in the North, in 1916 greater efforts than ever were being made toward fire prevention as distinguished from fire fighting, and the results of the work of several years previous were being manifested. In 1915 the cities of New York, Chicago, Boston, Cincinnati, and Milwaukee, where fire prevention work had been more or less well organized, all showed substantial reductions in the number of fires or in the losses involved over 1914, while in 1916 for these and other cities the good results continued, the largest fires being distinctly due to abnormal conditions produced by the war and not due to bad municipal housekeeping, though whether these were due to incendiary efforts, carelessness, or hazards inseparable from such industry and traffic, could not be always determined. There were general improvements in fire fighting equipment, such as increased motorization of apparatus and high pressure mains, but the most encouraging feature was the organization of fire prevention work carried out by fire officials and improved building regulations.

**AMERICAN FIRE LOSSES IN 1916.** The fire losses in the United States and Canada during 1916, as recorded by *The Journal of Commerce and Commercial Bulletin* (New York), aggregated \$231,442,995. This amount was above the annual average and was nearly \$50,000,000 ahead of 1915, when the losses reached a total of \$182,836,200. The losses for 1916 were only exceeded six times in the history of the country, and were largely contributed to by heavy losses in the South and in Canada, in addition to which the Black Tom Island explosion and fire

in New York harbor accounted for \$11,000,000 of the total. The total fire losses undoubtedly were increased in amount by the higher values of all classes of commodities.

Aside from the Black Tom Island disaster, the three fires which partook of the nature of general conflagrations, were all in the South. These were at Paris, Texas, causing a loss of \$7,000,000; at Augusta, Ga., causing a loss of \$5,000,000; and at Nashville, Tenn., causing a loss of \$1,500,000. The Canadian losses were heavy, mainly due to several large individual figures, including the Canadian Parliament building at Ottawa, with a loss of \$3,000,000, and the oatmeal mill at Peterboro, with a loss of \$1,500,000.

There were numerous losses in fires in plants devoted to the manufacture of war munitions or where such supplies were collected for shipment. Such fires included the Black Tom Island disaster, the Tennessee Copper Company's plant at Copper Hill, Tenn., and the munitions dock and steamers at Brooklyn.

The movement for national fire protection continued to make progress in 1916, notwithstanding the heavy losses, and where legislation was enacted it was along the lines of stimulating greater public interest in regulations and laws that would prevent fires.

In the year 1916 there were 49 fires which resulted in an estimated property damage of \$500,000 or over. These were as follows:

Location—Description	Estimated damage
Cincinnati, Ohio, railroad depot and express building	\$800,000
Youngstown, Ohio, business buildings	800,000
Ottumwa, Iowa, department store and other	500,000
Holly Springs, Miss., cotton compress	500,000
Ottawa, Ont., Parliament buildings	3,000,000
Fall River, Mass., department store and other	2,000,000
Kingsport, Tenn., chemical works	500,000
Quebec, Que., church	500,000
Pittsburgh, Pa., storage warehouse	500,000
Brooklyn, N. Y., dock, steamers, and lighters	2,000,000
Peoria, Ill., grain elevator	1,000,000
Brunswick, Ga., naval stores plant and yard	750,000
Buffalo, N. Y., fertilizer factory	550,000
St. John, N. B., steamer and cargo	600,000
St. Louis, Mo., glass works	500,000
Copper Hill, Tenn., munition plant	500,000
Nashville, Tenn., residence section	1,500,000
Augusta, Ga., several business blocks	5,000,000
Paris, Tex., general conflagration	7,000,000
Tulsa, Okla., oil field property	1,500,000
New Haven, Conn., railroad shops and yard	700,000
Houston, Tex., cotton and railroad shops	500,000
Bayonne, N. J., oil storage plant and piers	500,000
Decatur, Ala., cotton compress	1,000,000
Medicine Hat, Alberta, flour mill	500,000
Chicago, Ill., chair mfg. plant	500,000
Sandusky, Ohio, several business houses	500,000
Vancouver, B. C., wholesale fish market	600,000
San Francisco, Cal., pier and freight	750,000
Baltimore, Md., grain elevator	1,250,000
Stevens Pottery, Ga., pipe and clay works	500,000
Cleveland, Okla., five oil tanks	500,000
Seattle, Wash., steamship piers	500,000
New York City, storage warehouse	1,000,000
Jersey City, N. J., railroad terminal warehouses and steamers	11,000,000
Vallejo, Cal., flour warehouse	500,000
Merrill, Wis., tannery	500,000
Phoenix, N. Y., business section of town	684,000
Milwaukee, Wis., malt plant and elevator	500,000
Butler, Pa., steel car works	500,000
Oroville, Cal., lumber plant	500,000
St. Paul, Minn., lumber storage yard	512,000
Ithaca, N. Y., salt works	500,000
Chicago, Ill., freight yards and warehouses	500,000
Peterboro, Ont., oatmeal factory	1,500,000
Los Angeles, Cal., iron works	500,000
Fremont, Neb., grain elevator	500,000
Toronto, Ont., car barns and repair shop	500,000
Augusta, Ga., hotel	600,000

The aggregate fire waste of the United States and Canada during the 40 years from 1877 to 1916, inclusive, reached the enormous total of \$6,281,260,220, showing an annual average property destruction of \$157,031,505.

FIRE LOSSES DURING FORTY YEARS, 1877-1916

1916	\$231,442,995	1896	\$115,655,500
1915	182,886,200	1895	129,835,700
1914	285,591,850	1894	128,246,400
1913	224,728,850	1893	156,445,875
1912	225,320,900	1892	151,516,000
1911	284,337,250	1891	143,764,000
1910	284,470,650	1890	108,893,700
1909	203,649,200	1889	128,046,800
1908	238,562,250	1888	110,885,600
1907	215,671,250	1887	120,283,000
1906	459,710,000	1886	104,924,700
1905	175,193,800	1885	102,818,700
1904	252,554,050	1884	110,008,600
1903	156,195,700	1883	110,149,000
1902	149,260,850	1882	84,505,000
1901	164,347,450	1881	81,280,000
1900	163,362,250	1880	74,643,400
1899	136,773,200	1879	77,703,700
1898	119,650,500	1878	64,815,800
1897	110,319,650	1877	68,265,800

Total for forty years ..... \$6,281,260,220

**BLACK TOM ISLAND EXPLOSION AND FIRE.** As the most disastrous American fire of 1916 the explosion which occurred early on the morning of July 30th on Black Tom Island, New York Harbor, is worthy of record. The property loss involved was in excess of \$11,000,000, seven lives were lost, a number of persons were injured, and considerable dislocation of harbor facilities, particularly in the trans-shipment of war supplies, ensued. The fire was said to have started among some freight cars at the end of one of the piers of the National Dock and Storage Co., at Black Tom Island, and spread to a lighter tied up to one of the Lehigh Valley Railroad piers. This lighter was laden with high power explosives and munitions and soon exploded, scattering the fire to the adjoining piers. Cars filled with munitions were on adjoining tracks and these also exploded. Thirteen brick storage warehouses out of the 24 owned and operated by the National Storage Co. were destroyed as well as six piers owned by the storage company and leased to the Lehigh Valley Railroad. Several other brick warehouses were badly damaged, and minor damage was done to the Lehigh Valley grain elevator. Eighty-five loaded cars were destroyed and some 40,000 tons of raw sugar, valued at approximately \$3,400,000, were lost. The railroad officials claimed that the fire started in the barge tied up alongside its pier without authority.

**BOSTON HIGH PRESSURE SYSTEM.** During the year substantial changes in the design of the new high pressure fire service for Boston, Mass., that had been under consideration for several years, were recommended by Joseph Rourke, engineer in charge of the work. A smaller pumping station than was originally planned and the increased use of portable units were recommended, but the suggestions did not meet with the approval of insurance underwriters, who, it was believed, would refuse to remove the advance on rates made after the San Francisco fire. A reduction had been promised in the event of the construction of a system of high pressure mains and a pumping station of 24,000 gallons per minute capacity. In place

of this a small station with a capacity of 6500 gallons per minute at 250 pound pressure, located on the Charles River embankment, was recommended. Furthermore, it was proposed to use gas-driven instead of electrical centrifugal pumps, and with the money saved install a grid-iron pipe system of 11.5 miles with hydrant connection and service, instead of 6.5 miles for the present system which could be provided with the available appropriation. While the proposal was in the interest of economy it was not in line with modern fire practice, which aims to secure adequate pumping capacity at central stations and eliminate so far as possible all portable units. Indeed, Boston was the first American city to contemplate reducing the capacity of pumping stations, once their need had been determined.

**DWELLING HOUSE CONSTRUCTION.** An important publication of the year was *Dwelling Houses*, a code of suggestions for construction and fire protection recommended by the National Board of Fire Underwriters to safeguard homes and lives against the ravages of fire, and published by that body from whom copies may be obtained. This excellent manual, prepared by Ira H. Woolson, Consulting Engineer to the National Board, was intended for the owners of buildings and the carpenters and builders erecting them and was intensely practical, summarizing the best possible and safest construction. This book contains, in simple language, a discussion of all the structural features neces-

sary to make a dwelling reasonably fireproof and safe. It also includes a summary of general precautions for fire protection, all of which should be studied and observed.

**SCHOOL HOUSE CONSTRUCTION.** Serious fires in school houses led to the appointment of a Committee on School House Standardization by the National Educational Association, to frame standard plans for school building construction especially designed to reduce the fire risk. The chairman of the committee was Frank Irving Cooper, architect, of Boston, and the committee began its work by studying the standards already adopted for school building construction.

**STATISTICS OF FIRES.** The National Board of Fire Underwriters through its Committee on Statistics and Origin of Fires, during the year published its usual tables for the leading American and European cities, from which the accompanying information has been compiled. It is, of course, obvious that the great war in Europe prevented any complete summary in this field and that fire destruction due to military activity does not appear. In 1915 there were 25 American cities where the per capita fire loss exceeded \$5, Newport News, Va., heading the list with a per capita loss of \$28. That this is due to bad conditions of fire protection and prevention is shown by the fact that certain cities show large per capita losses for two or more years, and not as the result of a single large fire or conflagration.

STATISTICS OF FIRES IN AMERICAN CITIES, 1915

	Area Sq. Miles	Population	No. of Alarms	No. of Fires	Confined to Building or Place of Origin	Total Loss	No. of Fires per 1000 Pop.	Loss per Capita
New York	814.75	5,742,999	14,867	13,422	13,173	\$5,757,018	2.34	\$1.00
Chicago	194.4	2,455,000	13,634	11,209	11,098	5,111,984	4.57	2.08

**FISH AND FISHERIES.** The report of the United States Commissioner of Fisheries for the year ending June 30, 1915, appeared in December, 1915, and was the last available at the time of writing this summary. A considerable part of this report dealt with the work of the Bureau of Fisheries in the propagation and distribution of fish, in which substantial improvements have been made over previous years. The total output for the year was 536,260,143 eggs; 3,694,281,699 fry; 58,215,962 fingerlings, yearlings, and adults. Owing to increased efficiency in the work of the various stations, this was done at a lower relative cost than in earlier years. The greater part of these were salmon, trout, and bass, the most important, in the opinion of the commissioner, being the work on the Pacific salmon, of which the number actually liberated increased from 5,764,000 in 1914 to 28,642,000 in 1915. Egg collections and hatching operations were carried on in 32 States and in Alaska, while distribution was made to all of the States, to Porto Rico, Cuba, India, and Japan.

Minor operations of the Bureau of which no definite results were presented, were investigations leading to an increase in the oyster supply, and to attempts at acclimating the lobster on the Pacific coast. Special researches on the food and diseases of fishes, both of the utmost practical importance to the fish culturist, were carried on during the year.

The laboratory at Fairport, Iowa, has been devoting a good deal of time to the study of methods of propagating fresh water mussels, especially with reference to increasing the supply of shells for the button and pearl industries. It was demonstrated that mussels grown in a basket in the river at Fairport grew more than one inch in five and one-half months.

At the Beaufort laboratory, experiments on the rearing of the diamond-back terrapin have been in progress for some years, and it was found in 1915 that animals hatched in 1909 were laying eggs, thus demonstrating that under the conditions of domestication they mature in about six years. Some attention has been given by the Bureau to the question of raising frogs for commercial purposes, the main problem to be solved being the question of procuring a sufficient supply of food for the young frogs.

In spite of the efforts that have been made to increase the number of lobsters, the industry still shows a marked decline in the output, with at the same time an increase in the total value of the catch. Thus, in 1889, the total output was 30,771,573 pounds, valued at \$861,297, while in 1913 the catch was 12,267,017 pounds, valued at \$2,404,822. In 1912 and 1913 Rhode Island showed an increase in the amount of the catch, while Maine and Massachusetts, the chief other lobster producing States, showed a decrease.

For the calendar year 1914, there was landed at Boston, 92,334,192 pounds of fish, having a value of \$2,613,987; and at Gloucester 70,245,028 pounds, with a value of \$1,781,043. Of this, 72.81 per cent of the weight and 68.92 per cent of the value were from fishing grounds lying directly off the coast of the United States; 9.03 per cent of the weight and 9.94 of the value from off the Newfoundland coast; 17.70

per cent of the weight and 20.37 per cent of the value off the Canadian provinces, and only about 1 per cent of both weight and value off the Labrador coast. A detailed statement of the fish landed at these two ports is as follows:

Cod—	Pounds	Value
Fresh .....	36,079,878	\$917,908
Salt .....	11,449,752	441,508
<b>Haddock—</b>		
Fresh .....	57,598,606	1,378,069
Salt .....	155,522	3,087
<b>Hake—</b>		
Fresh .....	12,530,938	238,285
Salt .....	222,083	4,218

Fresh .....	1,499,844	177,669
<b>Miscellaneous—</b>		
Fresh .....	3,921,657	73,488

The report of a committee appointed to investigate the otter trawl method of fishing, was presented in 1915, and while somewhat inconclusive, indicated that this method is injurious to the fish too small to be of market value, and hence must be used with caution. The output of the mussel fisheries for the year was valued at \$382,210 of shells used in the manufacture of buttons, and \$164,261 worth of pearls found in the shells. The most important streams furnishing this material were Rock River and Illinois River. The appropriations for the conduct of the Bureau for the fiscal year 1915 were \$1,118,471.66. See ALASKA.

The United States government has been experimenting on the isolation of potash from the giant kelp of the California coast, and an unexpected result has been the claim that because of the destruction of the clams, spiny lobsters, and young fish that live in the kelp these experiments injure the fisheries. It appears, however, that the greater number of these animals are below the plane of action of the kelp cutters, which go down only six feet, and no real damage is being done. Recent California legislation allows the catching of catfishes of 7-inch length, and this is reported to be leading to their extermination.

According to G. A. Clark, an expert on the fur seal question, the regulations adopted by the United States government some years ago for the killing of seals are having the expected result in that an excessive number of young males are preserved, so that while there has been an increase of about 25 per cent in the number of the breeding females, since 1912,

the breeding males have increased 150 per cent. This leads to much fighting for the possession of the females, with consequent injury to the young.

It was announced late in the year that an agreement has been reached between the English and Holland governments that 20 per cent of the fish caught by Holland fishermen may go to Germany, 20 per cent to Holland, and the remainder may be sold to neutral countries. At this time the fishing vessels previously held by the English were released. In England, as a result of the interference with channel fishing due to the war, the importance of inshore and shallow water fisheries was emphasized by the fisheries authorities. Of great importance is the development here of the mussel and cockle fisheries. Mussels grow best in water that receives drainage from cultivated land, and that is apt to be contaminated, but it was stated that entirely satisfactory methods for cleansing the mollusks have been devised. See also section *Fisheries* under various countries and various States of the United States, and *ZOOLOGY*.

**FISHER, HERBERT A. L.** See *GREAT BRITAIN, Government*.

**FISKE, STEPHEN.** An American journalist and author, died in New York City April 27, 1916. Born in New Brunswick, N. J., in 1840, and educated at Rutgers College, he was early an editorial writer and correspondent on the New York *Herald*, for which paper he accompanied various foreign notables on tours of the United States. Later he reported news of the Civil War, was dramatic critic of the *Herald*, and accompanied Garibaldi on his last campaign against Rome. Mr. Fiske was subsequently known as a theatrical manager—of the St. James Theatre and Royal English Opera Company in London, and of the Fifth Avenue Theatre, New York. Two famous actresses introduced by him were Mary Anderson and Modjeska. He founded the New York *Dramatic Mirror*, for some time was dramatic editor of *The Field, Illustrated*, and he had written several plays and books, among the latter *Paddy from Cork, and Other Stories*.

**FISK UNIVERSITY.** A co-educational institution for colored students at Nashville, Tenn., founded in 1866. The institution had an enrollment of 558 in all departments in the fall of 1916, and the faculty numbered 53, including administrative officers. Among noteworthy gifts of the year was one of \$10,000 for current expenses, contributed by the General Education Board. The productive funds of the institution amounted, in 1916, to about \$240,500 and the income from all sources to about \$55,500. The library contains 15,000 volumes.

**FJELDEVENTGRET.** See *MUSIC, Opera*.

**FLAGG, CHARLES NOËL.** An American painter and art teacher, died at Hartford, Conn., Nov. 10, 1916. He was born in Brooklyn, N. Y., in 1848, but for most of his life he was identified with Connecticut and Hartford art circles. He studied under Jacquesson de la Chevreuse. In 1888 he founded the Connecticut League of Art Students, which became the Flagg Night School of Drawing for Men; of this he was directing instructor at the time of his death. Mr. Flagg served as first president of the Municipal Art Society of

Hartford, as secretary of the Society of Connecticut Artists, and as president of the Connecticut Academy of Fine Arts. He was also a member of the State capitol commission of sculpture. For the capitol (State library room) and the Supreme Court building in Hartford he did some of his most notable historical paintings. A portrait exhibited by him in 1908 at the National Academy of Design, of which he was elected associate the next year, was awarded the Thomas R. Proctor prize. Mr. Flagg contributed on art subjects to magazines and wrote *The Evolution of an Equestrian Statue* (1909).

**FLAX.** Information regarding the world's flax production in 1916 was very incomplete. Canada, which grows flax practically for seed only, produced about three-fourths of a normal crop. In Great Britain and Ireland, where it is grown for the fibre, the yield of straw was satisfactory and the yield of fibre was better than the year before. British India, which is one of the principal seed-producing countries, devoted 2,763,000 acres to the crop, as compared with 2,612,000 acres the year before. According to a Russian authority, the world's flax area is about 13,230,000 acres, of which Russia furnishes 28.8 per cent, British India 22.9 per cent, Argentina 22.3 per cent, United States 19.3 per cent, Austria-Hungary 1.6 per cent, Canada 1.3 per cent, and other countries 3.9 per cent.

The flaxseed production of the United States in 1916, as estimated by the Department of Agriculture, was 15,459,000 bushels from 1,605,000 acres, the yield per acre being 9.6 bushels. The corresponding figures for 1915 were 14,030,000 bushels, 1,387,000 acres, and 10.1 bushels respectively. The average farm value per bushel on Dec. 1, 1916, was \$2.48, the highest ever recorded, and the total value of the crop was \$38,350,000, also the highest on record. In 1915 the average farm value per bushel on Dec. 1 was \$1.74. In the State of Oregon efforts were continued to establish a flax fibre industry. Commercial and other interests raised a fund of \$6000 to grow 300 acres of fibre flax under the supervision of a Belgian flax expert, and farmers producing under contract flax of certain specified quality were paid a fixed amount per ton from a State appropriation for the purpose. It is estimated that from 3,000,000 to 5,000,000 acres in the Willamette Valley in Oregon and adjoining foothill country are suitable for growing fibre flax.

**FLETCHER, HENRY PRATHER.** An American diplomat, appointed by President Wilson Ambassador to Mexico; the nomination was confirmed by the Senate Feb. 25, 1916. Mr. Fletcher had been connected with the diplomatic service since 1902, as secretary to various legations, as chargé d'affaires for two periods in China, and as Minister to Chile (1910-16). In this last office he had done much to further friendship between the United States and the country to which he was accredited. His appointment to Mexico was considered a mark of great confidence, because of the delicate relations between the two nations. Mr. Fletcher was borne at Green Castle, Pa., in 1873, practiced law after his admission to the bar in 1894, and served in the Philippine Islands during the Spanish-American War.

**FLONZALEY QUARTET.** See **MUSIC, Chamber Music.**

**FLOODS AND FLOOD PREVENTION.** The occurrence of disastrous floods in 1916 again called attention to the fact that in the rapid growth of many American towns and cities located in valleys, adequate thought had not been given to the matter of possible freshets or floods and often the natural channels were encroached on. With many warnings in the past, the menace of flood was being realized in certain districts and studies of rainfall and drainage were being taken up in connection with the engineering problems of construction. Some of the more important projects of 1916 are outlined below.

**SOUTHERN FLOODS.** Much damage was done in the East Gulf and South Atlantic States by destructive floods in July. These floods were caused by two tropical cyclones, the first of which occurred on the night of July 5th-6th, and passed inland through Mississippi, with five days of rain that in some sections was extraordinary in amount. The second cyclonic storm passed inland through South Carolina and was accompanied and followed by unprecedented rains, producing flood conditions in the rivers, carrying away bridges, railways, roads, and buildings. The damage was particularly severe on the Southern, Atlantic Coast Line, and Seaboard Air Line railways. The loss of life resulting from the two storms was placed at 80 persons, for the most part drowned in the streams of North Carolina. The estimated property loss was put at \$21,724,000, divided as follows: Buildings, roads, bridges, culverts, etc., \$4,918,000; crops not gathered, \$11,606,000; live stock and movable farm property, \$811,000; suspension of business, loss of wages, etc., \$1,939,000; railroads in roadbed, bridges, trestles, culverts, etc., \$2,450,000.

**CABIN CREEK FLOOD.** On August 9th, a sudden rising of the water of Cabin Creek, W. Va., due to rainfall of great intensity, flooded a part of West Virginia, and resulted in the loss of some 60 or more lives, the destruction of houses and highways, the washing out of 18 miles of track on the Chesapeake and Ohio Railway, the destruction of electric railway lines, and the sweeping away of nearly every bridge by the torrent. About 400 square miles were affected and damage done that ran into millions of dollars. The flood occurred in broad daylight and thus afforded many a chance to escape, for the valleys in this section are narrow with steep sides.

**FLOODS IN SOUTHERN CALIFORNIA.** On January 16th to 18th Southern California experienced one of the most severe storms in its history, and on January 26th and 27th there occurred a storm of almost equal intensity. Both storms covered all of Southern Califor-

nia and completely demoralized all railway operation. As much as seven inches of rain fell at many places in the two days of the first storm and almost as much in the second storm. The Southern Pacific and the Atchison, Topeka, and Santa Fé railways were the principal sufferers, the line of the latter being out of service a total of 32 days.

**MIAMI VALLEY FLOOD PROTECTION WORK.** The severe and destructive flood of March 23-28, 1913, was the cause of an elaborate engineering investigation of the best possible means to protect the valley of the great Miami River, Ohio, against similar misfortune. A study was made of rainfall and floods experienced by the valley, and plans were made for the most practical control works in view of the greatest possible flood that could be expected. As a result of elaborate studies the engineers reached the conclusion that the best and only practicable method of flood protection for the Miami Valley was a group of retarding basins, and this finding was sustained unanimously late in 1916 by the nine judges of the Miami Conservancy Court, the main point of discussion being on the merits and strength of earth dams, which were the principal feature of the project.

The earliest discussion dealt mainly with the protection of the city of Dayton, but it was found that the entire valley was concerned and the only possible success lay in the coöperation of the communities affected. The earlier plans considered involved the construction of bypasses or cut-offs, widening and deepening the river channel, raising the heights of the levees, diversion of one or more arms of the river and other schemes, for most of which definite cost estimates were made. Finally, after the passage by the Ohio State Legislature of the conservancy law Feb. 17, 1914, and the establishment of the Miami Conservancy District June 24, 1915, an engineering investigation revealed that the most feasible project was to establish large storage reservoirs or retarding basins, as in the flat valley of the Miami and its tributaries there were excellent locations which permitted the construction of dams at reasonable cost and afforded vast storage volume. The plans provided for three basins just above Dayton, one on each of the three main streams that join within the city—the Taylorsville basin on the Miami, the Huffman basin on the Mad River, and the Englewood basin on the Stillwater. On the upper Miami the Lockington reservoir would protect the cities of Piqua and Troy, while on Tivin Creek, a tributary of the Miami below the city, the Germantown retarding basin would reduce the flow where the creek joined the river near Middletown. The accompanying table gives the numerical data for each of these basins.

Basins	Dem		Drainage Area, Sq. M.	Spill-way, Elevation	Water Surface at Spill-way, Acres	Capacity at Spillway Inches of Runoff on Drainage Area		Three-Day Filling with Outlets Discharging
	Height, Ft.	Length, Ft.				Acres	Instantaneous	
Germantown .....	107	1,210	270	815	3,520	106,000	7.30	10.75
Englewood .....	124½	4,660	651	876	7,980	312,000	8.99	10.70
Lockington .....	78	6,400	255	988	4,020	70,000	6.68	10.00
Taylorville .....	78	2,980	1,183	818	11,000	186,000	4.42	9.51
Huffman .....	73	3,340	671	835	9,180	167,000	4.66	9.52
					35,650	841,000		

The dams are each pierced by two to four conduits, permanently open and located at the base of the dam which normally pass the river flow, and under flood conditions discharge water under head. It is assumed in the plans that at the ultimate maximum flood the basins would fill approximately to spillway level, the spillways being provided at from 15 feet to 19 feet freeboard below the dam crest as a safety margin; for with a flood twice as great as that of 1913 the dams would have a freeboard of 5 feet. The conduits would be able to take care of a vast discharge when the basins were full to the spillway.

The cost of the main items of the Miami work is indicated below:

Retarding basins, not including real estate . .	\$6,735,000
Real estate in retarding basins . . . . .	3,500,000
Channel work and local protection . . . . .	3,468,000
Real estate other than in basins . . . . .	2,200,000
Public utilities, relocations, and damages . . .	2,307,000
<b>Total, not including interest, taxes, administration, and contingencies . . . . .</b>	<b>\$18,210,000</b>

The details of the project were fully outlined in the issues of *Engineering News* for the year and particularly in the numbers for Jan. 4 and 11, 1917.

**SCIOTO RIVER SCHEME.** A somewhat similar plan for the protection of Columbus, Ohio, by the control of the Scioto River valley was developed and at the end of the year was about ready to be submitted to a similar judicial inquiry. The temporary impounding of flood water in reservoirs ordinarily dry was thought to be a method of diminishing danger that was capable of much wider application.

**ERIE, PA.** To prevent any such disaster as occurred on Aug. 3, 1915, when the city of Erie was inundated by flood water in Mill Creek, resulting in the loss of 34 lives and \$2,000,000 damage to property (see *YEAR BOOK, 1915*), a \$1,000,000 project was put under way during 1916. Several methods were presented by consulting engineers, including a permanent storage reservoir, a detention reservoir, and a large conduit through the centre of the city. The last was adopted and involved more than two miles of a horseshoe-shaped reinforced-concrete conduit, 22 x 18 feet inside dimensions, located for most of this distance in the heart of the city. This new conduit follows a course where the buildings had been destroyed and removed by the flood. Placing the creek entirely underground would add 12 acres of valuable city property, formerly occupied by the creek bed and channel, to the taxable property of the city. At the same time it was decided to control the flood danger of Ganisoris Run and remove various grade crossings.

**MEMPHIS FLOOD PROTECTION.** During 1916 the city of Memphis, Tenn., had virtually completed a system of flood protection for the low lying portion of the city involving the construction of a levee with concrete core wall and a pumping station to lift the water draining from the territory back of the levee at times of flood. Much of the city is at higher elevations and in order to intercept and discharge to the river the water that otherwise would flow to the pumping station there were constructed two sewers or tunnels, one with a maximum diameter of 16 feet, the other with a maximum diameter of 15 feet. The new im-

provement guards against any flood up to the 50-foot stage of the river which had never risen higher than stage 46½. The levee is 6000 feet long, with a minimum top width of 40 feet and side slopes of 3 on 1. The crest was placed at level 52.5 feet. The main pumping plant has a capacity of 1200 cubic feet per second, while the low level pumping plant operated when the river is at or above stage 34, is of 160 cubic feet capacity. The main pumps are 72-inch centrifugal pumps electrically driven. This interesting plant was described in detail in *Engineering News*, May 11, 1916.

**FLOOD PREVENTION IN KANSAS.** This was the subject of a report by an engineering committee appointed by the Kansas Flood Congress which met in 1915. The report published in 1916 stated that on a conservative estimate the net losses in Kansas during the previous 13 years would amount approximately to \$52,000,000, or an average of \$4,000,000 annually. In addition to the direct monetary losses, there was involved also much indirect property loss and the sacrifice of more than 100 lives. The cost of flood protection must be paid, to a large extent, at least, by taxation upon the citizens of Kansas, though coöperation of the Federal government was necessary, however, for the complete solution of the problem, as many of the streams which cause damage in Kansas have part of their drainage area outside the State. It was also announced that a survey was to be made by the United States Engineers of the Kansas, Neosho, and Cottonwood rivers and their tributaries, with a view to the development of some system of flood control.

**MISSOURI FLOOD CONTROL.** In 1916 active work was in progress to reclaim nearly 1000 square miles of lowland in southwestern Missouri back from the Mississippi River and forming the Little River drainage district. The project involved an outlay of \$4,000,000, and the work included river diversion to a well defined channel to prevent the flood waters spreading over the district and the construction of large detention basins to equalize the flow. At the same time the surface water and rainfall were to be taken care of by an elaborate system of ditches aggregating some 600 miles in length which would serve to reclaim a large area of swamp.

**FLOOD LIGHTING.** See **ELECTRIC LIGHTING.**

**FLORIDA. POPULATION.** The estimated population of the State on Dec. 31, 1916, was 904,839. The population in 1910 was 752,619.

**AGRICULTURE.** The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture in 1915-16, were as follows:

	1916	Acreage	Prod. Bu.	Value
Corn . . . . .	1916	840,000	12,600,000	\$11,840,000
	1915	800,000	12,000,000	8,780,000
Oats . . . . .	1916	60,000	900,000	689,000
	1915	61,000	1,220,000	854,000
Rice . . . . .	1916	700	18,000	14,000
	1915	500	12,000	9,000
Potatoes . . . . .	1916	15,000	1,110,000	2,220,000
	1915	12,000	960,000	1,104,000
Hay . . . . .	1916	58,000	70,000	1,120,000
	1915	51,000	a 61,000	976,000
Tobacco . . . . .	1916	2,500	3,025,000	908,000
	1915	3,900	b 3,549,000	816,000
Cotton . . . . .	1916	197,000	48,000	6,412,000
	1915	193,000	48,000	3,409,000

a Tons. b Pounds. c Bales.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned, in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments . . . .	2,150	2,518
Average number of wage earners . . . . .	57,473	55,608
Capital invested . . . . .	\$65,291,000	\$88,319,000
Wages . . . . .	22,982,000	24,822,000
The value of materials used . . . . .	26,128,000	38,816,000
The value of products . . . . .	72,890,000	81,112,000

**MINERAL PRODUCTION.** The only mineral production of the State is phosphate rock. During 1915 this industry was in poor condition. Shortly after the outbreak of the war in Europe the phosphate mining companies curtailed their production very materially, or suspended mining altogether. The production in 1915 was 1,358,611 long tons, valued at \$3,762,239. This constituted 74 per cent of the entire production of the United States.

**TRANSPORTATION.** The total mileage of all tracks of the State on June 30, 1916, was 6060. Of this 5040 were single track. There were constructed during the year 115 miles of single track, and 47 miles of other track. The Florida East Coast Railway completed during the latter part of the year the construction of a line from Maytown to New Smyrna, a distance of seven miles. The Atlantic Coast Line began the construction of a line from the line south of Sebring, the objectives being some place on Lake Okeechobee and to Immokalee. The South Florida and Gulf Railway during the year was constructing a line from Keenansville to Fort Bassinger. About 23 miles of this had been completed.

**EDUCATION.** The school population of the State in 1915 was 275,310. There were enrolled in the public schools 177,154, with an average daily attendance of 126,565. There were 3208 female teachers, and 1074 male teachers. The average monthly salary of white male teachers was \$54.02, and of white female teachers \$36.44. The average monthly salary of negro male teachers was \$38.91, and of female teachers \$30.74. The total expenditures for schools during 1914-15 was \$2,769,335.

**FINANCE.** The latest report available for the financial condition of the State is for the fiscal year ending June 1, 1914. The receipts for the year amounted to \$3,429,784, and the disbursements to \$3,390,685, leaving a balance on hand Dec. 31, 1914, of \$1,522,769, which includes a balance at the beginning of the year of \$1,483,699. The public debt amounted to about \$600,000.

**CHARITIES AND CORRECTIONS.** The charitable institutions included the Florida Hospital for the Insane at Chattahoochee, and School for the Deaf and Blind at St. Augustine. The correctional institutions include the Florida Industrial School for Boys at Marianna and State Prison Farm at Raiford. An Industrial School for Girls has been provided for, and will be in operation during 1916.

Through the efforts of the Children's Home Society of Florida a bill was passed by the Legislature of 1915 providing for a commission to investigate and report on the matter of a law to pension indigent mothers by the State.

This commission was organized and the work was done during the year. At the next session of the Legislature the commission will recommend the enactment of such a law.

**POLITICS AND GOVERNMENT.** There were no unusual incidents in the political history of the State in 1916. The State always votes Democratic and the Democratic candidates for State and national officers were all elected. In addition to the Democratic ticket the Republican, Prohibition, and Socialist parties each had candidates for offices. For the first time a new Democratic primary law was put into effect. This resulted in some complications in the election for Governor. Sidney J. Catts was first declared the Democratic nominee in the primaries. W. V. Knott contested the result of the primaries, went into the courts and secured recounts of the vote in several counties, where it was found that a number of second choice votes had not been properly tabulated. These recounts gave the nomination to Knott, and the State canvassing board met and again declared Knott a nominee. In the meantime the Prohibition party nominated Sidney J. Catts for Governor. Mr. Catts neither accepted nor rejected the nomination, but circulated petitions in the several counties of the State, and had his name placed on the general election ballots as an independent candidate for Governor. While Mr. Knott was contesting the case in the courts, Mr. Catts was making thorough canvasses of the State. The campaign was hotly contested. In the election of November 7th Mr. Catts was elected Governor by a vote of 39,556, on the Prohibition Independent ticket. W. V. Knott, Democrat, received 30,343 votes. George W. Allen, Republican, received 10,333. In the vote for President the highest Democratic elector received 55,984 votes, and the highest Republican 14,611. Park Tremell, former Governor of the State, was elected United States Senator, defeating W. R. O'Neal, Republican, and R. L. Goodwin, Socialist. Three constitutional amendments were voted on, only one of which was adopted. This amendment exempted from taxation \$500 worth of property belonging to widows who have families dependent on them for support, and to men who have been maimed, either in battle or otherwise. The vote on this amendment was 20,859 for, and 12,641 against. An amendment to reapportion the Legislature, giving each county a Senator and basing the membership of the House of Representatives on population, largely increasing the present size of the Legislature, was defeated by a vote of 10,258 for, to 17,774 against. A "grandfather" clause amendment to the constitution was defeated by a vote of 10,518 for, to 19,688 against.

**STATE OFFICERS.** Governor, Sidney J. Catts; Secretary of State, H. Clay Crawford; Attorney-General, T. F. West; Comptroller, Ernest Amos; State Treasurer, J. C. Luning; Superintendent of Public Instruction, W. N. Sheats.

**JUDICIARY.** Supreme Court: Jefferson B. Browne, R. F. Taylor, James B. Whitfield, Thomas M. Shackelford, and W. H. Ellis.

**STATE LEGISLATURE.** Both Houses are Democratic.

**FLORIDA, UNIVERSITY OF.** A State educational institution at Gainesville, Fla. In 1915-16 the enrollment was 810 and the faculty numbered 65. The productive funds amounted

to \$200,000, and total income to \$135,000. The library contains 25,000 volumes. President, Albert Alexander Murphee.

**FLOTATION PROCESS.** See METALLURGY.

**FLOUR.** See FOOD AND NUTRITION.

**FLY, HOUSE.** See ENTOMOLOGY.

**FOLK-LORE.** See ANTHROPOLOGY.

**FOOD AND NUTRITION. COST OF FOOD.** The trend of food prices was sharply upward in 1916, and for December 1st, *Bradstreet's* recorded for the United States the highest commodity index in its history. This showed an increase of 28 per cent over the high-water mark reached on Dec. 1, 1915. The wholesale price of practically every important foodstuff had advanced, except rice. Flour had risen from \$5.30 to \$8 per barrel, milk from 5.25 to 7.25 cents per quart, bread from 4 to 5 cents per loaf, lard from 9.5 to nearly 17 cents per pound, potatoes from \$2.40 to \$5.25 per barrel, eggs from 38 to 45 cents per dozen, and many other articles in about the same proportion. A slight decrease in the prices of flour, lard, and potatoes, however, was noted during November.

As *Bradstreet's* remarked, "consumers in general were loud in their complaints about the burdens imposed by prices, the like of which has not been experienced since the period of reconstruction following the Civil War." There was much agitation for relief measures, and several bills were introduced into Congress, proposing such remedies as an embargo on exports of foodstuffs, the regulation of cold storage practices, and the extension of parcel post facilities. A country-wide investigation into the causes of the high prices was begun by the Attorney-General and several of the Federal departments, and similar inquiries were instituted by various State and local authorities. "Following reports of an attempted corner of cold storage eggs and an increase in retail prices in many localities to well-nigh prohibitive figures, egg boycotts were again organized in a number of cities. In New York City dealers were compelled by the State Department of Foods and Markets to stamp cold storage eggs as such, thereby preventing their sale as the fresh laid product." So-called "diet squads" were also organized in Chicago and elsewhere, to demonstrate the possibility of supplying adequate food within certain limits of cost, the publicity given these short trials attracting attention beyond their real merits.

The high prices were, however, world-wide, and in many countries there was also the problem of guarding against a scarcity of the food supply. In Canada, an order was issued under the War Measures Act in November, 1916, prohibiting combinations to enhance prices of the necessities of life and also the undue accumulation of supplies as in cold storage. Upon the reorganization of the British cabinet, late in the year, a food controller was appointed and orders issued restricting the prices of milk, requiring the milling of wheat to include a larger percentage of the by-products in the flour, and otherwise conserving the food supply. France had previously enacted a similar wheat-milling law and regulated the prices charged for cereals and their products, as well as restricted the killing of live stock. Steps were also taken in Spain to modernize the milling of wheat, with a view to increasing the flour production.

In Germany, where the husbanding of the

food supply had already been systematically enforced, many additional stringent regulations were adopted. A maximum price and other limitations were put on the fruit supply. Distribution cards were issued for eggs, and restrictions ordered on the use of milk, herring, potatoes, sugar, and other articles not previously regulated. In Sweden, Norway, and Greece, arrangements for the government to control food supplies and prices were being perfected. See PRICES.

**NUTRITION STUDIES.** The Secretary of Agriculture reported data covering the past 16 years which showed that, although the population of the United States had increased about 33 per cent, the per capita production of the principal food articles, except meats and dairy products, had remained approximately the same or increased. Even for meats there had been an increase since 1913.

Data collected as to the annual value of the food consumed in representative farm families showed an average of \$448 per annum, of which 58 per cent was produced on the farm. Animal products made up 58 per cent, groceries 25, vegetables 11, and fruits 6 per cent of the diet.

Studies of the prevention of spoilage and waste were continued, especially of eggs, fish, and fruit by-products. A simple process for drying surplus and cull potatoes was worked out by the Bureau of Chemistry, while in Germany it is estimated that 10,000,000 tons of potatoes were dried, large quantities being used in the "war bread" and other foods.

Holmes and Langworthy, of the Office of Home Economics, found that the "hard palates" of cattle could be utilized in meat loaves and similar dishes and were quite thoroughly digested, and that "bob veal" was as digestible as market veal, readily prepared for the table, and apparently not unwholesome or a cause of digestive disturbances. Milo maize, Kafir corn, and feterita were found to be promising additions to the human dietary, while kaoliang seemed less desirable. In studies elsewhere, rice flour, cottonseed flour, dried yeast, horse-chestnut flour, sugar-beet flour, and durra flour were successfully substituted for a part of the wheat flour in bread-making. A new "war bread" of higher protein content was devised in Germany, consisting of rye or wheat flour, potato flour, yeast, and salt, while a method was discovered for concealing the employment of blood in bread by decolorizing with hydrogen peroxide. The use of ground straw in bread was found to be undesirable, and the danger of using untested materials was emphasized by several cases of poisoning from eating ground narcissus bulbs. The use of the goose-fish, over 10,000,000 of which are discarded annually by fishermen in this country, was recommended by the United States Bureau of Fisheries, and steps were taken to encourage the use of the dog-fish under the name of "gray-fish."

The South Dakota Experiment Station found that although the newer breakfast foods did not differ materially in nutritive value, their retail price varied from 7.2 to 43.9 cents per pound. The Kentucky Station recommended the wrapping of bread at the bakery in porous paper as the best practice. Elsewhere, it was reported that sausage in skins was not a dangerous source of bacteria, if properly cooked, while eggs soft-boiled, coddled, or fried on only one

side, and candy, especially when hand-dipped, were found to be possible carriers of infection.

Some of the most important work of the year dealt with problems of growth and the relation of food to certain diseases. Soy-bean flour was found to be a promising source of protein and fat for small children suffering from gastrointestinal troubles. On the other hand, raw egg white was found to be decidedly indigestible, and it was suggested that the use of raw eggs, egg white, and albumin water in dietotherapy had little scientific basis. Tough, hard foods, meat vegetables, and acid fruits were found to be beneficial to the teeth of children, while a high carbohydrate diet was conducive to decay. At the Ohio Station, no relation was found between the iodine content of foods and the prevalence of goitre.

McCullum *et al.* demonstrated, at the Wisconsin Station, the necessity in growth of two dietary factors of unknown chemical composition, previously referred to collectively as "vitamins," but now called "fat-soluble A" and "water-soluble B," as well as the absence of these factors in many food materials. Elsewhere it was found that the sterilization of meats and grains may remove some substances essential to normal nutrition, especially the nutrition of the nervous system. Further evidence was accumulated that pellagra is a deficiency disease, perhaps caused by the too exclusive use of diets of wheat flour, corn meal, salt meats, and canned goods.

**BOOKS OF THE YEAR.** The following may be mentioned: Helen Kinne and Anna M. Cooley, *Food and Health* (New York, 1916); H. T. Vulté, *Household Chemistry* (Easton, Pa., 1916); H. W. Wiley, *Not by Bread Alone* (New York, 1916); E. H. S. Bailey, *Laboratory Experiments on Food Products* (Philadelphia, 1916); Martha L. Metcalf, *Students' Manual in Household Arts—Food and Cookery* (Indianapolis, 1916).

**FOOD COMMISSIONS.** See PRICES.

**FOOD CONTROL, FOREIGN.** See PRICES.

**FOOT AND MOUTH DISEASE.** See VETERINARY MEDICINE.

**FOOTBALL.** Interest in the game of football as played by the American colleges showed a remarkable increase during the season of 1916. The Yale-Harvard battle in the Yale Bowl at New Haven attracted a throng of 80,000 persons, while the Army-Navy contest at the Polo Grounds, New York City, was witnessed by 50,000. It is estimated that 35,000 football games were played throughout the United States and that the total number of spectators numbered 6,500,000.

The year was full of surprises for the followers of the gridiron game. Elevens which had never before figured in the championship ratings attained their ambition in 1916. Pittsburgh, Colgate, and Brown were the new names added to football's hall of fame. Pittsburgh went through the season without suffering a defeat, but the teams met by the Pennsylvanians were not of the high calibre that Colgate and Brown were forced to contend with. The most notable victories won by Pittsburgh were those over Pennsylvania, Washington and Jefferson, Syracuse, and Penn State.

The one blot on the record of Colgate was the defeat of the New Yorkers by Yale. In this contest, however, some of the star Colgate play-

ers either were unable to take part or were suffering from injuries received in previous games, and not in condition to do themselves justice. Against Brown, which had already defeated Yale and Harvard, Colgate was at its best, and it was the opinion of the experts that at this particular time even Pittsburgh would have been overthrown by Larry Bankart's men.

The year was noteworthy for Yale in that for the first time in six years the Blue defeated Harvard. The touch down scored by Neville which brought victory to the New Haven team was the first made against the Crimson by Yale since Percy D. Haughton became coach at Cambridge. Yale also was victorious over Princeton, its only setback coming from Brown. Harvard succeeded in getting revenge for the defeat at the hands of Cornell in 1915, winning from the Ithacans by a goodly margin.

Ohio State University carried off the honors among the Conference colleges of the Middle West, while on the Pacific Coast the University of Washington and the University of Oregon developed the best teams. Georgia Institute of Technology and the University of Tennessee were the leaders in the South.

Walter Camp made the following selections for his All-America first team:

Ends—Baston, Minnesota, and Moseley, Yale; tackles, West, Colgate, and Horning, Colgate; guards, Black, Yale, and Dadmun, Harvard; centre, Peck, Pittsburgh; quarterback, Anderson, Colgate; halfbacks, Oliphant, West Point, and Pollard, Brown; fullback, Harley, Ohio State.

A summary of the games played by the leading college teams follows:

Pittsburgh 58, Westminster 0; Pittsburgh 20, Navy 19; Pittsburgh 30, Syracuse 0; Pittsburgh 20, Pennsylvania 0; Pittsburgh 46, Allegheny 0; Pittsburgh 37, Washington and Jefferson 0; Pittsburgh 14, Carnegie Institute of Technology 6; Pittsburgh 31, Penn State 0.

Colgate 54, Susquehanna 0; Colgate 28, Maine 0; Colgate 15, Illinois 3; Colgate 33, Rhode Island State 0; Colgate 27, Springfield Y. M. C. A. College 14; Colgate 3, Yale 7; Colgate 35, Rochester 6; Colgate 15, Syracuse 0; Colgate 28, Brown 0.

Brown 18, Rhode Island State 0; Brown 42, Trinity 0; Brown 69, Amherst 0; Brown 20, Williams 0; Brown 21, Rutgers 3; Brown 40, Vermont 0; Brown 21, Yale 6; Brown 21, Harvard 0; Brown 0, Colgate 28.

According to figures compiled by the Associated Press, football caused 15 deaths during 1916, as against a total of 16 in the preceding year. College officials identified with the sport contend that in no instance did death occur in any game in which the players were known to be physically as well as mentally trained for the severe test. The majority of those who lost their lives were members of high school, semi-professional, and independent elevens. Only one of the victims was a college player.

Association football, or soccer, had another successful year, the feature of which was the tour of the All-America team of the United States Football Association through the Scandinavian countries. Six games were played, the Americans winning three, drawing two, and losing one. The results of the contests follow: All-America 1, Stockholm Tigrarna 1; All-America 3, All-Sweden 2; All-America 0, Stockholm A. I. K. and Djurgardens I. F. (combined) 3; All-America 2, Gothenburg, O. I. 1; All-America 1, All-Norway 1; All-America 2, Stockholm A. I. K. and Djurgardens I. F. (combined) 1.

The Bethlehem Steel Co. Football Club captured both the National Challenge Trophy and the American Football Association Cup, defeating the Fall River Rovers in the final match for the first-named prize and the Scottish-Americans for the A. F. A. award. The University of Pennsylvania won the intercollegiate championship.

The usual competitions were held in the United Kingdom, but the attendance was naturally much less than in the years before the war. The proceeds of many of these games went to various war relief funds. The honors in the Football League were won by Manchester City, but the team that stood out most prominently during the year was Chelsea, which won 17 games and lost only two. The Celtics carried off the laurels in the Scottish League.

**FORDHAM UNIVERSITY.** A Roman Catholic educational institution in New York  
Y. B. 16—9.

City. It was founded in 1841. The enrollment in the fall of 1916 in the different departments was as follows: College, 365; law, 523; medicine, 287; pharmacy, 122—a total of 1297. In addition, there were 200 students in sociological courses. The university has \$75,000 in productive funds, which last year yielded \$3125. The library contains 72,700 volumes. President, Rev. Joseph A. Mulry, S. J.

**FORD PEACE EXPEDITION.** See UNITED STATES AND THE WAR.

**FOREIGN EXCHANGE.** See FINANCIAL REVIEW.

**FOREIGN TRADE.** See FINANCIAL REVIEW.

**FORESTRY.** The most notable events in the forest world in 1916 was the wholesale destruction of forests for war purposes in the European countries usually dependent on timber imports, and the resultant stimulation to forest protective activities as well as the more economic utilization of forest products in America. Reduced shipping facilities, combined with high freight and handling costs, rendered exports of American timbers practically prohibitive. By virtue of their favorable position with respect to enemy forests the Teutonic allies suffered least from lack of timber. In England and France, on the other hand, many parks and woodlands not originally intended as lumber producers have been cut clean by corps of Canadian lumbermen. Italy also was drawing extensively on her reserve stock of standing timber. Although an active reforestation propaganda has developed in these countries, the present economic condition in relation to lumber is serious, and it is expected that the forests and forest products of America will play an important part in the upbuilding of Europe after the war. Canada has been especially active in seeking these future markets. During the year a Dominion Trade Commission was sent abroad for this purpose. In British Columbia local shipbuilding was subsidized and ships are being constructed primarily for the timber trade of the province. Recent mechanical tests of British Columbia Douglas fir made in England have shown its high superiority over Baltic timber for railway ties. Reports on the forest resources of British Columbia and Saskatchewan were completed and work in connection with a forest survey in New Brunswick was actively under way. The Dominion government has excluded all foreign lumber in connection with the public work. The Canadian Pacific Railway took similar action. The United States government has prepared a report on American woods available for exports, containing information of use to American consuls and foreign purchasers.

**FOREST PROTECTION.** The most serious forest fire in America in 1916 occurred during the late summer in Northern Ontario. Over two hundred persons were killed and many others injured. Several villages and large amounts of timber were also destroyed. Summing up the forest fire situation as a whole, it may be said that the efficiency of organized fire protection in America has been thoroughly demonstrated, and that in recent years disastrous fires, such as the above, have been confined to poorly-protected sections. A strong campaign is under way to reorganize the protective system in Ontario. Although government and private agencies are cooperating more closely there is still room for

improvement. The United States Forest Service estimates that in the calendar year 1915 some 40,000 fires burned over about 6,000,000 acres of forest area in the United States, with a money loss in timber, young tree growth, and improvements of at least \$7,000,000. For the same period, the organized protective system on the National Forests confined 6324 fires to 155,416 acres, with a total loss of only \$353,389. This was accomplished at a cost of only \$212,436. Similar results are being secured in organized cooperative work with States and private agencies. Twenty-one States are now cooperating with the government in protecting watersheds of navigable streams from fire. At present there are 40 fire protective associations among the timber owners, chiefly in the Northwest. The land thus privately protected is estimated at approximately 25,000,000 acres.

**THE NATIONAL FOREST SERVICE.** On June 30, 1916, there were 152 National Forests in the United States, with a total area of 176,088,608 acres, of which 20,668,328 acres is private land. Presidential proclamations and executive orders during the year excluded from the National Forests 8,534,061 acres of land and added 116,916 acres. A very large part of the agricultural lands in the forests have now been eliminated. Only 2589 applications for forest homesteads were received in 1916 as compared with 4433 in 1915. The total receipts from the National Forests during the year ended June 30, 1916, amounted to \$2,823,540.71. Of this amount over \$1,000,000 is returnable to the States in which the forests are situated for county, school, and road purposes (see 1914 YEAR BOOK). In addition to these State allotments a provision of the Federal Aid Road bill, which became a law on July 11th, appropriates \$1,000,000 a year for 10 years for the construction and maintenance of roads and trails within or partly within the National Forests in cooperation with the various States and counties concerned, provided that not more than 10 per cent of the value of the timber and forage resources of the National Forests within these areas may be spent for roads and trails.

On recommendation of the Forest Service, the National Forest Reservation Commission approved for purchase during the year under the act of March 1, 1911, 54,898 acres in the Southern Appalachians and White Mountains. The total approved and being acquired is now 1,329,487 acres, of which 706,974.50 acres have been acquired. On 143,247.67 acres condemnation proceedings are pending. The remainder awaits the completion of survey or title examination. Continuation of the purchase policy was provided for by a new appropriation of \$3,000,000, available for the fiscal years 1917 and 1918. The Sieur de Monts National Monument, which includes more than 5000 acres on Mt. Desert Island, Maine, directly south of Bar Harbor, was created by presidential proclamation on July 8, 1916.

Investigative work on the National Forests followed in the main the same lines as in previous years. In the kiln drying of lumber the most important developments of the year were the discovery of a method of piling which improves circulation, the perfection of a method for southern pine lumber which permits drying in 39 hours from green to shipping weight with a loss of less than 1 per cent, and the per-

fection of a method for red gum, one of the most difficult and refractory woods to dry, which reduces ordinary commercial losses of approximately 15 per cent to less than 1 per cent. These processes have been developed on a semi-commercial scale. The drying of maple shoe lasts, of which a great number are used in the United States, has been difficult because of the size of the blocks from which they are manufactured. On a semi-commercial scale the period required for drying has been reduced to seven weeks from nearly two years, without increased loss. The value of the dyeing principle of the Osage-orange wood has been so conclusively shown that from \$750,000 to \$1,000,000 worth of the dye is now being manufactured annually in the United States, practically all from material which was formerly wasted. Investigations conducted at the laboratory have resulted in the use of spent tanbark in the manufacture of asphalt shingles to the extent of 160 tons per week. A new process has been developed on a semi-commercial scale for the manufacture of kraft or wrapping paper, and the suitability of 13 National Forest species for its manufacture has been shown. In addition to improving the quality and increasing the strength, the process promises reduced costs of at least 10 to 15 per cent and increased yields of at least 5 per cent. A method has been discovered whereby the yields of alcohol and acetate of lime from the destructive distillation of hardwoods have been increased 15 per cent.

**TREE DISEASES.** The State of Pennsylvania has renewed its campaign in the control of chestnut blight, white pine blister rust, and other tree diseases, and J. G. Sanders, formerly Wisconsin State Entomologist, has been placed in charge of this work. Late in the year the United States Department of Agriculture announced a serious outbreak of the European poplar canker in the United States. This disease attacks the twigs, limbs, and trunks of the black and Lombardy poplars (*Populus nigra*) and of the Carolina poplars or cottonwoods (*P. deltoides*), and may be expected to attack other species of poplars and cottonwoods in regions not yet investigated. During the present year the pathologist of the Department found the disease prevalent in small areas in certain districts in the States of New Hampshire, Massachusetts, Rhode Island, Connecticut, New Jersey, Pennsylvania, Delaware, Maryland, Ohio, Nebraska, and New Mexico.

**FOREST SCHOOLS, PERSONNEL, ETC.** The forest academy at Eisenach, founded in 1830 and productive of many noted foresters, has been abolished owing to financial difficulties due to the war. The forest school of the Philippines has been separated from the College of Agriculture and made a distinct school of the University of the Philippines. Arthur F. Fischer has been appointed Acting Chief of the Philippine Forest Service in the absence of W. F. Sherfese, who is now acting as forestry adviser to China and co-director of the Forestry Bureau at Peking. This bureau was inaugurated at the beginning of the year under the Department of Agriculture and Commerce. Dr. Schenck, formerly director of the Biltmore School, is occupying an administrative position in Brussels, Belgium.

The State College of Washington, the New York State College of Forestry at Syracuse, and

the University of Minnesota are offering correspondence courses in lumber and its uses. The University of California commenced a new four-year course in forest or logging engineering. The Oregon Agricultural College has completed a \$40,000 forestry building. The Yale Forest School has instituted research and instruction in tropical forestry. Forest instruction may now be obtained in 52 institutions in the United States, 23 of which give courses leading to a degree in forestry.

The first Southern forestry congress was held at Asheville, N. C., from July 11th to 15th. Many lumbermen, railroad men, and private landowners interested in fire protective organizations were present.

At the annual meeting of the Society of American Foresters, held on January 22nd, in Washington, D. C., Dr. B. E. Fernow was elected president. The society introduced recommendations of the executive committee looking to the amalgamation of the *Proceedings of the Society of American Foresters* and the *Forestry Quarterly*. Mr. Charles Lathrop Pack was re-elected president of the American Forestry Association at its annual meeting in Boston, January 17th. At the annual meeting of the Canadian Forestry Association, Ottawa, January 20th, Lieut.-Col. J. B. Miller was elected president.

From exhibitors at the Panama-Pacific International Exposition, the University of California has received a large amount of demonstration material for forestry, including the very complete collection of Japanese lumber presented by the Japanese government, and representative samples of the principal woods of China, Honduras, and Guatemala. Sweden gave an exhibit showing by-products obtained through distillation of wood. North Carolina has received a gift of a tract of land in the loblolly pine region to be used for experimental and demonstration forests. The Government of British Columbia recently presented the Kew Gardens, London, with a fir flagstaff over 214 feet long, nearly 3 feet in diameter at the base, and 1 foot in diameter at the top.

**NECROLOGY.** Dr. Richard Hess, the well known professor of forestry at the University of Giessen, died on January 18th, aged 81 years.

**Bibliography.** F. F. Moon, *The Book of Forestry* (New York and London, 1916); E. P. Stebbing, *British Forestry* (London, 1916); J. A. Ferguson, *Farm Forestry* (New York, 1916); A. Jolyet, *Traité Pratique de Sylviculture* (2 ed., rev., Paris, 1916); R. Dalrymple-Hay, *Forestry Handbook.—I, Forest Principles and Practice* (Sydney, 1915); F. Roth, *Michigan Manual of Forestry.—II, Forest Valuation* (vol. ii, Ann Arbor, Mich., 1916); J. W. Toumey, *Seeding and Planting* (New York, 1916); J. Rafn, *The Testing of Forest Seeds During Twenty-five Years, 1887-1912* (Copenhagen, 1915); W. Bullock, *Timber, from the Forest to Its Use in Commerce* (London and New York, 1915); W. Compton, *The Organization of the Lumber Industry* (Chicago, 1916); O. P. M. Goss and C. Heinmiller, *Structural Timber Handbook on Pacific Coast Woods* (Seattle, Wash., 1916); and J. F. Woodroffe and H. H. Smith, *The Rubber Industry of the Amazon and How Its Supremacy Can Be Maintained* (London, 1915). During the year the United States Department of the Interior issued a number of publications descriptive of the National Parks, among which may be men-

tioned: J. F. Pernot, *Forests of Crater Lake National Park*; G. F. Allen, *The Forests of Mount Rainier National Park*; and C. L. Hill, *Forests of Yosemite, Sequoia, and General Grant National Parks*.

**FORMOSA.** An island dependency of Japan, off the coast of the Chinese Province of Fukien. Capital, Dai-Hoku (or Taipei). Area of the Island of Formosa, 2318.5 square ri; of the seven adjacent isles, 5.6 square ri; total, 2324.1 square ri (13,841 square miles). Estimated population at the end of 1914, 3,812,184; at the end of 1913, 3,543,553, of whom 3,390,452 were indigenes, 133,937 Japanese, and 19,164 foreigners. The population Dec. 31, 1911, of Dai-Hoku (consisting of Jonai, Moko, and Daitote) is stated at 95,077; Dainan (or Tainan), 59,601; Kaga (or Chia-i), 22,418; Rokko (or Lukong), 19,153; Kiilung (or Keelung), 17,962.

The agricultural products include rice (by far the most important) and other cereals, tea, sugar-cane, sweet potatoes, jute, and hemp. The area planted to rice in 1913 is reported at 498,431 cho, yielding 5,126,317 koku, as compared with 485,213 cho and 4,046,611 koku in 1912 (1 cho = 2.45 acres; 1 koku = about 1.804 hectolitres, or 4.963 English bushels). The number of cattle in 1913 was 428,307; goats, 129,094; swine, 1,321,920; horses, 179. An important forest product is camphor, which is worked as a government monopoly. The mineral output in 1913 was valued at 4,015,102 yen, as compared with 4,302,969 in 1912 and 3,066,914 in 1908 (the yen has a par value of 49.846 cents). Output value in 1912 and 1913 respectively, in thousands of yen: gold, 2137 and 1502; coal, 892 and 1222; copper, 1031 and 998; silver, 132 and 63; other minerals, 110 and 230. Fishery produce in 1912 was valued at 992,737 yen and in 1913 at 1,412,118 yen. The manufactures of Formosa include flour, sugar, spirits, tobacco, oil, and soap.

Imports and exports were valued at 52,893,085 and 58,720,430 yen respectively in 1914, as compared with 60,853,709 and 53,378,369 in 1913. Imports from and exports to foreign countries and from and to Japan are reported as follows:

	Imports		Exports	
	Foreign	Japan	Foreign	Japan
1904	12,590,010	10,156,311	12,391,124	10,481,807
1912	19,807,126	48,325,290	14,960,228	47,881,451
1913	18,023,724	42,835,593	12,942,442	40,446,620
1914	18,013,987	39,879,148	12,982,314	45,788,116

In 1914, classified imports and exports (both the foreign and the Japanese trade) included the following, in thousands of yen: rice, other cereals, flour, etc., 3499 and 6184; other food-stuffs, together with beverages and tobacco, 12,136 and 36,616; drugs, dyes, etc., 4484 and 9285; cotton fabrics, yarn, etc., 8049 and 799; minerals, pottery, metal goods, etc., 2454 and 3061.

Revenue and expenditure for the year 1913-14 are reported at 54,217,922 and 44,473,781 yen respectively; the budget for 1914-15 balanced at 48,337,133 yen; for 1915-16, the estimated revenue was 41,746,912 yen, the estimated expenditure 41,702,690 yen. Formosa is administered by a Japanese governor-general.

**FORTIFICATIONS.** See MILITARY PROGRESS.

**FOUNTAIN, DRINKING.** See HYGIENE.

FOURTH OF JULY INJURIES. See TETANUS.

FRANCE. A republic in western Europe, since Sept. 4, 1870; one of the original members of the Triple Entente in the War of the Nations. It is divided into 87 departments, including the Island of Corsica, in the Mediterranean, off the west coast of Italy. Capital, Paris.

AREA AND POPULATION. No later figures for area and population are available than those given in the preceding YEAR BOOK, but they are repeated here for convenience. The area is stated at 53,646,374 hectares, equivalent to 536,464 square kilometers, or 207,129 square miles. The table following gives, by departments, areas in square kilometers, legal population according to the censuses of 1911 and 1906, and density in 1911:

	Sq. km.	1911	1906	Dens.

Marriages in 1913 numbered 298,760 (311,929 in 1912), and 169,011 in 1914; births, 779,658 (784,963), and 594,222; deaths, 737,757 (727,052), and 647,549. In the death figures for 1914 war victims are not included.

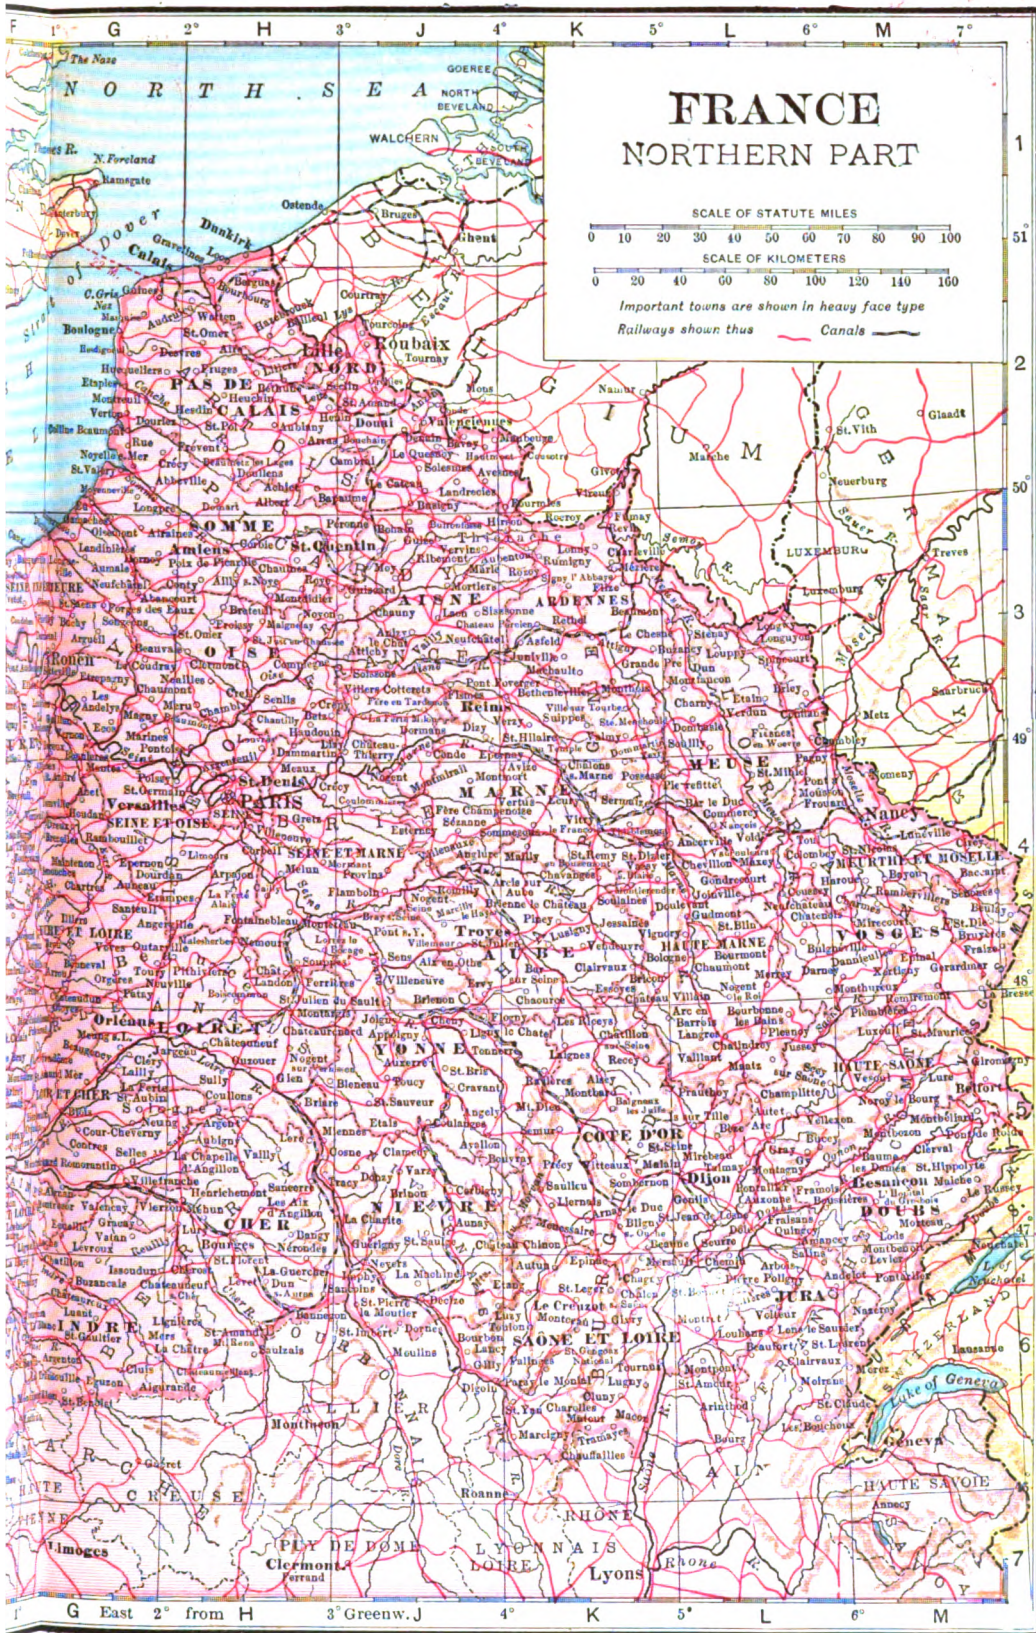

Some of the principal cities, with their communal population in 1911, are as follows: Paris, 2,888,110 (1,053,262 in 1851); Marseilles, 550,619; Lyons, 523,796; Bordeaux, 261,673; Lille, 217,807; Nantes, 170,535; Toulouse, 149,576; Saint-Etienne, 148,656; Nice, 142,940; Le Havre, 136,159; Rouen, 124,987; Roubaix, 122,723; Nancy, 119,949; Reims, 115,178; Toulon, 104,582; Amiens, 93,207; Limoges, 92,181; Prest, 90,540; Angers, 83,786; Tourcoing, 82,644; Nîmes, 80,437; Montpellier, 80,230; Rennes, 79,372; Grenoble, 77,438; Dijon, 76,874; Tours, 73,398; Calais, 73,322; Orléans, 72,096; Saint-Denis, 71,759; Le Mans, 69,361; Levallois-Perret, 68,703; Clermont-Ferrand, 65,386; Versailles, 60,458; Besançon, 57,978; Boulogne-sur-Seine, 57,027; Saint-Quentin, 55,571; Troyes, 55,486; Boulogne, 53,128; Béziers, 51,042; Avignon, 49,304; Lorient, 49,039; Caen, 46,934; Clichy, 46,676; Bourges, 45,735; Neuilly-sur-Seine, 44,616; Cherbourg, 43,731; Montreuil, 43,217; Asnières, 42,583; Villeurbanne, 42,526; Saint-Ouen, 41,904; Poitiers, 41,242; Perpignan, 39,510; Belfort, 39,371; Dunkerque, 38,891; Vincennes, 38,568; Ivry, 38,307; Saint-Nazaire, 38,267; Angoulême, 38,211; Courbevoie, 38,138; Aubervilliers, 37,558; Pau, 37,149; Roanne, 36,097; La Rochelle, 36,371; Pantin, 36,359; Douai, 36,314; Le Creusot, 35,587; Rochefort, 35,019; Valenciennes, 34,766; Montluçon, 33,799; Périgueux, 33,548; Cette, 33,049; Puteaux, 32,223; Lenc, 31,812; Chalons-sur-Saône, 31,550; Châlons-sur-Marne, 31,367; Arles, 31,010; Carcassonne, 30,889; Laval, 30,252; Epinal, 30,042.

EDUCATION. The educational system is highly

developed. Under control of the central administration are the ministry of public instruction; the Superior Education Council, charged with the actual administration; the Consultative Committee (advisory); educational bureaux and inspecting staffs, whose heads report direct to the minister. Under local administration are territorial academies, with inspecting staffs for all grades, and departmental councils, presided over by the *prefet*, charged especially with primary education. By the law of July, 1904, all congregationist institutions were to be suppressed within 10 years, and many were at once closed, some reopening under lay management. Primary instruction is secular, compulsory, and free between the ages of 6 and 13. Schools include (a) infants; (b) lower primary; (c) higher primary. There are supplementary courses, and courses for adults. Lower and higher primary certificates are granted. Numerous private courses are aided from local funds. Schools are for boys, for girls, or mixed. Secondary schools include state lycées, communal colleges, and many private establishments, with a seven-years' course, either (a) purely classical; (b) purely modern; (c) Latin and sciences; or (d) Latin and modern languages. The degree of bachelor is conferred on completion. For females a similar organization exists; course five to six years. Especially well known are the schools at Sèvres and the Sorbonne. Special schools are very numerous, many public institutions being dependent on ministries other than that of public instruction. State universities alone grant university degrees, but numerous private faculties and private institutions further higher education, as those at Aix, Algiers, Angers, Bordeaux, Caen, Clermont, Dijon, Grenoble, Lille, Lyons, Marseilles, Montauban, Montpellier, Nancy, Nantes, Paris, Poitiers, Rennes, and Toulouse.

**AGRICULTURE.** Out of the total area of the country as given by the ministry of the interior—52,955,764 hectares—23,678,846 hectares are given as under grape crops and sown meadows, 4,884,400 under natural meadows, 1,568,030 under forage grasses, 3,610,430 under pastures, 1,684,523 under vines, 3,909,480 uncultivated lands, 1,372,486 in rosaries, shrubberies, market gardens, etc., 9,329,193 under forests, and 2,916,376 hectares put to various uses not included in any of the foregoing.

Official sources of information for the current year being unavailable on account of the war, we have derived figures for areas (in acres) under main crops and production (in metric tons) from a British source.

	Acres		M. Tons	
	1914	1915	1914	1915
Wheat . . . . .	15,382	14,229	7,870,321	6,472,020
Mixed grains . . . . .			133,976	114,210
Rye . . . . .	2,578	2,700	1,138,326	992,820
Barley . . . . .	1,781	1,852	1,004,493	786,275
Buckwheat . . . . .				
Oats . . . . .	8,549	9,204	4,665,472	3,746,220
Corn . . . . .				
Potatoes . . . . .			11,992,718	9,057,092
S. beets . . . . .			3,751,066	1,508,283
Tobacco . . . . .			24,173	15,491
Wines * . . . .	3,811,555	3,807,982	1,316,849	448,819

\* Production figures are in thousands of gallons of wine.

It will be seen that the figures are far from complete. The production of cider in 1915 is

given as 649,154,000 gallons; wine import, 184,866,000 gallons; wine export, 22,286,000 gallons. In 1915 the total production from silk-worm eggs put into incubation was 1,727,326 kilograms (4,423,046 in 1913), valued at 4,243,027 francs (15,655,016 francs in 1913). Live stock July 1, 1915, included horses, 2,227,209; mules, 152,266; donkeys, 337,244; cattle, 12,286,849; sheep, 13,483,189; goats, 469,487; swine, 5,490,796. In view of the speculation concerning food supplies in the belligerent countries, the following table of visible supplies of grain—stocks of cereal products stored in customs warehouses on August 31st of the years indicated—may be of interest (quantities in quintals):

	1916	1915	1914
Wheat, etc. . . . .		14,615	848,129
Barley . . . . .	4,683	1,995	38,543
Oats . . . . .	1,803	195	75,764
Corn . . . . .	63,928	1,947	147,032
Flour . . . . .	2,468	13,087	19,892

See AGRICULTURAL EDUCATION; AGRICULTURE. **MINING AND METALS.** The mineral resources are comparatively small. They include, however, coal (40,843,618 metric tons in 1913), iron ore (21,714,000), copper (242 tons in 1912), lead and silver (13,953), antimony (11,018), zinc (45,929), and salt (1,098,515). Production of pig iron (1913), 5,311,316 tons; worked steel, 4,635,166.

In 1912 there were 1459 conceded mines, covering an area of 1,166,353 hectares, of which 469, covering an area of 596,262 hectares, were in operation. In these mines, 236,966 persons were employed—168,358 underground, 68,608 at surface. Total estimated number of work days, 67,991,633; total estimated wages, 358,001,473 francs. Total output, 62,284,573 tons, valued at 775,403,262 francs at the pit's mouth. The quarries employed 134,087 work people; output, 53,279,845 tons, valued at 293,623,038 francs.

**MANUFACTURES.** Among the most important manufactures are watches, jewelry, cabinet-work, carving, pottery and glass, chemicals, dyes, paper, woolens, carpets, linen, silk, and lace. The sugar works employ over 32,000 persons, and the yield in 1914-15 was estimated at 302,961 tons—a falling off from the year preceding which showed a yield of 877,656 tons.

**COMMERCE.** By presidential decree dated July 31, 1914, the exports of all kinds of farinaceous foodstuffs and fodder had been prohibited since the decree was communicated to the prefects. By presidential decree dated Oct. 18, 1914, the export of cotton and cotton waste has been prohibited since October 19th. Exceptions to these orders may, however, be granted.

By an order of Aug. 22, 1915, raw cotton was declared contraband of war. The export of oleaginous fruits and seeds has been prohibited to all countries except the United Kingdom, British dominions, colonies, and protectorates (including Egypt), the uninvaded territory of Belgium, Japan, Russia, and American countries.

The ministry of finance is empowered to grant permission for export of certain articles to the Netherlands, provided that they are consigned to the Netherlands Overseas Trust. Permission may also be granted for export to Switzerland in respect of a considerable number of articles such as wheat, corn, oats, barley, rye,

rice, flour, cotton, fodder, etc. Consignment must be made to the *Société Suisse de Surveillance Economique*.

The principal imports are wool, cotton, coal, silk, oleaginous fruits and seeds, machinery, raw skins, copper, timber, wines, coffee, rubber, cereals, and minerals. The principal exports are cotton tissues, silk tissues, wool, woolen tissues, wines, silks, millinery and artificial flowers, automobiles, raw hides, tools and metal goods, dressed skins, machinery, ladies' made-up garments, chemical products, pig iron and iron and steel, woolen yarns, raw rubber, butter, and refined sugar.

Official figures for the trade of the current year are lacking and 1915 figures are subject to revision. (See below, paragraphs on *History*.) The following table gives special trade for comparative years in thousands of francs:

	1913	1914	1915
Imports .....	8,421,800	6,402,200	8,074,500
Exports .....	6,880,200	4,868,800	3,022,800

The next table shows values of important articles in the special trade for comparative years, and exhibits significant fluctuations (values in millions of francs):

Imports	1909	1910	1913	1913	1914	1915
Wool .....	684.4	658.9	684.6	698.8	526.1	166.8

SHIPPING. The number of ships, French and foreign, with their aggregate tonnage, entered and cleared, exclusive of coasting, during the years 1912 and 1913, are shown below:

	1912		1913	
	No.	Tons	No.	Tons
Entered:				
French ...	8,093	7,581,374	8,167	8,308,165
Foreign ..	21,793	23,721,433	21,751	26,200,791
Total ..	29,886	31,302,807	29,918	34,508,956
Cleared:				
French ...	8,338	7,763,518	7,263	7,473,230
Foreign ..	21,766	23,709,449	14,393	18,636,188
Total ..	30,004	31,472,968	21,651	26,109,418

Of the total tonnage entered, 8,571,244 tons were registered at Marseilles, 4,592,658 at Cherbourg, 3,849,563 at Le Havre, 3,478,481 at Boulogne, 2,284,666 at Rouen, 2,007,302 at Bordeaux, 1,680,084 at Dunkerque, 1,225,310 at Calais.

Merchant marine, Jan. 1, 1913: 15,813 sailing vessels, of 614,024 tons; 1857 steamers, of 904,494—total, 17,670 vessels, of 1,518,518 tons. On Jan. 1, 1907, the mercantile marine, comprising boats of two tons and upwards, amounted to 16,999 vessels of 1,390,542 net tons (of which 15,488 were sailing ships, representing 677,055 net tons). See below, paragraphs on *History*, also articles SHIPBUILDING and SHIPPING.

COMMUNICATIONS. The system of railways in France is very extensive; they are almost entirely *concedés*, and become state property after the expiration of the concession. There were reported in operation Dec. 31, 1913, 40,786 kilometers of main railway lines, and 10,645 of local lines.

The military and industrial conditions of France during 1916 were closely dependent upon the railway, and such military achievements as the holding of Verdun were only possible by the supplies of artillery, munitions, and troops brought forward by rail. France is supplied by six railway systems with a total mileage of 25,000, which radiate from Paris and by means of the Grande Ceinture, a strategic railway which circles the capital at an average distance of 10 miles, these can be worked together as a single unit. It was built with an original capital of \$12,000,000, \$3,000,000 of which was advanced by the government and normally earned about \$100,000. Fortunately laid with heavy steel rails on a well built roadbed it has well served its purpose. This road was constantly used in the transfer of troops. Thus, troops from the south of France via the Paris-Lyons-Mediterranean Railway were sent to the Northern

Railway and the front by the Grande Ceinture. There were ample freight and passenger terminals within Paris and these again facilitated operations.

With many railway employees serving with the armies women had taken the places of men to a large extent, and it was stated that exclusive of the Nord and Est or the light and secondary railways, i.e., taking only the so-called "interior systems," 32,000 women were in the railway service on July 1, 1916, and the number was increasing. On the state railways, women numbered at the beginning of July, 10.8 per cent of the pre-war staff; on the Paris, Lyons, and Mediterranean, 12.3 per cent; on the Orléans, 14 per cent; and on the Midi the figure was given as high as 16.7 per cent.

As showing the extraordinary conditions due to the war it was stated that a number of Serbian railway men were working at various railway centres in France. Altogether, the Paris-Orléans and the Paris, Lyons, and Mediterranean companies have 500 of these men.

Railway receipts in 1916 showed a remarkable resumption of prosperity, the total for the Western, the Paris, Lyons, and Mediterranean, Orléans, and the Midi railways reaching \$144,000,000 for the first six months of the year 1916, as against \$123,400,000 for the first half of 1915. This total actually indicated an excess of \$13,600,000 over peace time; that is, for the first six months of 1914. A great portion of the Northern Railway system and some part of the Eastern Railway system at the end of 1916 were in the hands of the Germans, and both systems were almost entirely in the military zone. Nevertheless, the Northern receipts reached \$23,800,000 for the first half of 1916, as against \$14,800,000 for the corresponding period of 1915; and the Eastern receipts for the same period were \$22,800,000 for 1916, and \$15,200,000 for 1915.

**FINANCE.** The French government has been compelled to borrow from the Bank of France, the conditions of the Paris money market making borrowing on a national scale impossible. When war was declared, French credit was in a disorganized condition owing to a newly issued *rente* loan. On Oct. 7, 1915, the Bank of France had advanced to the state £276,000,000, and issued notes of £546,563,400, against a gold holding of £184,053,600. The French exchange has been favorable to London (October, 27.30 francs to the £1, or 2 francs above normal). See below, under *History*, also the article **FINANCIAL REVIEW**.

In the table below are shown actual revenue and expenditure for two years, with estimates for 1914 (in francs):

	1911	1912	1914
Revenue	4,689,045,845	4,857,491,193	3,984,106,936
Expend.	4,547,015,741	4,742,756,094	5,191,643,085

A comparative table for 1914 and 1915, showing details of the budget for those years, may be of interest at this time. Amounts are in francs.

Revenue	1914	1915
Direct taxes	635,931,436	613,806,726
Registration	615,011,000	463,594,500
Stamps	195,952,000	146,167,500
Exchange	5,718,500	1,812,000
Income tax	153,340,000	157,782,000
Customs	577,613,000	764,144,000

Revenue	1914	1915
Indirect taxes	562,108,000	477,069,000
Mineral oil	1,455,000	227,000
Sugar	181,908,000	236,617,000
Tobacco	517,687,000	502,349,000
Matches	89,572,000	40,839,000
Lighters	585,000	950,000
Gunpowder	12,333,000	3,091,000
Posts, tels. and tels.	859,965,300	289,861,000
Various	919,100	565,200
Domains, etc.	124,008,600	185,681,100
Total	3,984,106,936	3,883,971,126

Expenditure	1914	1915
War	1,203,659,712	16,178,118,293

Public works	358,944,913	607,809,214
Total	5,191,643,085	21,961,462,479

The special-services budget balanced at 816,329,331 francs for 1913. The total debt, Jan. 1, 1914, stood at 32,880,809,509 francs, of which the floating debt was 1,432,412,800 francs (October 1st). See **BANKS AND BANKING**; **FINANCIAL REVIEW**.

**ARMY.** See **MILITARY PROGRESS**; **WAR OF THE NATIONS**.

**NAVY.** See **NAVAL PROGRESS**; **WAR OF THE NATIONS**.

**GOVERNMENT.** The republic was proclaimed Sept. 4, 1870. The constitution is that of Feb. 24, 1875, amended Aug. 2 and Nov. 30, 1875, Dec. 9, 1884, June 16, 1885. Two chambers compose the National Assembly, which convenes annually. Three hundred members, aged not less than 40 years and elected by delegates for nine years, make up the Senate. There remained in 1912 only three of the life members elected by the Assembly, previous to the introduction of the present system. The members (597; one to every 70,000 inhabitants) of the Chamber of Deputies are elected for four years by direct popular vote. The President (1913-20, Raymond Poincaré) is elected for seven years by the Assembly, by an absolute majority of votes. His cabinet, responsible to the legislative body, is chosen by himself; in the majority of cases it is made up from members of one or other of the two chambers, but not necessarily so.

## HISTORY

**CRITICISM OF THE MINISTRY.** The most engrossing questions during the year 1916, as in the preceding year, centred about the authority of the high command and the enforcement of parliamentary control. Socialists and Radical Socialists complained again on February 18th that the general staff had been entrusted with too much power. A motion introduced by M. Abel Ferry called upon the government to exercise its authority in the zone of the armies. The conditions were said to be unfavorable to military efficiency, since authority was so divided in the army zone that military headquarters had become a sort of ministry and General Joffre was

overwhelmed with administrative work. M. Briand declared that inasmuch as the government was already exercising control in the army zone, the motion if it meant anything, meant that the government was not doing its duty. If therefore the Chamber insisted on discussing the measure the government had no other recourse than to resign. He said that a general debate would be harmful to the country at large as implying that dissensions existed in the government. The Chamber passed a vote of confidence by a majority of 394. Later, however, in June the Premier agreed to the parliamentary request that the military situation should be explained in confidence, and secret sessions lasting several days were followed on June 22nd by a renewed vote of confidence, 440 to 97, and by the resolution of the Chamber by a vote of 444 to 80 to refrain from interfering in the control of military operations but to assume charge of industrial and military preparations. The Senate also held secret sessions on July 3rd and voted almost unanimously in support of the government, though there were some very influential members in the Opposition, among them MM. Pichon and Clémenceau. The majority of the Socialist party remained faithful to the government's war policy despite the opposition of certain prominent Socialists in Parliament. In December, 1915, the Congress of the Unified Socialists had passed a resolution favoring the prosecution of the war till German leadership had been overthrown and Alsace-Lorraine regained, and on April 9th the National Council of the Socialists voted by a large majority against the renewal of relations with Socialist groups in enemy countries. An important change in the ministry resulted from the resignation of the Minister of War, General Gallieni, on account of ill-health on March 16th; he was succeeded by General Pierre Auguste Roques. General Gallieni died about two months after his resignation.

**SOLIDIFICATION OF THE ENTENTE.** On February 10th, the French Premier, M. Briand, with two members of his cabinet made a visit to Rome where he was received by the Italian Foreign Minister, Baron Sonnino. The purpose of the visit was to insure perfect accord between Italy and the Entente Allies, and especially more complete unity of action both in a military and a political sense. It looked to a later Allied conference and to the establishment in the future of what should amount to an Allied General Staff. The war council of the Allies, held in Paris on March 28th, adopted unanimously a series of resolutions looking to the consolidation of the Allies and unity of action in the economic and diplomatic fields as well as in the military, and providing for an economic conference.

**TRADE AFTER THE WAR.** Early in the year there was much discussion of the policy to be pursued after the war in regard to trade relations between the Allies, and the French Chambers of Commerce were required to express their views, and then submit them to an Association of British Chambers of Commerce. (See *GREAT BRITAIN, History*.) At the Interparliamentary Economic Conference at Paris, April 26th-29th, closer economic union between the Entente Allies was urged, and it was recommended that the losers in the war should pay the damages and that measures should be taken against the alleged policy of "dumping" on the part of the

Central Powers. Before the meeting of the Economic Conference of the Allies in Paris (see following paragraph) French public opinion was focused upon the various measures to check German commercial advance after the war. The treaty of Frankfurt was destroyed by the war, and France was determined never to fall again into that position of commercial vassalage which the treaty had caused. The means by which this was to be avoided were, first, a tariff war against "dumping," second, a campaign against any sort of subsidizing measures whereby German shipping obtained an advantage, and third, the prevention of the establishment of commercial associations which really covered a system of espionage. Much was made of the alleged plan of Germany to carry on a great "dumping campaign" after the war. This, it was said, was to be done by the exportation of large quantities of cheap goods which were even now in readiness, and which were to be given in exchange for raw materials. The Germans, it was said, hoped to regain at once their lost markets. It was alleged that manufacturers' associations of a new kind had been formed in Westphalia, Bavaria, and Saxony aiming at a union of efforts to prevent wasteful methods of marketing, that makers of optical and surgical instruments and of a great variety of machines were also incorporated, and that the amount of commodities in store for this future "dumping" process was already very large.

**ALLIES' ECONOMIC CONFERENCE.** The results of the Economic Conference held from June 14th to June 17th inclusive were received with much gratification by the French public. Certain optimists went so far as to see in it a step toward the United States of Europe. The comments in brief upheld the decisions of the Conference and urged that not merely defensive measures, but aggressive plans should be undertaken to paralyze German trade. The Conference showed the willingness on the part of the respective members to give way to one another's wishes, and a spirit of harmony prevailed. See *WAR OF THE NATIONS*.

**SCARCITY OF SHIPPING.** The heavy freight charges resulting from war conditions were the subject of much discussion during the year. Before the war the French merchant marine held fifth place among the nations of the world and its tonnage was about 2,500,000, as compared with 21,000,000 for the British merchant marine, and about 12,000,000 for the neutral nations. On account of the drafting of vessels into the government service as well as the losses during the war, the French merchant fleet by the summer of 1916 had scarcely more than a tonnage of 1,000,000. Hence, while under normal conditions the exporters could choose between different vessels, now they were obliged to compete with each other, and the consequence was that freights rose enormously. Many ways of dealing with the situation were proposed. There was much criticism of the shipowners, on the ground that they took advantage of the crisis to make extortionate demands. On the other hand, it was pointed out that the conditions themselves by the operation of economic laws necessarily forced the prices up. At the conference of the Entente Allies in Paris on March 28th, the fourth resolution adopted, as noted above, was directed in a general way toward this problem. It decided to organize at

London a central international bureau on freight rates, and to seek some means of sharing in a fair manner among the Allies the heavy charges resulting from present conditions and of lowering the cost of freight. Under normal conditions only 25 per cent of the tonnage in French ports is under the French flag. In the summer of 1916 the proportion had greatly diminished, since more than half of that tonnage had been absorbed for military necessities and the invasion of the richest portion of France had caused a great demand for foreign produce and for foreign transport service. Hence if the government requisitioned the French merchant vessels or reduced the taxes on the small number that remained, no great benefit would result to the consumer. On April 4, 1916, the French government issued a decree for the purpose of making sure of the best possible employment of the ships and forbade, first, voyages from one foreign point to another foreign point; second, voyages from France which did not have any advantage in regard to the provisioning of the country. Some suggested that the only remedy, and it was a difficult one, was to increase the number of ships by building new ones. See SHIPBUILDING and SHIPPING.

**INCREASED COST OF LIVING.** As indicating the reasons for the increased cost of living in France, the following points were mentioned: One reason for the high prices was the increase in the credit circulation, which had risen from 6,000,000,000 francs in 1914, to about 16,000,000,000 in 1916. There were signs of imprudence and increased consumption among the population. At the beginning of the war there had been a tendency toward strict economy, but after a short time, the country having more money in circulation, the people began to spend more. At the same time the national production decreased in all fields on account of the lack of skilled workmen. In 1916 it was reported that the land planted to crops had diminished 740,000 hectares since 1915, and as a result of the lack of insufficient tillage and fertilizers, the average production per hectare had largely decreased. The production of French sugar was reported to have fallen between 1912 and 1915 from 876,000 tons to 303,000, chiefly on account of the loss of the most fertile sugar producing tracts. Moreover, the invasion had robbed France of her richest coal mines, reducing the output from 40,000,000 to 20,000,000 tons. Two-thirds of the coal fields were in the hands of the Germans. As a result of these conditions, France necessarily had recourse in large measure to importation, and in 1915 the value of imports had exceeded that of exports by 5,500,000,000. In 1916, at the end of October, the excess was reported at 11,000,000,000. The imports of wheat alone were placed at 8,800,000,000. All these heavy expenses and the still more severe pressure of war cost lowered the national credit and reduced the rate of exchange. Toward the close of 1916, the franc no longer had its customary value abroad. As a result of the necessary use of vessels for the importation of provisions, there was the above-mentioned scarcity of shipping. It was estimated that one-half of the British merchant fleet and the whole of the German, Austrian, French, and Italian fleets were withdrawn from international trade either on account of requisitions or on account of the blockade. Again, the submarine war rendered the transit of merchant

vessels more and more dangerous. Similar scarcity was felt in means of land transport. In the northern department of France the Germans had taken 50,000 of the French cars, while the needs of the French army itself withdrew much of the French rolling stock. See FINANCIAL REVIEW, paragraphs *Foreign Trade and France*.

**THE CENSORSHIP.** Throughout the year there were severe criticisms of the methods employed by the censorship, and in May notice was given of an interpellation of the government on the subject. M. Briand, however, begged the Chamber to forego that discussion as it exasperated public opinion. He went on to show the absolute necessity of confidence in the government and said that if there were not confidence in the present government it ought to resign and make way for others. The discussion was postponed (May 18th). The objections to the censorship were that it was ill exercised and needlessly exasperated the journalists, causing ill feeling between them and the Chamber. And inasmuch as they would have their revenge as soon as it was removed, the policy seemed especially unwise. It was complained that the censorship suppressed without discrimination and allowed serious things to go through while crucifying trifles. An instance was given of a caricature which represented the Premier as a juggler tossing in his hands the head of M. Clémenceau. The censorship forbade its appearance. The author took it to M. Clémenceau who said he had not the slightest objection to its publication, but when the illustrator took it back again to the office of censorship they persisted in their refusal. Upon the reorganization of the government at the close of the year a modification of the censorship was promised. See below, paragraph, Government by Decree.

**THE OCCUPIED TERRITORY.** Parliamentary investigation into the damage done in the departments occupied by the Germans was carried on at the end of July. According to the figures given, 2554 of the 36,247 communes into which France is divided, that is about 7 per cent, were still held by the Germans, and 247 had been completely cleared of their inhabitants, owing to their proximity to the seat of military operations. Owing to the strict German censorship precise and trustworthy details could not be had as to the conditions in the parts of France held by the enemy, but many rumors were circulated indicating that the sufferings were severe and that German methods were needlessly harsh. In Lille, for example, the great industrial city in Northern France, and one of the richest in the whole country, it was reported that all commercial activity had virtually ceased, that the inhabitants were suffering severe privations, and that a reign of terror prevailed. The deportations in that department were placed at several thousands. In Lille alone, it was said, men, women, and children were snatched from their homes and taken to unknown destinations. Among the restrictions noted were the following: People were not permitted to walk abroad after eight o'clock in the evening or to have a light. No one could carry a package of any sort or exchange correspondence even within the limits of the city, the posts being exclusively reserved for the Germans. Business could not be carried on except under German control and all the factories other than those used by the invaders for war purposes were closed. In some

of the establishments in the outskirts workmen were led to work at the point of the bayonet. Householders were required to bring to the officer in command all their metal utensils. But for the provisions distributed by the Spanish-American Committee and certain aid rendered by the Dutch Committee, the population would have been without means of subsistence. Meat had completely given out and it was forbidden to slaughter any animal, even an old horse. All the horses that remained had to be brought for inspection in good condition under the penalty of a high fine, despite the scarcity of forage. Every inhabitant, rich as well as poor, was required to have a provision card. Without waiting for peace, the French government made preparations to restore normal conditions as soon as possible in the regions occupied by the Germans. It sent out circular letters to the prefects of the invaded departments, declaring that everything must be done at the earliest possible moment for the reestablishment of normal conditions, and all questions pertaining to that end should be studied in advance, and a commission was appointed by the government under the presidency of M. Léon Bourgeois, former member of the cabinet. Plans were considered for providing for the return of the refugees after the enemy had left the territory, for the sending of portable houses into the devastated regions in the North, and for provisioning after the war. A central bureau was established at Paris, and the ministry of commerce was to have charge of the measures for the restoration of industrial conditions.

**THE GERMAN REPLY.** The charges in regard to the deportations were embodied in the French foreign ministry in a pamphlet entitled *The Germans at Lille and in the North of France*. The German reply, reported in the newspapers as official, characterized the charges as slanderous. It declared that although the deportation of some 20,000 inhabitants of Lille, Tourcoing, and Roubaix had taken place in the latter part of April the French government, though it must have known of it from the first, had waited three months before taking any stand in the matter. The German defense gave the following account of the measure: In those three populous towns there was increasing difficulty of feeding the inhabitants, despite the work of the Spanish-American Relief Committee. Foodstuffs from Germany could not be distributed in sufficient quantities on account of the illegal British blockade. Moreover, there was no knowing how long American supplies would be allowed by the British to enter. A drastic course was therefore necessary. A proclamation was issued giving the reasons, and saying that the people were to be taken into the interior, far from the front, were to be employed at farmwork, not on work of any military character, were to receive pay, and were to be guaranteed their sustenance. The towns were full of people out of work; the rural regions were suffering for lack of labor, and labor was indispensable to insure the harvest. Due regard was paid to exemptions. Young girls were not deported unless they were accustomed to earn their own living by work. Delegates of the Red Cross were present at the selection. It further went on to say that the majority of those who were deported appeared, from their own statements, to be by no means dissatisfied with their condition. It declared

that the measure was justified from the point of view of international law by Article 43 of the "Regulations Respecting the Laws and Customs of War on Land," adopted by the Hague Convention, declaring that the occupying authority should "take all the measures in its power to restore and insure so far as possible public order and safety."

**THE ARREST OF ROCHETTE.** Late in the autumn it was announced that Henri Rochette, the notorious financier, convicted of crooked dealings in 1912, and since then a fugitive from justice, was arrested at Granville, where he was serving in the automobile reserve of the army. From the time when he disappeared from Paris, Dec. 19, 1912, the constant efforts of the police to trace him had been fruitless, though the search was carried on in all parts of the world. It turned out that he had been in France ever since the beginning of the war. The circumstances were as follows: In August, 1914, when the war fever was at its height, M. Hervé, editor of the *Victoire*, turned the office of his newspaper into a sort of haven for fugitives of all kinds, chiefly foreigners caught in Paris and in danger of arrest, merely because they were foreigners. Among them also were many who had had difficulties with the law and wished to rehabilitate themselves by joining the army. This could be done only by fraud, but M. Hervé, believing the end justified the means, collected papers of honorable discharge from his friends and acquaintances and distributed them among these ex-convicts. One day a man of military age presented himself and asked humbly for similar aid. He confessed he was Henri Rochette, that he had been in a place of safety, but that on seeing France invaded he had wished to fight in her defense. He hoped some day, he said, to prove that he had been misjudged. M. Hervé secured from his colleague M. Georges Bienaimé his discharge papers and gave them to Rochette, who enlisted as a motor cyclist on Aug. 16, 1914, and was afterwards promoted to the general automobile reserve and stationed at Granville. There he was arrested by the authorities, and having admitted his identity was taken to the police station at Rouen. All this was freely admitted by M. Hervé, who defended his course, and laughed at the threat of certain newspapers that he would find himself under sentence to hard labor for falsifying the public records. He was condemned by many writers in the press, who also insisted on applying the law in all its rigor to Rochette. They refused to see anything courageous in Rochette's course and attributed the attitude of his defenders to the sentimentality always occasioned by a spectacular criminal. On the other hand, many agreed with M. Hervé. Aside from the question of moral blame, it was argued that the charge of forgery would not stand in law, because according to the penal code and the decisions of the courts the crime of forgery presupposed a design to injure, and there had not been, either on the part of Rochette or on that of his abettors, any sign of such intention.

**WAR FINANCE.** A summary of financial conditions during the year will be found in the article **FINANCIAL REVIEW**, paragraph *France*. In the session of the Chamber on December 11th, M. Ribot, Minister of Finance, presented some interesting aspects and comparisons of the financial measures of the war. In the first place he

attributed to the confidence of the country the fact that now in the 29th month of the war the finances were in sound condition. He gave the following summary: France had borrowed about 49 milliards of which 23½ constituted a consolidated debt. Great Britain had borrowed 70 milliards and he believed that Germany had borrowed fully as much. The actual figures for the last loan were 11,508,000,000 francs. The proportion of currency was 54.62 per cent. The short term debt, but not to be paid till after the war, came to 13 milliards, including the debt to the Bank of France. The floating debt on November 30th was not more than 12 milliards, as compared with the British debt of 27 to 28 milliards. The government had not only been able to meet its interest obligations, but to make its stipulated payments and take measures to maintain the rate of exchange. In this it had received the invaluable support of the Bank of France, which on November 19th had received 1,948,000,000 francs in gold and had expended an equal amount. He declared, however, the need of very vigorous measures for the organization and stimulation of production and the recourse to new taxes. He complained of expenses imposed by Parliament and counseled that body to confine itself to the rôle of control and economy. When its taxes should be presented he feared each one would encounter objections in Parliament and said he wished the government could impose taxes by decree. In reply to some criticism on this score he said the Chamber complained that there was not enough concentration of power in the government. He referred to the loss of time in the discussion and defense of every tax measure in Parliament. He believed in the reform of the government but thought also that the Chamber might do well also to reform its own procedure in some respects.

The extension of the moratorium for three months was decreed on September 20th, and again on December 20th for the three months dating from Jan. 1, 1917.

**FURTHER CRITICISM OF THE GOVERNMENT.** During November the demand for a more vigorous and centralized administration, both civil and military, was at length made openly, and a campaign to that end was conducted in the press. Owing to the censorship the precise grounds of criticism were not generally known, the language on that subject being very vague. Nor were the reforms aimed at described in detail. The newspapers and reviews confined themselves to demanding that the principle "of authority and unity" should be applied, that the best men should be called to the country's service without regard to petty political jealousies, that henceforth there should be perfect frankness toward the nation in regard to the state of affairs, that each nation of the Entente should consolidate its particular government, and that the Entente as a whole should have in its turn a compact central organization which should control all its members.

**PARLIAMENTARY DISCUSSION.** Parliament discussed measures of governmental reorganizations in 10 secret sessions beginning on November 28th. The first open session afterward brought to light some important features of the situation. In the first place, while in the month of June the opposition to the ministry numbered only 97 it had now reached 160 and, in addition, there were a number of other malcontents, so

that it may be estimated that the opposition had doubled in six months. The first question before the Chamber was that of confidence. M. Briand demanded that a resolution expressing confidence in all the acts of the government should be passed. In the discussion that followed there was some sharp criticism and some recommendations whose purport was not generally understood. One of the Unified Socialists, for example, demanded that the impression that Germany was not responsible if the war were prolonged should be removed, and he said that an international organization ought to be established with means of regulating conflicts between the nations, and that before this tribunal any matters of a nature that tended needlessly to prolong the war should be discussed. Another member said the government had nourished the country on illusions and dosed it with chloroform; that it had taken disquieting but ineffective measures; that its lack of foresight had paralyzed activity, especially in the East. He said that France had found herself in a situation as regards Greece (q.v.) which, to say the least, did not advance her prestige. He wanted to know why, when the government had promised the reorganization of the command-in-chief five months ago, it had done nothing on its own account. He twitted the Prime Minister with promising to centralize the government, when it was he who had the idea of a government of 22 members, and he wanted to know how one could expect anything of such inconsistent methods. He concluded with a demand for a complete change of method—in short, for a war government. Another member remarked that in the 29th month of the war, it would be a serious error to let the country think that certain mistakes had been the result of circumstances, for they were in fact due to errors which could have been avoided and which there was still time to repair: namely, lack of organization and foresight, resulting in delay or hasty execution. He accused the government of deferring to Parliament in matters which ought to have been decided on its own responsibility. The government had merely made promises and compromises and it had constantly covered its wavering policy by excuses. Its characteristics were incompetence and lack of will power. The ministry found a defender in M. Millerand, former Minister of War, who warned the Chamber of the bad effect on public opinion that would follow the evidence of a rupture between the government and the Deputies after the long secret sessions. He voted for the ministry because he believed that recent events and the vigorous action of the British ministry (see *GREAT BRITAIN, History*) would impel the government to take such measures as the country required. He said that it was not admissible that vital measures, which had to do at present with the war and would have to do in future with the terms of peace, should be taken in the dark and without responsibility. Another member complained that only half-way measures had hitherto been taken; that when prompt action was necessary there had been deliberation. He held that it was necessary to centralize authority and decide rapidly. One member made the specific suggestion that Parliament should meet in National Assembly, to discuss questions relating to the war. A resolution demanding a fairer distribution of the military burden among the Entente

Allies on the ground that France was putting into the army 1 in 6 of her population, as against 1 in 10 for England, 1 in 11 for Italy, and 1 in 20 for Russia, was voted down, the government majority being 184. A resolution refusing confidence was voted down by 395 to 117. It was couched in the following terms: "The Chamber, facing the facts of the present situation, having witnessed the military, diplomatic, and economic consequences of a feeble and improvident governmental policy, and being resolved to realize the conditions of victory by means of such conduct of the war as corresponds to the efforts of the army and the country, passes to the order of the day." The vote of confidence was then taken and was carried by 346 to 160, 69 not voting. It read as follows: "The Chamber, taking action on the declarations of the government concerning the reorganization of the Command-in-chief, approving its resolve to concentrate under a centralized control the general conduct of the war and the economic organization of the country, trusting to it to obtain in complete harmony with the Allies common sacrifices and efforts recognized as indispensable for obtaining by redoubled energy a definite victory, passes to the order of the day."

**REORGANIZATION.** The chief features in the plan for the consolidation of the government were a change in the high command, the creation of a War Committee, and the reduction of the number of ministers with a view to more compact and centralized administration. The Chamber accepted the first two of these measures on December 7th and on December 9th a law was passed "for the concentration of powers, the simplification of the machinery of administration, and the subordination of all the services to the exigencies of national defense." On December 12th M. Briand announced these changes in the cabinet. A War Committee of five members was to be constituted as follows: Premier and minister for foreign affairs, Aristide Briand; finance, A. Ribot; war, Gen. H. Lyautey; marine, Rear-Admiral Lacaze; national industry, including munitions and transportation, Albert Thomas. In addition to these the other members of the cabinet were: Interior, L. J. Malvy; commerce and agriculture, E. Clémentel; public instruction, P. Painlevé; national subsistence, M. Herriot; colonies, G. Doumergue; justice and public works, R. Viviani. Thus the number of ministers was reduced from 22 to 11. Other important changes were the doing away with five ministers of state, without portfolios, the combining of ministries under single heads, and the calling in of technical experts and business men as deputy-secretaries.

**CHANGE IN THE HIGH COMMAND.** On December 13th the President signed a decree naming General Joffre "technical counsel of the government in regard to the direction of the war." By another decree the commander in chief of the armies of the north and northeast, Gen. Robert Nivelle, and the commander in chief in the Orient, General Sarrail, were made directly responsible to the War Office. By a third decree (December 26th) the President created General Joffre a Marshal of France, and by another on the following day revoked the decree appointing him "technical counsel," as well as the decree of the year before (Dec. 2, 1915) that had placed him in command of all the French armies except those in Morocco and the col-

onies. The office of marshal, of ancient date, was suppressed by the Convention in 1793 but was reestablished under the First Empire. The last marshal to be named, Marshal Lebeuf, was created by Napoleon III in 1870, but while no marshal had been named since 1870, the rank had not been formally suppressed. A law was passed on March 13, 1875, providing for the maintenance of this rank but requiring the passage of a further measure which should fix its conditions. This further measure was never submitted to Parliament. In the session of the Chamber on December 29th there was some criticism of the government on the score of the legality of the decree naming General Joffre marshal. A member, who was applauded by the deputies of the extreme Left, declared this measure wholly illegal. It was argued that the decree had been presented to the French public as requiring to be submitted to the Chamber for ratification, and that if the ratification were postponed General Joffre could not in the meanwhile be legally regarded as a marshal. A vote on a motion brought by one of the critics showed a majority for the government of 401 out of 496.

**COMMENT ON THE RECONSTRUCTION.** At every point in the reconstruction of the government the dissident minority raised objections. There was further criticism when the new cabinet appeared before Parliament on December 13th. M. Briand set forth the aims of the ministry. He said the ministry now comprised a war committee with full powers and capable of prompt decisions and that it would remain in permanent session after having taken the necessary technical advice on all things relating to the prosecution of the war. As to the civil mobilization in Germany, which had been held up as a model, he said that the French government would not force on the country severe measures that would be at the same time ineffective. It would, however, demand the opportunity of requisitioning civilians for the service of national defense, and the authority to regulate by decree the serious question of alcohol. It aimed at the suppression of alcohol in the entire country, and in the army as well. Then followed a discussion in which some sharp attacks were delivered against the ministry. One deputy declared the change in the military command had the effect of dispersing responsibility by placing two authorities side by side: the minister of war and the commander in chief. As to a closer relation with the Allies the government had not said a word. Another characterized the arrangement as a "bastard" and cumbersome solution, and since that was at the basis of the new ministry he urged the Chamber to vote it down. A Socialist deputy called for peace at any cost and demanded that the government should announce the actual objects for which France was fighting. The discussion was then shut off, and upon M. Briand's demand for a vote of confidence, the order of the day was carried by 314 against 165. In general, the attitude of the press toward the measures of centralization taken by the ministry was favorable, though somewhat inclined to criticism. It was evidently the view that such measures should have been taken long before. It was pointed out that ever since the period of mobilization there had been evidence of a lack of efficiency in the administrative machinery. Owing to the division of functions among so many rival services, the officers charged with the needs

of defense and maintenance moved slowly and seemed incapable of increasing their pace. M. Clémenceau, the sharpness of whose comments had caused the censorship to suppress issues of his journal, *L'Homme Enchaîné*, declared that France was not betrayed by traitors but by honest men, excellent and conscientious fathers of families, who thought they had fulfilled their entire duty when they filed a document or checked an initiative or impeded some good enterprise by red tape and restrictions. This class was all the more dangerous, said he, because it was so well meaning and so far above suspicion. The critics complained that from the first France had been bound and gagged by the administration. In times of peace they said the French bureaucracy had always shown a tendency to discourage personal initiative. It had thwarted any measures for the exploitation of mines in France and in Algeria, and the result was that France had to purchase its coal and minerals from abroad. The difficulty was that the same administration which served as a check in time of peace was now required to serve as a motive power in time of war. They criticised also the recent measures of paternalism, saying that the government, instead of making use of practical and intelligent business men in the management of the industries pertaining to the war, had turned them out and attempted to conduct these enterprises with men of their own choosing. They found too late that this was a failure, and after having stupidly banished the practical expert, they were now obliged to call him back again. The public, according to these critics, had no desire to revolutionize conditions, but did require an immediate and complete change, whereby new methods would be employed and political considerations would be cast into the background. This was not a time for replacing competent men by theorists chosen for political reasons. Moreover, they demanded that while the censorship should be maintained as regards military or diplomatic information, France should be permitted to think and speak freely. What they looked for in the new ministry was the will to make firm and prompt decisions, the choice of the right men for the work, and, finally, a proper degree of liberty for the expression of public opinion.

**GOVERNMENT BY DECREE.** Pursuant to the policy demanded by the Chamber, and promised in its programme, the government introduced on December 15th a bill demanding authority for proceeding in certain instances by means of decrees and without waiting for the consent of Parliament. The chief points in the bill were as follows: To the end of the war the government was to be authorized to decree in a ministerial council all measures that should be required by the necessities of national defense in regard to agricultural and industrial production, the equipment of ports, provisioning, public health, the recruiting of manual labor, and the sale and distribution of the means of subsistence; such decrees as required the incurring of loans were to be submitted within a week to the Chamber; and that for the violation of such decrees a penalty was to be fixed at not more than six months' imprisonment or a fine of not more than 10,000 francs. The debate that followed brought out some sharp comments from the opposition. There were cries of "A Dictatorship!" M. Briand replied to these attacks

that the government had simply carried out the wishes of the Chamber; that the Chamber had reproached the government for its lack of energy and had compared it with Germany and with certain of the Allied countries, to its disadvantage. The Chamber had said to the government, "Govern on your own responsibility and the Chamber will approve." There were urgent questions which could be settled promptly only by decree. It seemed extraordinary, therefore, that after telling the government to act, certain deputies should oppose that action as dictatorial. If it were necessary to have an act passed in every emergency, if the ministers must appear in the Chamber and answer all objections, it was obvious that the work could not be carried out with promptness and precision. The bill did not apply, he said, to anything not specified in it. No government, he declared, was possible in the present emergency unless it had the right to act promptly, and to oppose this course would check all measures of national defense. The Chamber voted by 308 against 187 to send the bill to a special commission which the Chamber would appoint.

An important measure was brought in for the removal of certain economic abuses by the president of the Commission on Public Economy. The chief point was that to this commission the Chamber should grant complete authority. Such a course was energetically opposed by M. Ribot, but it was carried by a vote of 431 against 69. In considering the vote of credit for the first quarter of 1917 a motion was made for suppressing the item for maintenance of the censorship. There were two motions before the Chamber in regard to the censorship. The first was for the suppression of the political censorship and the other for the suppression of it altogether. The former was carried by a large majority.

There was much division of opinion in the Chamber in regard to the government's new policy. M. Clémenceau referred to Louis Napoleon and the 2nd of December, and declared it a serious blow at parliamentary rule. The different political groups each had its own solution. For example, the Socialist leader, M. Renaudel, believed that the only salvation was a National Assembly. On the other hand, the friends of the government pointed out that it demanded no powers more extensive than it had already exercised at the beginning of the war when Parliament was not in session. They said that the government simply wanted to do what the British government could do under the Defense of the Realm Act. A special group of growing strength was organized for the purpose of openly combating the government under the name of the "National Action."

**IN THE SENATE.** The same question as to the efficacy of the recent changes was raised in the Senate on December 19th. One of the Senators, M. Bérenger, propounded the question whether the reorganization had been real or amounted only to a change in the personnel. He referred to the failures of the government in the past, especially in the East, where it did not seem as if sufficient measures had been taken for coordinating the work of the Allies. He said what the country needed was the concentration of civil and military powers, that the government should have at its head men who were resolute and prompt. The Premier in his reply repeated in

substance what he had already said, pointing to the inconsistency of certain critics who, after demanding a centralized government, cried out against a dictatorship as soon as the government took measures to that end. He declared, however, that he would reply with perfect frankness to any precise and clear question. Discussion followed in secret session.

**CIVIL MOBILIZATION.** At the close of the year Senator Bérenger introduced a bill for the civil mobilization and the organization of national manual labor in France and in the colonies which was based on the following principles: Since England had found it necessary to constitute a national committee on manual labor, and since Germany has organized a civil auxiliary service, there was reason to think that the need of some such measure was no less urgent in France. Its designs were, first, to increase the national production to the degree that was indispensable to the hastening of victory; second, to diminish French purchases abroad and as a result to improve the rate of exchange; third, to assure to France the maintenance of an economic army as the necessary condition of victory. The civil mobilization must include all citizens from 17 to 60 and should be carried out in connection with the departmental bureaus of employment, of which there are many examples, such as those at Nantes, Rennes, Marseilles, etc. The central bureau of employment, which was to be organized as a part of the Department of Labor, was to control the situation as between the departments. The jurisdiction of the civil courts and not the military was to apply to it, the argument for this being that the former courts in the absence of so large a portion of the male population at the front, had little to do and were near at hand. It was argued that the measure would admit of sending to the army many young men now engaged in factories and in services where men unfit for military duty could often be employed. This would result in the reinforcement of both the army at the front and of the economic army in the rear.

It was reported at the end of the year that a voluntary movement was taking place among civilians toward mobilization. The Minister of War, General Lyautey, declared that the longer the war went on, the more urgent were the needs of economy both at the front and at the rear, and that the government would accept coöperation from any quarter. Citizens were requested to move in this matter of their own accord. It was reported that all men exempted hitherto would be mobilized and that the services of boys over 13, but still under the military age, as well as of strangers living in France for a year or more, would be accepted. Many organizations of women were collaborating with the War Department and many women individually were doing office work without pay in order to relieve men that the military authorities could employ otherwise. In the different districts the military commanders informed the recruiting officers of the number of women needed and of the employment that would be given to them. The answers to these appeals were very numerous, and it was said that the women who replaced the men were discharging their tasks with great efficiency.

**FRENCH OPINION OF THE PEACE OVERTURES.** The German note of December 12th, proposing a conference for the discussion of the terms of

peace (see **WAR OF THE NATIONS**), was commented upon in France in a spirit of hostility, suspicion, and contempt, and there was but little evidence of a disposition to take it seriously. M. Briand, in the course of a speech in Parliament, warned the country against it as a clumsy trick. President Wilson's suggestion in the latter part of December that the belligerents on each side should make known the terms on which they insisted and so enlighten neutrals as to the actual purposes of the war, seemed in general to be disapproved, although many commented upon it in a friendly spirit and attributed high motives to an endeavor which, however, they regarded as inopportune, impracticable, and likely to benefit the Central Powers rather than the Allies. When Switzerland followed the example of the United States in asking the belligerents to declare their aims and to consent to a discussion of the terms of peace, there was a tendency in France to suspect joint action among neutrals in this matter, the Swiss note having said that the Swiss government had been for the past five weeks in consultation with the United States government on the subject. French comment pointed to a probable movement among neutrals under the influence of Germany to agitate for peace and hinted at an organized system of pressure to bring about the results aimed at by Germany.

**THE SUPPRESSION OF ALCOHOL.** No part of the ministerial programme, announced after the secret sessions by M. Briand, received more attention than the assertion that the government would ask for power to suppress the consumption of alcoholic liquors. When asked by one of the deputies whether he meant to include the army also, he replied that he meant it to apply to the entire country. There was some speculation as to whether he would carry this policy so far as to prevent production and exportation. In that case it was pointed out it would seriously damage the interests of a large class and put an end to a valuable trade. It was hoped that the war against alcohol would not be carried out in a ruthless spirit, but would be directed solely toward the suppression of consumption in France. Thus limited, the proposal met with general favor.

**OTHER EVENTS.** On April 7th the Chamber passed a law adjourning all elections to the Legislature and all departmental, cantonal elections till after the war. The unpopularity of M. Cailiaux caused his movements to be regarded with a good deal of suspicion. At the close of the year his presence at Rome was interpreted by many as an endeavor on his part to carry out a pacifist propaganda. It was rumored that he had recommended to Italy the policy of a separate peace on the part of Italy and France with Germany, urging that the last-named power was disposed to render generous terms in the circumstances. The French press commented with much severity on his alleged attempts. At the close of the year the members of the Radical and the Radical Socialist party met in the Federation of the Seine to determine measures of reorganization and to consider the present economic situation and the conduct of the war. In regard to the political situation, the Federation declared its approval of the administration of the committees of Parliament which had done so much to supply the troops with the necessary resources, and it protested against the plan of the

government for administering by decrees, on the ground that such a course would rob Parliament of its power of control and would violate the legal guarantees of citizens. It urged Parliament, therefore, while trying to bring about a vigorous conduct of the war, to have due regard to its own rights. **FRANCE**, JOSEPH I. Elected Republican United States Senator from Maryland, Nov. 7, 1916.

**FRANCESCA DA RIMINI**. See **MUSIC**, *Opera*.

**FRANCIS**, DAVID ROWLAND. An American merchant and former cabinet officer, appointed ambassador to Russia by President Wilson, to succeed George T. Marye, resigned. The nomination was confirmed March 6, 1916. Mr. Francis was mayor of St. Louis from 1885 to 1889, then Governor of Missouri for four years, and Secretary of the Interior under President Cleveland (1896-97). In 1904 he served as president of the Louisiana Purchase Centennial Exposition at St. Louis, and in other connections he had identified himself prominently with the public life of that city, and with its business.

**FRANCIS JOSEPH**. Emperor of Austria and King of Hungary, one of the most important figures in European politics for 67 years, died at the royal palace of Schönbrunn, in the outskirts of Vienna, Nov. 21, 1916. Up to within a few hours of his death he insisted on supervising state affairs, through his customary audience with the Prime Minister (von Koerber). Francis Joseph's reign was the longest in modern history, exceeding that of Queen Victoria by four and a half years. Louis XIV, though nominally king for 72 years, actually ruled for little more than 60.

It is interesting to compare and contrast the lives and reigns of those contemporaries, Victoria and Francis Joseph. Each sovereign was greatly beloved, in a peculiarly patriarchal way. But the Queen's one great personal sorrow was the loss of her consort, while the Emperor lived through an extraordinary series of family tragedies. His brother, who became Emperor Maximilian of Mexico at the behest of Louis Napoleon and against the advice of Francis Joseph, was executed at Queretaro, in the land he had gone to rule. His only son, Crown Prince Rudolph, met a violent death at his hunting lodge at Meyerling, and the mystery surrounding his end involved a scandal. His wife, the Empress Elizabeth, whom he had married in 1855, was the youngest daughter of Duke Maximilian of Bavaria. She was a benevolent, gracious, and unpretentious woman, who, though reconciled to her husband after an estrangement resulting from his manner of life, shunned the ceremonial of the Viennese court. In 1898 she was assassinated by an anarchist at Geneva, Switzerland. A favorite niece of the Emperor's was burned to death in the palace of Schönbrunn, and the Duchesse d'Alençon, a sister-in-law of whom he was fond, was a victim of the Charity Bazaar fire in Paris. Another sister-in-law, Maximilian's wife, went mad after her husband's death. As a climax to the tale of horrors, the heir to the throne, the Archduke Francis Ferdinand, nephew of the Emperor, was murdered with his wife at Serajevo, Bosnia, in July, 1914, a tragedy that precipitated the War of the Nations,

in the midst of which the aged monarch died. If to all these distressing events be added the dangerous wound received by Francis Joseph himself in 1853 when a fanatic Hungarian tried to kill him, and the death as an infant of one of his three daughters, it will not seem strange that many believe they have seen executed the vengeance years ago called down on the Emperor by the Countess Karolyi, whose son had been victimized for his connection with the Hungarian War of Liberation: "May heaven and hell blast your happiness! May your family be exterminated! May you be smitten in the persons of those you love best! May your children be brought to ruin and may your life be wrecked, and yet may you live on in lonely, unbroken, and horrible grief to tremble when you recall the name of Karolyi."

Public calamity and private distress were mingled in Francis Joseph's life. Again in contrast to Queen Victoria, he entered wars that resulted in national humiliation and loss, instead of in increased imperial prestige. The Empire, instead of becoming welded together, seemed to be ever on the point of falling to pieces, held together only by the almost universal regard for the emperor. Despite the more liberal policy pursued after disastrous conflicts with France, Italy, and Germany had rendered imperative concessions that would placate discontent at home, one or another of the diverse elements of the national life was always in a state of rebellion, open or smothered. Francis Joseph grew to understand his people, or peoples, and they grew to understand him. He became an astute ruler and statesman, but he made costly mistakes, among which his last, the ultimatum to Serbia, is likely to be regarded as the most colossal.

Born Aug. 18, 1830, at Laxenburg Castle, near Vienna, Francis Joseph had in the Archduchess Sophia a severe mother whose chief interest was the Church. His father, Archduke Francis Charles, was a younger son of Emperor Francis I. As a boy he learned to speak the languages of the 17 different nationalities under Austrian rule. When he ascended the throne, at the age of 18, after his uncle, Emperor Ferdinand, had abdicated in his favor, he had been under the tutelage of the famous Metternich, and for years all his public acts reflected that imperialistic statesman's ideas. The young ruler was crowned in the midst of a national crisis. Revolts had forced Ferdinand to abdicate and Metternich to flee. Then Francis Charles waived his claims, and Francis Joseph was emperor. He had already fought in Italy under Field Marshal Radetzky—Italy, which was destined to be a kind of Nemesis for Austria. Altogether, at one time and another, the Hapsburgs lost Venetia, Lombardy, Parma, Modena, Tuscany, and Naples. After a hard-won victory over revolting Italian provinces in the very first year of his reign, the Emperor had to direct his attention to Hungary, where the formidable revolution headed by Louis Kossuth was only put down by Russian aid. As punishment, Hungary was absorbed into the Empire, deprived of constitutional liberties, and subjected to cruel retaliatory measures. It was not till 1867, when Francis Joseph and Elizabeth were crowned King and Queen of Hungary at Budapest, that a formal reconciliation took place. Afterward the Hungarians showed remarkable

personal loyalty to their ruler. In 1854 Austria refused to support Russia in the Crimean War; vengeance for this desertion came in 1866 when, in the Seven Weeks' War, which cost Austria her place in the German Confederation and control over several German duchies, Russia gave encouragement to Bismarck and Prussia. Only two years before, Bismarck had forced Austria into war against Denmark over Schleswig-Holstein, and a few years earlier (1859), Napoleon III had deliberately provoked a war with Austria to aid Mazzini in liberating northern Italian states from Hapsburg domination. Although Francis Joseph came out of this series of wars depleted in possessions, he had gained a kind of prestige through endurance. Moreover, he refused to side with France against Germany in 1870. Therefore, in 1878, at the Congress of Berlin, Bismarck saw to it that Bosnia and Herzegovina were turned over to the military protection of Austria; and when, in 1908, largely through the insistence of the Archduke Francis Ferdinand, Austria boldly annexed these countries, Germany stood beside her to meet the protests of the Entente. After the outbreak of the great war, the Triple Alliance resolved itself into a Dual Alliance, for Italy, refusing to be held by a merely formal bond, ranged herself with the Entente.

It would seem to be an evidence of the remarkable vitality of Francis Joseph that the strain of the European war did not tell on him sooner, especially as he became involved in a controversy with the Emperor William over military policies and peace negotiations. It was announced in January, 1915, that he was about to abdicate. Later it was decided that the Archduke Charles Francis Joseph, his grandnephew and heir (now Charles I, q.v.) would become co-regent in December, 1916. In his old age, two daughters were left to the Emperor—Gisela, married to Prince Leopold of Bavaria, and Marie Valerie, called the "Child of Peace" and her parents' favorite, the wife of the Archduke Francis Salvator.

Up to the end, Francis Joseph tried to perform the public obligations that were attendant on the prosecution of the great war. While reviewing troops in July, 1916, he caught a chill, and to this is traced the lung trouble which became acute four months later and resulted fatally. After his death, the Emperor's body, clad in the uniform of a Field Marshal, lay in state in the Hofburg Chapel for several days. On November 30th, it was transferred with impressive ceremony to St. Stephen's Cathedral, where the new Emperor and Empress, the Kings of Bulgaria, Bavaria, Württemberg, and Saxony, a hundred other members of royalty, five cardinals, and ten bishops participated in the funeral services. It was reported that the Emperor William was prevented by throat trouble from being present. The body of Francis Joseph was interred in the crypt of the church of the Capuchin monks. **FRENCH CONGO.** The former name of French Equatorial Africa (q. v.).

**FRENCH EQUATORIAL AFRICA** (formerly French Congo). A French possession in equatorial Africa, on the west coast, between the German Kamerun and the Belgian Congo; composed of the Gabun Colony (capital, Libreville), the Middle Congo Colony (Brazzaville), and the Ubangi-Shari-Chad Colony (Bangui). From the old area of 669,280 square miles must be deducted, roughly, 170,270 square miles ceded under the convention of Nov. 14, 1911, to Germany by France; and to it must be added about 6450 square miles ceded to France by Germany from the Kamerun. The area ceded to Germany carries a population of about 1,000,000 out of the original 10,000,000 (the estimated population in 1906). These estimates of population are probably much too high. French acquisition began on the Gabun River in 1841. The products and exports are rubber, ivory, timber, palm kernels and oil, cacao, etc. Gold, copper, and iron are mined. Imports (1913), 21,181,678 francs; exports, 36,665,037 (11,119,319 and 17,453,933 in 1909). Expenditure of France for 1914, 10,420,505 francs. General budget, 7,000,000 francs; loan fund, 4,329,917. The country is unhealthy, and sleeping sickness has made great inroads on the native population.

**FRENCH ESTABLISHMENTS IN OCEANIA.** A French colony in the South Pacific, consisting of widely scattered groups and single islands. The most important island is Tahiti. Area (estimated), 3998 square kilometers; population, 31,477. Capital, Papeete (3617 inhabitants), in Tahiti. Imports and exports (1913), 9,030,474 and 11,554,507 francs respectively. The coast land of Tahiti is fertile and grows tropical fruits and vegetables.

**FRENCH GUIANA (CAYENNE).** A French colony and penal settlement on the northern coast of South America, acquired in 1626. The area is 88,240 square kilometers (34,069 square miles); population in 1911, about 49,000. Cayenne, the chief town and only seaport, has about 13,500 inhabitants. Gold-mining (placer) is the chief occupation of the people. Imports and exports in 1913 were valued at 12,494,765 and 12,222,537 francs respectively. Of the value of the exports, about five-sixths is gold. The penal population included, Dec. 31, 1914, 4478 transported and 13 undergoing reclusion; 3003 *relegués* and 1199 freed.

**FRENCH GUINEA.** A French West African colony lying on the coast between Portuguese Guinea and Sierra Leone (British). Capital, Konakry, with 6623 inhabitants; Kankan is the chief commercial centre. There is a railway from Konakry to Kouroussa (588 kilometers). A branch to Kankan was completed in 1914. Rubber is the principal export, and is gathered over all the colony; but the principal sources are the Futa-Jallon, the Farana region, and certain circles of Upper Guinea. Rice is grown, and grazing is widely practiced. In 1914 there were in the colony 400,000 cattle, 150,000 sheep, 140,000 goats, and 3000 horses.

The budget for 1916 balanced at 6,827,400 francs. See FRENCH WEST AFRICA.

**FRENCH INDIA.** Five French dependencies in India, covering 513 square kilometers, with 273,530 inhabitants in 1914 as compared with 282,472 in 1911. The towns are Pondicherry (the capital), Karikal, Mahé, Chandernagor, and Yanam. The imports and exports (1914) were valued at 7,545,629 and 34,303,511 francs respectively. The chief exports are oil seeds, raw cotton, and pulse. Railway from Pondicherry to Villapuram and Peralam to Karakal, 30 kilometers. The local budget balanced for 1915 at 2,006,000 rupees; expenditure of France for 1915 was 1,230,000 francs. The debt stood Jan. 1, 1914, at 470,400 francs.

**FRENCH INDO-CHINA.** A French dependency in southeastern Asia, made up of five states and a strip of territory leased from China, as follows:

	Sq. kms.	Pop. 1911	Pop. 1906
Annam	159,890	5,542,822	5,518,681
Cambodia	175,450	1,487,948	1,193,534
Cochin-China	58,985	3,050,785	2,870,514
Laos	290,000	681,839	5,896,510
Tongking	119,750	6,117,954	668,727
Kwangchow-Wan*	1,000	158,881	177,097
Total	†808,055	16,990,229	16,315,063

\* Leased territory. † Square miles.

The country is under a governor-general, each state having a resident-general excepting Cochin-China which, being a colony, has a governor.

Hanoi (in Tongking) is the capital, with (1911) 113,676 inhabitants; Cholon had 191,665; Bin-Dinh, 75,000; Saigon, 72,000.

There are coal, lignite, and zinc mines. The chief product for export is rice (1,295,473 tons in 1914). Trade statistics are returned for the colony as a whole; in 1913 the imports were valued at 306,238,068 francs, and the exports at 345,259,253 francs. A British survey gives for 1914 £8,124,928 imports and £11,110,099 exports. The general budget balanced for 1914 at 35,585,300 piastres. Debt (Jan. 1, 1913), 345,913,000 francs. There is a military force of (1914) 10,861 European and 13,968 native troops.

**FRENCH LITERATURE.** Very little was published that was not directly or indirectly connected with the war. But the output of war books, which have, or claim to have, literary value, is enormous, and selection of such as ought to be recorded here is very difficult. Again, while the quality is often really quite high, nothing of supreme excellence could be named, *Gaspard* remains the book of the war. To the Prix Goncourt which was awarded to it at the end of 1915, the Academy has added the Grand Prix de Littérature in 1916.

**DRAMA.** Here the crop is meagre. *Plus haut que l'amour*, the first play of the novelist A. Couvreur, is a bewildering and sensational war play. H. Bataille's *Amazonne* has still to prove its success; it is the painful story of a girl of the invaded provinces, who, having seen her whole family slaughtered, gets into a state of patriotic frenzy which in the *milieu* where she has taken refuge (in Tours) proves to be contagious; and all sorts of harm come out of it. It may be deep psychologically, but this seems not to be the sort of literature people want. The play may fare as did Soulié's *1914 à 1937*, the story of a boy, an *enfant du crime* of a French woman of the invaded provinces, who

later, in 1937, finds his father, a German soldier of the great war, and strangles him: it did not please. Two decided hits were made, one by Wolff's exquisite short *Les deux gloires* and the other by *Le Poilu*, by Hennequin and Veber, music by Jacquet, a graceful vaudeville: a young soldier falls in love with his "marraine" just from reading the letters she sends to the trenches; complications arise, but all ends well. This gives the tone of the theatre: people want relaxation, and the managers have decided to offer this rather than the great patriotic plays of last winter. Nobody expects such plays as *Puces à l'oreille*, *Coralies et Cit*, *Tante d'Honfleur*, *Dindons*, etc. to live long. "Reprises" were organized of *Boubouroche*, *Poil de Carotte*; of a few patriotic plays as *Pour le Glaive*, *L'Espionne*, *La Tour de Nesle*; of Zola's *L'Assomoir*, evidently in connection with the idea of the French government to enforce prohibition of alcohol, except wine and beer; and of *Le Père Lebonnard* which vindicates the "bourgeois" so much attacked before the war. After the war an effort will be made to revive the *théâtre populaire*, where people in the provinces will act, as amateurs, plays of a moral and patriotic nature (such as Pottecher had established in Bussang); F. Brunot, the celebrated professor of the Sorbonne and the Mayor of the Eighteenth Arrondissement in Paris, has already written such a play, *La Défense de Schirmeck*, patriotic tableaux in reconquered Alsace (five acts). A good deal of attention has been paid to the theatres in the trenches (see Lortel, in *Revue intern. de Sociologie*, November, 1915). Among these plays we may mention *211 Revue*, by Dr. Voivenel, and *André Bataille, Plaies et . . . Boches*, full of vim. Boyer went to the front with his *roulotte*, or movable theatre which he used to take about from Montmartre to the Latin Quarter. Albert Carré, the Director of the Théâtre Français, wishing to remain at the front, has been replaced temporarily by E. Fabre. Mounet-Sully (q.v.), the venerable *doyen* of the Théâtre Française, died. Sarah Bernhardt and Yvette Guilbert appeared in American theatres. The Théâtre Français in New York, under the direction of Lucien Bonheur, has offered some good acting in a repertoire not always tactfully chosen.

**POETRY.** The present epic period inspires many poets. A few conspicuous collections are: Paul Fort, *Poèmes de la France*, *Bulletin lyrique des armées*; the author of *Ballades Françaises* handles the *vers libre* with as much subtlety and mastery as ever. H. Bataille, *La Divine Tragédie*; like Dante's *Divine Comedy*, it starts with the infernal realities (of the European war) to end, in the following volumes, with the song of victory. (This is the collection which contains the striking poem *Le Nouveau Christ*.) Paul Claudel's *Autres poèmes de guerre*; Francis Jammes, *Cinq prières pour temps de guerre*; Verhaeren, *Les ailes rouges de la guerre*; Zamaçois, *L'Ineffaçable, poèmes de guerre*—such names guarantee the quality of the poetry. Then a few single poems have attracted attention: Verhaeren, "A la Belgique, Contre l'Allemagne exterminatrice de Races" (*Revue Hebdomadaire*); F. Francis Porché, "L'Arrêt de la Marne, à la Mémoire de Ch. Péguy" (*Figaro*); Julien Vocance, "Cent visions de guerre" (*Grand Revue*); the Académie des Jeux floraux de Toulouse has awarded the Violette d'Or to G.

Champenois' "A la Gloire de l'Armée Française." The following all deserve a mention: H. Ghéon, *Foi en la France*; M. Pottecher, *Chants de la Tourmente*; Pierre Mille, *En croupe de Bellone*; G. Mourey, *Chant du Renouveau*; J. H. d'Artigues, *Heures de pourpres et d'ombres*; Gilles Normand, *Voix dans la Fournaise*; J. d'Estrain, *Les tristesses et les gloires*; N. Baudoin, *L'Offensive héroïque*; Spiers, *Et j'ai voulu la paix*; Allou, *Strophes d'Acier*; Roudrié, *La légende du poilu*; Banneret, *Cantique des morts*; B. de Roux, *Sonnets de Victoire*; L. Franc, *Chants devant les Barbares*; Figuières, *Clochers démolis*; Hauser, *La France sauvée*; Guerville, *Les Glorieux*; Trouillot, *Gavroche et Flambeau*; Trochu, *Poèmes de guerre*; Maréchal, *Vision de guerre*; Captain Mermet, *Une foi! Des amours, du sang*; Général Bruneau, *Voix dans l'ombre*. For Botrel, *Chansons de route* (53 songs, 34 with music, 112 drawings), see YEAR BOOK, 1915.

NOVELS. The posthumous *Centurion* by E. Psichari was published in the *Illustration* of Christmas last year with a noteworthy introduction by Bourget; it is a psychological autobiography of the young officer, very catholic in spirit. A real war-novel is M. Prévost's *Adjudant Benoit*; in Lorraine, Benoit finds that the father of his fiancée is a traitor to the French cause and he kills him, but leaving the girl in ignorance of the infamy; she herself is killed later by a shell. Paul Marguerite writes on *L'Embussqué*, a soldier who dodges his duty as a soldier and hides with a woman in Paris. Avèze tells the story of a spy, *Martha Steiner*, a governess who puts out the eyes of the father and has the boy entrusted to her killed. E. Mosely, in *Le Journal de Gottfried Mauser*, gives vent to anger at having been betrayed by trust in an unworthy nation. G. Leroux, in *Le château noir*, depicts in the weirdest manner the horrors of the war as conducted by barbarians; while F. de la Guérinière describes *La Kultur déchainée*. F. de Nion, in *Son sang pour l'Alsace*, writes about the conflicting duties which confront the Alsatian families that had partly adopted the German régime. Jean Corail, in *Les Centurions* continues the series of novels begun long before the war of the officers of the French colonies. Two volumes of stories of the trenches, *Nouveaux contes des tranchées*, and *Sous l'obus*, both by un "groupe de Poilus." The humorist G. de la Fouchardière writes an amusing book on *L'Araignée du Kaiser*. The two novels by Félicien Champsaur, *Mets en 1870*, and *Le Bandeau*, are disconcerting; the author seems to vindicate the German army and exonerate it for the "atrocities" which were held against it. One knows the part played in the war by aviators; two quite remarkable novels deal with this topic. J. H. Rosny, *Perdus!*, and P. Acker, *L'oiseau vainqueur*. Driant (Captain Danrit) reminds one of Jules Verne, in his *La guerre souterraine*. Three interesting products have children as heroes: F. Boutet, *Victor et ses amis*, trying to help in all sorts of ways the soldiers; A. Machaud, *La guerre des mômes*; A. Hermant, *L'autre aventure du joyeux garçon*, a young Englishman who comes to France before the war and dies during the war. Charles H. Hirsch has two novels, *Chacun son devoir*, a realistic and altogether unpleasant story of a one-eyed man who finally finds his usefulness during the war

in marrying the wife of a soldier killed in the trenches, and taking care of the family; *Mariée en 1914*, telling of the duty of the mothers to warn their children soon to be born against the hypocritical sentimentality of the Germans; they must not be deceived again. V. Goedorp, *Madame Crésus infirmière*, describes a miserable character redeemed through the war, but by the influence of a woman. Gyp, in her witty vein, has also her lesson to offer; in *Ceux de la Nuque* (by which she means those of the rear) she denounces the wealthy, especially women who live as if war were not spreading misery all over the world. Colette Yver takes up the same general idea in *Mystères des Béatitudes*, telling how the poor, in these days of great trial, find a vastly greater blessing in their humble but lofty duty than those who try to enjoy life in the worldly manner.

Some of the best writers have tried to take off the minds of the readers from the horrors of the war. Fr. Jammes's *Rosaire au soleil* is a touching story of a girl finding in religion her way of living a higher life; Gérard d'Houville, in *Jeune fille*, offers a delightful picture of a girl; and Madame Colette to get away from brutal humanity delights her readers by her account of *La paix chez les bêtes*. C. Roubeau, in *Morale Grise*, and H. Ardel, in *La chemin qui descend*, give very depressing novels which seem quite out of date. F. Maël's *L'île qui parle* is a novel of adventure. Others deserving mention are: Le Frapié, *Le capitaine Dupont*, five short stories; Avesnes, *La vocation* (Grand prix du Roman, 1916), a plea for more practical tests for the admission of students to the Naval Academy in France. The Académie Goncourt has awarded its 1914 prize to *Le Feu* by Barbusse, and of 1915 to *Appel du Sol* by A. Bertrand.

WAR PROSE. (A.) Of the philosophers of the war we endeavor to mention only the best: the following are mostly articles, now collected in book form: Verhaeren answers Romain Rolland's *Audessus de la Mêlée*, in the *Grande Revue*: "One must not take a scale in hands, when the enemy brandishes a sword." Jean Aicard, *Des cris dans la mêlée*; Jean Richepin, *Proses de guerre*; Paul Adam, *Dans l'air qui tremble*; Maeterlinck, *Débris de guerre*; Abbé Wetterlé, *Propos de guerre*; Ch. Maurras, *La France se sauve elle-même*; Michel Provins, *Ceux d'hier et ceux d'aujourd'hui*; P. Hamp, *Victoire de la France sur les Français*; Suard's *La nation et la race*; and Barre's *Amitié des tranchées*. Let us add here, Léon Daudet's *L'Hérédité, essai sur le drame intérieur*, a discussion of heredity, determinism, and other "scientific" theories, to which he opposes a gospel of moral energy, "la vie plus forte que la mort"; and A. Séché, *L'Oreille sur le cœur*, feeling the pulse of the present generation.

(B.) The following are actors of the war. The number of those who handle the sword and the pen equally well is remarkably great. The most famous book is *Lettres d'un soldat à sa mère*, prefaced by Chevillon, and which has been translated and widely read in America, telling how a man has been morally transformed by the war. Ch. Mallet, *Estampes et combats*; General Malleterre, *De la Marne à l'Yser, la victoire des forces morales* (died since); Captain Z., *L'armée de la guerre* (very striking); General Malleterre, *De la Marne à l'Yser, la*

ligne; Henry Bordeaux, *Derniers jours du Fort de Vaux*; P. Lintier, *Avec une batterie de 75, Ma pièce*; R. Benjamin (author of *Gaspard*), *La guerre sous le ciel de France*; Captain Redier, *Méditations dans les tranchées*; Abbé Wetterlé, *Têtes de Boches*; Abbé Klein, *Les douleurs qui espèrent*; M. Dupont, *En campagne*; Lieutenant R. Deville, *Carnet de route d'un artilleur*; René Milan, *Vagabonds de la gloire*; he served as a sailor, and tells of his experiences until Salonica; Jean Variot (the author of *Hazard de la guerre*), *La crois des Carmes*, episodes of the war in Lorraine; M. Genevois, *Sous Verdun*; Roujon, *Carnets de Route*; J. Léry, *La bataille de la Forêt*, in Argonne; J. Renaud, *La tranchée rouge*. Then several volumes telling of the authors' experiences as prisoners of war in Germany: G. Riou (the author of *Aux écouttes de la France qui vient*), *Journal d'un simple soldat*; Abbé P. Aubry, *Ma captivité en Allemagne*; Ch. Hennebois, *Aux mains de l'Allemagne*—all three, very striking accounts. A book by itself is Hugues Le Roux, *Au champ d'honneur*, a diary about his son, killed in action. Finally we must mention the newspapers in the trenches; there are many; see a list in *Publications de la guerre*, Paris, 1916, and descriptions of some in *Grande Revue*, article by Bompard; or in the *Century Magazine*, October, 1916, by Gellert Burgess.

**HISTORY OF LITERATURE AND CRITICISM.** Even here the war influence is strongly felt. E. L. Kerdaniel, *Un soldat poète du XV<sup>m</sup> siècle*, *Meschinot*; A. Lefranc, *Un réformateur militaire au XVI<sup>m</sup> siècle*, *Raymond de Fourquevaux*. Then: A. Dorchain, *Etudes sur Pierre Corneille*; Joseph Dedieu, *Montesquieu*; P. M. Masson, two books on the religious ideas of Rousseau; Pierre Kohler, *Madame de Staël et la Suisse*; E. Faguet, *Mgr. Dupanloup*; Barthou, *Lamartine orateur*. About contemporaries: V. Bourdon, *Avec Ch. Péguy, de la Lorraine à la Marne*; H. Massis, *La vie d'E. Psichari*. *Anthologie des écrivains morts pour la patrie*, preface by Barrès. An anonymous satire against M. Barrès, *Le jardin de Marrès, par Bérénice*—about the speaking and abundant writing of Barrès as contrasted with the action of the men at the front. H. Brémont publishes an *Histoire du sentiment religieux en France depuis la fin des guerres religieuses jusqu' à nos jours*, and R. Valléry-Radot an *Anthologie de la poésie catholique de Villon à nos jours*, with a preface by Claudel, saying: "Who would suspect, in reading Rabelais, Montaigne, Racine, Molière, Victor Hugo, that a God died for us on the cross. This must stop." A. Mary offers an interesting collection of *Maximes des grands capitaines français*. Larousse publishes a *Dictionnaire des termes militaires et de l'argot poilu*; and Sainéan, *L'argot des tranchées*.

**LITERARY EVENTS.** R. Benjamin was awarded the Grand Prix de Littérature. Le Goffic, author of *Diemude*, and of *Bourguignottes et Pompons rouges*, the Prix Lasserre.—The dead of the year are: Ch. Poimarols, the Christian poet; F. Charmes (q.v.) of the French Academy, and editor of the *Revue des Deux Mondes* (where he was replaced by Doumic); A. Filon, the critic; E. Faguet, Marquis de Ségur, and Marquis de Vogtli (qq.v.) all three of the Academy; Emile Verhaeren (q.v.), killed while boarding a train at Rouen. Dead on the field of honor: Lieutenant-Colonel Driant (Danrit);

E. Clermont, author of *Laure*; E. Bourcier; Henri Bachelin; E. Henriot; R. Vincent; E. Nolent; L. Boyer; P. M. Masson; the following poets: E. Despax, L. Rolmer, J. Gravier, Ch. Crécy, A. Dumange, L. Gignoux.

**FRENCH PHILOLOGY.** See PHILOLOGY, MODERN.

**FRENCH SOMALI COAST.** A French protectorate on the Gulf of Aden, lying between Eritrea and British Somaliland. Official report gives area 120,000 square kilometers, and population (1911) 213,000. Jibuti, the capital, has about 17,000 inhabitants. Imports (1914), 28,692,145 francs (chiefly cotton goods, butter, sugar, galvanized iron); exports, 43,643,215 (chiefly coffee, ivory, hides and skins). The local budget for 1915 balanced at 2,150,000 francs. The trade with Abyssinia, which formerly passed through Zaila, now goes through Jibuti by rail to Diré Dawa.

**FRENCH WEST AFRICA.** A French government-general with headquarters at Dakar (since 1902), created by the decree of June 16, 1895; M. Chautemps being the colonial minister. By the decree of Oct. 29, 1904, French West Africa was defined as including five colonies, the Niger territory being comprehended in the colony of Upper Senegal and Niger, and the civil territory of Mauritania. By the decree of Sept. 7, 1911, to take effect Jan. 1, 1912, the Niger territory was separated from Upper Senegal and Niger colony and became an administrative subdivision known as the Military Territory of the Niger, under a commandant. Estimated area and population as follows:

	Sq. km.	Pop.
Senegal .....	191,600	1,247,096
French Guinea .....	239,000	1,927,000
Ivory Coast .....	325,200	1,265,000
Dahomey .....	107,000	902,000
Upper Senegal and Niger....	782,700	6,085,000
Mil. Ter. of the Niger .....	1,883,700	
Mauritania .....	898,700	250,000
Total .....	* 3,922,000	11,626,000

\* 1,514,632 square miles.

St. Louis (Senegal) has 23,300 inhabitants, Dakar (the government headquarters), 23,833; Konakry is the capital of French Guinea, Bingerville of the Ivory Coast, Porto Novo of Dahomey, Bamako of Upper Senegal and Niger.

The total value of all imports for 1913 was 151,574,000 francs; of this total, imports valued at 66,547,000 francs came from France. Total exports, 126,144,000 francs; of which, exports valued at 66,349,000 francs were received by France. The total debt stood Jan. 1, 1912, at 156,277,336 francs. The French budget for 1914 estimates an expenditure for French West Africa of 24,522,030 francs, largely for military purposes. General colonial budget 1916, 24,360,000 francs. A force of 13,500 men is maintained, of whom 1500 are Europeans.

**FREUD, SIGMUND.** See PSYCHOLOGY, *Psychotherapy*.

**FRIENDS, RELIGIOUS SOCIETY OF.** There are four branches of this denomination: the Orthodox, Liberal (Hicksite), Wilburite, and Primitive. The Orthodox body is the most numerous. It has, according to the latest statistics (1915) 97,876 members, 1315 ministers, and 775 meeting houses. The Hicksite or Liberal branch has 18,381 members, 99 ministers,

and 211 meeting houses; the Wilburite branch, about 3880 members, 47 ministers, and 48 meeting houses; the Primitive, about 171 members, 10 ministers, and 8 meeting-houses. The Five Years' Meeting is the central organization of the Orthodox body. It includes 13 yearly meetings. The Friends' General Conference includes the seven yearly meetings of the Hicksite body. Both have shown considerable activity in recent years. Summer schools are held and Woolman House, a Friends' School for Social and Religious Education was established at Swarthmore, Pa., in 1915. All branches of Friends are uniting in the propaganda of their peace principles.

**FRUG, SIMON.** See JEWS AND JUDAISM, *Literary Events*.

**FRUIT PRODUCTION.** See HORTICULTURE.

**FUEL.** See BOILERS; CHEMISTRY, INDUSTRIAL; COAL; PETROLEUM.

**FUR-BEARING ANIMALS.** See ALASKA.

**FUTURISM.** See ITALIAN LITERATURE; PAINTING AND SCULPTURE.

**GALICIA.** An Austrian crownland, bounded by Russian Poland on the north and Russia on the northeast and east, and on the southwest separated by the Carpathian Mountains from Hungary. Galicia formed a part of Poland from the fourteenth century until 1772, the year of the first Polish partition. Galicia is by far the largest of the Austrian crownlands, covering an area of 30,308 square miles, which is slightly smaller than the State of South Carolina. Population at the census of Dec. 31, 1910, 8,025,675, compared with 7,315,939 in 1900. The natural increase in the decade was 1,198,279 and the net emigration 488,543. Of the inhabitants in 1910, 7,112,574 (88.61 per cent) were returned as Catholics (including those of the Roman, Greek, and Armenian rites); Jews, 871,895 (10.86 per cent); Evangelicals, 37,144 (0.46); adherents of the Orthodox Church, 2845 (0.05). The number of Austrian subjects in 1910 was 7,980,477; Polish was the vernacular of 4,672,500 (58.55 per cent) of these; Ruthenian, 3,208,092 (40.20); German, 90,144 (1.13). About 93 per cent of the Austrian Poles and 91 per cent of the Austrian Ruthenians are inhabitants of Galicia. Of the population in 1910, those dependent on agriculture constituted about 73.0 per cent; industry and the trades, 9.5 per cent; commerce and transportation, 9.6 per cent; public and military service, 7.9 per cent. The capital of Galicia is Lemberg, the seat of one of the eight Austrian universities; its population at the 1910 census was 206,113. The other larger towns are: Cracow, 154,141; Przemyśl, 54,078; Kolomea, 42,676; Tarnów, 36,731; Drohobycz, 34,665; Tarnopol, 33,871; Stanislaw, 33,328; Stryj, 30,895; Neusandez, 25,004; Jaroslau, 23,965; Rzeszów, 23,688; Podgórze, 22,322; Knihinin Wies, 22,143; Sambor, 20,257; Brody, 18,055; Boryslaw, 15,145; Buczacz, 14,286. See WAR OF THE NATIONS.

**GALLI-CURCI, AMELITA.** See MUSIC, *Opera*.

**GALLIENI, JOSEPH SIMON.** A French general, died at the military hospital at Versailles, May 27, 1916. He was born at St. B at April 24, 1849, graduated in 1868 from the military academy of St. Cyr, and as a lieutenant fought in the Franco-Prussian War. With Commandant Lambert, he was one of the small group of men who met the Bavarians and opposed them heroically at a house since called

"La derni re cartouche" ("The Last Cartridge"), from a famous painting made by Alphonse de Neuville. By 1878 Gallieni had become captain, and two years later he was sent to reestablish relations between France and Ahmadou, Sultan of Segou. Although threatened with death constantly during a captivity of eight months, he kept at his task and finally gained a grant for his country of exclusive commercial privileges with the Upper Niger. This feat brought him a lieutenant-colonelcy and his explorations earned him the gold medal of the Geographical Society. Later he was stationed at Brest, and next was ordered to Tongking. His promotion to general was the reward for his services in commanding and pacifying the second military territory of Indo-China. In 1896 the colony of Madagascar had just been acquired by France; Gallieni, recognized as its conqueror, was commissioned to remain there as governor-general, to depose Queen Ranavalao and restore order. His tenure of office, lasting until 1905, was marked by a notable piece of constructive work. He put down several revolts, and gained wide recognition for his success in handling the natives. Subsequently he served on various stations, as an inspector of troops, as commander of the thirteenth army corps, as military governor of Lyons, etc. By 1908 he had become a member of the Superior War Council.

However, General Gallieni will be best remembered for his part in the European war. On Aug. 27, 1914, when the German General von Kluck's great drive menaced Paris, Gallieni was appointed military governor of the city. He announced, "I have received the mission of defending Paris against the invader. I shall accomplish that mission to the end." It has been stated that General Joffre foresaw that the Germans, on approaching the French capital, would attempt to encircle the city; that therefore a chance would be afforded for a picked body of men to sally out and cut the lines of communication in such a way as to capture von Kluck. Before the time for this move came, however, General Manoury sent in word that he was hard pressed in his position north of Paris, and Gallieni rushed the reserved troops to his relief. This led, eventually, to the check which ended by the Germans being pressed back to the Marne, so that Gallieni has been credited with his rightful share in the victory—in fact, he gained the name "savior of Paris." He had made of the city an armed camp, and in the most effective way provided for its defense. For 14 months he remained at his post of governor, at the end of that time entering the reorganized French cabinet as Minister of War. Here, also, he made a notable record for efficiency, brushing aside red tape, and bringing the personnel of officers to a high point. In February, 1916, he added to his other duties supervision of the Department of Aviation, but the next month ill health forced his retirement. He was accorded an impressive military funeral.

**GALLY, MERRITT.** An American inventor, died March 7, 1916, in Brooklyn, N. Y. Born in 1838 at Perry, N. Y., and educated at the University of Rochester (A.B., 1863) and at Auburn Theological Seminary, he was for several years a Presbyterian minister. Throat trouble compelled him to give up this profession, and he turned to the perfecting of mechanical devices. Among his inventions were the Uni-

versal job press for artistic printing (1860), a linotype machine, patents for which were sold in 1872, a multiple telegraph system, and mechanism for telephone relays and repeaters. Altogether, he had taken out several hundred patents.

**GALSWORTHY, JOHN.** See DRAMA.

**GAMBIA.** A British West African colony on the river Gambia (area, 69 square miles), with a protectorate extending on both banks of the river for 250 miles from its mouth (about 4000 square miles). Capital, Bathurst. Population of St. Mary's Island, on which Bathurst is situated, 8807; of the protected districts, 152,000. The cultivation of peanuts is the principal industry. Imports (1914), £688,007; exports (1914), £926,127 (peanuts, 66,885 tons, valued at £650,461).

#### **GARBAGE AND REFUSE DISPOSAL.**

War conditions materially increased the revenue from garbage-reduction works during the year, owing to high prices for grease and for fertilizer-base tankage. This of course encouraged reduction as a means of disposal. Where garbage was mixed with other refuse and burned, instead of being treated separately in reduction works, the recent tendency was away from the British type of high-temperature destructors—with forced draft and heat utilization for producing electric light and power—and toward simpler forms of incinerators—with relatively low temperatures and little or no attempt to utilize the heat of combustion. This tendency may be only temporary, though the chances seem to be the other way, especially for the smaller cities. Feeding garbage to hogs continues in a number of cities while in others, "sanitary fills" or the use of garbage in layers, covered with clean ashes or earth, are being made, thus getting rid of these city wastes and raising the level of low-lying land at the same time.

New York City let a five-year garbage-disposal contract early in 1916 which will yield it a total of \$900,000. For garbage from the boroughs of Manhattan, the Bronx, and Brooklyn delivered by the city at various points on the water-front the contractor agreed to transport the garbage by water to reduction works of the Cobwell type located in the Borough of Richmond. Here grease was to be extracted and fertilizer tankage recovered for sale. Strenuous opposition was made by Staten Islanders to the location in their borough of works to treat the garbage from three other boroughs on the ground of alleged nuisance and general unfairness. An appeal was made to the Governor of New York and referred by him to the State Department of Health for investigation and report. The matter was pending at the close of 1916. Meanwhile the garbage of the city was being disposed of at the old Barren Island reduction works under another contract similar in general terms but which yielded the city less money.

A questionnaire raised on methods of collection and on haulage to the point of final disposal sent out by B. F. Miller, City Engineer, Meadville, Pa., brought returns from 125 cities and towns. Summarized (*Engineering News*, Nov. 23, 1916), these returns indicated a growing sentiment in favor of municipal rather than the generally prevailing contract system of collection and also a growing tendency to put this service in charge of the public-works instead of the public-health department. Motor trucks

were used for collecting and hauling garbage and refuse in some cities, but a large majority use horse-drawn vehicles. The replies indicated that as a rule motor trucks were not considered advantageous for ordinary house-to-house collection but that where the houses are widely separated, and also for long haul from central collecting stations to the point of final disposal, motor trucks are often advisable. Motor trucks might also be advantageous for taking garbage and refuse away from hotels and restaurants—on account of the large quantities involved.

Recognizing that the garbage and refuse problem was one for engineers to study with careful attention to a variety of conditions peculiar to each city, engineers experienced in the subject were employed to make investigations of needs of Washington, D. C., and of two relatively small cities in Illinois, Danville and Galesburg. In each case particular attention was given to the collection service which, with haulage to the point of final disposal, often cost more than disposal. The Washington study was made by Irwin S. Osborn, Cleveland, Ohio, and the two Illinois studies by Samuel A. Greeley, Chicago, Ill.

**GARDENING.** See HORTICULTURE.

**GARDEN PRODUCE.** See HORTICULTURE.

**GARDNER, FREDERICK D.** Elected Democratic Governor of Missouri, Nov. 7, 1916.

**GARNETT, JAMES MERCER.** An American educator and scholar, died in Baltimore, Feb. 18, 1916. He was born at Aldie, Va., in 1840, and graduated A.M. from the University of Virginia in 1859. During the Civil War he served in the Confederate army, rising to be captain of artillery, and after study at Berlin and Leipzig, returned to be principal of St. John's College, Annapolis, Md. (1870-80). From 1882 to 1896 he held the chair of English in the University of Virginia, and afterward for many years taught privately. At various times he was vice-president of the Modern Language Association of America, and president of the American Dialect Society and the American Philological Association. His writings deal with Old English literature; he also edited standard English works, as well as *Selections in English Prose* (1891).

**GARRETT, JOHN W.** An American diplomat, whose appointment as United States Minister to the Netherlands, to succeed Dr. Henry van Dyke, resigned, was announced Dec. 4, 1916. A resident of Baltimore, Mr. Garrett had previously been Minister to Argentina and after the beginning of the European war he went to Paris on a special mission for the State Department.

**GARY PLAN.** See EDUCATION IN THE UNITED STATES.

**GAS, NATURAL.** The natural gas industry of the country is one of steadily increasing importance. In spite of the demands that have been made on the reserves during the last 50 years, and the depletion of the supply in many localities, especially in Pennsylvania, Ohio, and Indiana, the total volume of natural gas produced and commercially utilized in 1915 exceeded all previous records, aggregating 628,578,842,000 cubic feet. The total market value of the production was \$101,312,381. West Virginia in 1915 produced the largest quantity, 244,400,159 million cubic feet. Pennsylvania was second, Oklahoma third, Ohio fourth.

Other States producing large quantities were Kansas, California, Louisiana, and Texas.

**GAS ENGINES.** See INTERNAL COMBUSTION ENGINES.

**GASES, ASPHYXIATING.** See CHEMISTRY, INDUSTRIAL, *Asphyxiating Gases*.

**GAS-FILLED LAMP.** See ELECTRIC LIGHTING.

**GASOLINE.** See AUTOMOBILES; CHEMISTRY, INDUSTRIAL; PETROLEUM.

**GASPARD.** See FRENCH LITERATURE.

**GEBEL.** See ARCHÆOLOGY.

**GEMS AND PRECIOUS STONES.** The total production of gems and precious stones in the United States in 1915 was valued at \$170,431, compared with a value of \$124,651 in 1914. Precious stones having the most value in 1915 were the sapphire, followed by agates, chalcedony, onyx, turquoise, turmaline, and jasper. Montana ranks first among all the States in the value of precious stones, a position which it has held for five years. The output consists chiefly of sapphires, which constituted almost one-half of the total value of all precious stones produced in the United States in 1915. California ranks second, Nevada third, and Colorado fourth. Diamond mining was carried on in Arkansas during the year, and 31 stones were found. These were white, yellowish, and brown. Three of the stones weighed .32, 1.22, and 2.5 carats respectively. Isolated diamonds were also found in various parts of California. The imports of precious stones in the United States in 1915 amounted to \$26,193,862. The imports of unset diamonds in 1915 amounted to \$13,169,998.

**GENETICS.** See ZOOLOGY, *Heredity*.

**GEOGRAPHICAL SOCIETY, AMERICAN.** A scientific society organized in 1852, with headquarters at Broadway and 156th Street, New York. During 1916 the society undertook to extend its activities along a number of different lines. It gave large support to the Crocker Land Expedition and inaugurated a series of special publications, of which one volume a year is to be issued. The first volume, entitled *The Andes of Southern Peru*, was published in December, 1916. In January, 1916, the *Bulletin* of the American Geographical Society was changed to the *Geographical Review*, a new magazine of broader scope and larger size, under the editorial management of Dr. Isaiah Bowman, Director of the Society. During 1916 about 30,000 persons attended the public exhibitions of the society, consisting of war maps and maps illustrating the economic geography of the world. The latest explorations were all shown on special maps directly after reports were received. By the end of 1916 the society had over 2500 fellows. The officers for 1916 were: President, John Greenough; vice-presidents, James B. Ford, Paul Tuckerman, Anton A. Raven; foreign corresponding secretary, Prof. William Libbey; domestic corresponding secretary, Archibald D. Russell; recording secretary, Hamilton Fish Kean; treasurer, Henry Parish, Jr.

**GEOGRAPHIC SOCIETY, NATIONAL.** The Society's work during the year included the publication of Dr. Hiram Bingham's survey of the results of the 1915 expedition to Peru and Prof. O. F. Cook's studies of the wonderful bo-

tanical aspects of the country, with other reports. The expedition unearthed a number of ancient highways, buried cities, and ruined temples, and showed that the region around Machu Picchu was perhaps the most densely populated country in the Western Hemisphere in pre-Columbian times.

The explorers found that the inhabitants, the Incas, made pottery resembling that of early Greece; performed surgical operations; and had wonderful staircase farms; that they laid stones weighing tons with the greatest nicety and domesticated some 80 species of plants, including potatoes and corn.

During 1916 Dr. Robert F. Griggs, whose expedition was financed by the Society, investigated Katmai Volcano and discovered the "Valley of the Ten Thousand Smokes." The whole of Vesuvius could almost be entombed in the crater of Katmai and the "Valley of the Ten Thousand Smokes" was found to be a geyser region surpassing even the Yellowstone.

In December the Society supplemented a Federal appropriation of \$50,000 by one of \$20,000 from its own treasury, to make up the \$70,000 necessary to acquire the privately owned sequoias in the Giant Forest of the Sequoia National Park, the first time that a national organization has thus cooperated with the Federal government to preserve the nation's scenic assets.

The membership of the Society, of which O. H. Tittman is president and Gilbert H. Grosvenor is Director and Editor, now exceeds 550,000, and is growing at the rate of 100,000 a year. The *National Geographic Magazine* is published monthly by the Society.

**GEOLOGY. GENERAL WORKS.** A review of the recent developments would be incomplete without making mention of works of popular character, like H. F. Osborn's *Man of the Old Stone Age* which gives an account of the available evidences bearing upon prehistoric man and his environment. It is a volume that will interest the more expert for its philosophic treatment and skillful analysis of the data. Its appearance is timely in view of the remarkable advance that has come about recently by reason of the discoveries of new material in England and on the continent of Europe, which have enabled anthropologists to bridge some of the gaps that previously existed in the line of man's ancestry. The author has arranged the stages of culture chronologically, placing values upon the intervals represented, but it should be noted that the arrangement is rather tentative and the time periods are to be freely interpreted.

A restatement of the planetesimal theory of Chamberlin under the title *The Origin of the Earth* aims to remove the difficulties in the way of a wider knowledge of the subject by curtailment of technical detail, and at the same time seeks to show the application of the theory to various departments of geology. In summary, Chamberlin's view is that the earth was formed by the infalling of small bodies of planetary matter about the "earth-knot"; the mass thus formed was subjected to gravitation adjustments from shrinkage, and to modifications from rotational acceleration and the pull of the moon. In present form the earth may be conceived as built up of six primary segments of conical shape. Two of the segments occupy the Pacific depression, two the Atlantic, and the remaining two the

Indian and Mediterranean-Black Sea region. There are other important features which can hardly be touched upon in this place. For a general treatise on the science of geology from a popular standpoint *The Earth, Its Life and Death* will be found valuable. It is the English version of the work by Berget of the Institut Océanographique de Paris.

**EARLY MAN IN AMERICA.** The question of man's origin in America has been brought once more to the fore by the discovery of human remains in association with Pleistocene fossils. The occurrence seems to be the most authentic of the kind that has been described up to the present. Previous evidence indicative of the early settlement of man in America—that is, as early as the closing stages of the Pleistocene, or the first part of the Stone Age—has lacked conviction, as in most instances there was reason to believe that the burials had not taken place in undisturbed ground and were later than the surroundings indicated. The preponderance of scientific opinion in this country seems to favor the view that man is a comparatively late immigrant, coming by the way of the Alaskan land bridge or by the South Sea Islands. The recent discovery was made by E. H. Sellards, State Geologist of Florida, near Vero in that State, where in the excavation of a canal a large number of fossil remains were uncovered. These included several parts of the human skeleton as well as those of the elephant, mammoth, giant sloth, horse, and other animals which lived in America during the Glacial Period, but have since become extinct. The stratum containing the remains consists of cross-bedded sands from 3 to 5 feet thick; it is capped by alluvial sand and muck, and rests upon marine shell marl. The bones occur all through the sand, and many are so fragile as to preclude the possibility of their having been washed into place. The human bones exhibit the same degree of mineralization as that of the associated fossils, and the overlying sand and muck are apparently in undisturbed condition. A few flints of very crude form have been found in the same material. Altogether the evidences seem favorable to a contemporaneous burial with the Pleistocene animals. No doubt the find will be given attention by anthropologists who will pass upon the character of the evidence and test the geological facts by those developed from study of the remains and the accompanying marks of human culture.

**STRATIGRAPHY.** A series of papers on the methods of stratigraphic correlation, published as a bulletin of the Geological Society of America represents perhaps the most complete and satisfactory exposition of this subject that has appeared up to the present. The problems involved, the methods of their treatment, and the limitations inherent in each method are set forth by E. O. Ulrich who sums up the matter with the conclusion that fossils are to be relied upon only for the identification of stratigraphic horizons, not for the division of geologic time in a broad way. The boundaries between epochs and periods are determinable only by those physical criteria that are involved in the vertical and horizontal movements of the earth's crust and that lead to a shifting of the border line between the water and the land. A geological age is regarded as terminating when the marine waters are largely or wholly withdrawn from the epicontinental basins, and the next age as opening

when the sea begins to advance again in the same basin or basins. This principle, the displacement of the strand lines, should be regarded as the main criterion for the determination of the natural divisions of geological time. Such displacement is accompanied by faunal changes; and frequently there is an unconformity between the bedding planes above and below. The value of fossil evidence in the subdivision of the record depends upon the closeness with which the biological characters and variations are discriminated; the more specialized the types used, the more reliable will be the results. Knowlton presents the subject from the standpoint of plant life, and W. D. Matthew describes the principles to be applied in the use of fossil vertebrates. Paleogeography in relation to correlation is discussed by C. Schuchert.

**PHYSIOGRAPHY.** A physiographic map of the United States is in course of preparation by a committee of the Association of American Geographers. The entire country is divided into 22 so-called physiographic provinces, with 80 smaller subdivisions or sections. A physiographic province is defined by the committee as an area that has had essentially the same geomorphological development, which means that it has undergone similar geological changes. As a groundwork for the study of physical geography the map should prove valuable. Its publication is to be undertaken as soon as possible.

E. Fischer presents an account of the effects of man in modifying the earth's features which he values as one of the leading factors. The mass of material moved each year in the production of ores, mineral fuels, and salt amounts to one cubic kilometer, whereas the entire industry of mining and quarrying accounts for twice that volume; and a further addition must be made for the earth and rock displaced in engineering and agricultural operations. The control of streams, the drainage of lake and swamp areas, the change of seasonal run-off, the denudation of forests, and the exploitation of groundwater resources represent some ways in which man interferes with physiographic processes. The influence of man, as that of natural agencies, is dominantly degradational.

Landslides as a method of degradation have been studied by D. H. Newland with especial reference to the gravity movements that take place in unconsolidated materials, like the sands and clays found in stream valleys. There are a number of different forms or types inclusive of surface creep, slumping and flows, earth avalanches, subsidence caused by lateral flowage of substratum, and subsidence accompanied by a reciprocal upward movement from unbalance pressure upon a liquid substratum, each of which has a characteristic impress upon the scenery. The influence of landslides in degradation is probably greater than has been generally believed, and locally it may predominate over all other processes, as instanced by the middle Hudson Valley where it is almost continuously active.

**GEOLOGICAL CLIMATE.** The climatic conditions during the geological past may be inferred, according to C. Schuchert, from the nature and color of sediments and their fossil content. Life forms, it is argued, have always been responsive to climatic influences, just as they are now. There is evidence of widespread glacial climates during at least four periods; two of them occur

during Pre-Cambrian time and two in the subsequent interval. The slate conglomerates of Ontario, Canada, are glacial formations of Lower Huronian age. In later Pre-Cambrian glacial conditions prevailed in two opposite parts of the globe, as shown by the tillites of northern Norway and southern Australia. The Peruvian period was accompanied by extensive glaciation in the equatorial regions and south temperate zone and left its traces in the beds of boulder-clay in South Africa, Brazil, India, and elsewhere. The last of the major glaciations was in the Pleistocene. Less well-marked cold periods seem to have occurred at other times, one at least in the Pre-Cambrian at a different age than either of those mentioned, another in the Lower Devonian, and a third in early Eocene. The cause of climatic conditions is to be sought primarily in periodic changes of the land surface; other influences are the variable supply of heat stored in the oceans and the radiation of heat by the atmosphere which varies with the composition, particularly with the proportion of carbon dioxide present.

**OCEANIC DEPOSITS.** Discoveries of deep-sea beds that have been upraised into land interest the geologist who finds in them evidence of profound changes in the relation of continent and ocean. They are directly related to the theory of crustal instability which has led to the uplift and later disappearance of land-bridges which are postulated by paleontologists on the basis of faunal migrations and which are exemplified, for instance, by Gondwanaland that once united India, Madagascar, and South Africa. An authentic occurrence of deep-sea deposits in Central Borneo was brought to notice a few years since, and has been recently described by Molengraaf. The strata consist of hard semi-transparent quartz rock which is made up almost wholly of radiolaria skeletons, and of reddish argillaceous chert with few radiolaria. The chert corresponds to the familiar red-clay of the deep-sea and the quartz to a hardened ooze. They are thought to be of Jurassic age and bear evidence of a change in the conformation of the land of much greater area than that represented by their occurrence.

**ISOSTASY.** W. H. Hobbs contributed a critical analysis of the theory of isostatic compensation as propounded by Hayford whose work was reviewed in an earlier volume of the YEAR BOOK. The anomalies of gravity which lie at the basis of the theory may be explained, in some examples at least, by abnormalities of magnetic forces or be connected with areas of seismic intensity; such is stated by Hobbs to be true for gravity determinations in Hungary where very complete and accurate data are available. In the United States it is noteworthy that the stations used by Hayford in his determinations showing the highest variations from the normal lie mainly in the intense seismic area of the Pacific Coast, while a second group of lesser intensity is found in the Atlantic coastal plain. From the facts of this distribution it seems proper to conclude that in restricted areas where crustal disturbance is in progress, as manifested by earthquakes, no complete isostatic compensation is possible. Such regions show a rigidity sufficient to support their excessive loads for long periods, and whatever adjustment takes place lags behind the effects of surface erosion and transportation. This does not necessarily imply that there is not

a tendency toward isostatic adjustment over large areas like that included in the main part of the United States, but there are sections where its influence seems annulled by other forces.

**PETROLOGY.** The crystallization of igneous magmas affords an interesting field of experimental study which has been taken up by the Carnegie Geophysical Laboratory with marked success. In one of the later contributions from this source, N. L. Bowen describes the mixtures of the series albite-anorthite-diopside which corresponds quite closely to certain simple types of igneous rocks, such as diorite and gabbro. He states that the composition of the feldspar varies not only with the original composition of the liquid but with the rate of cooling. Zoning, a feature frequently observed in the feldspar of rocks, tends to occur where the process of cooling is not sufficiently slow for the continual attainment of equilibrium. In the system plagioclase-diopside no eutectic point exists, and it is not likely that the natural rocks made up of these ingredients really represent a eutectic mixture. This conclusion has a direct bearing upon the theory of differentiation of magmas by crystallization.

Johnston and Williamson describe the operation of inorganic agencies in the deposition of calcium carbonate, for which they claim a more prominent place than has been accorded to them. The importance of this method of limestone deposition depends in the first place on the degree of saturation of the water, since the more nearly saturated the solution the greater is the chance of a permanent deposit. Temperature, salinity, and particularly concentration of carbon dioxide are the determining factors in the solubility of calcium carbonate.

**ORE DEPOSITS.** The principle of the secondary enrichment of sulphide ore bodies, one of the more important contributions by American students to this branch of geology, continues to occupy a prominent place in discussions with the realization that there is yet much to learn about the precise methods of its operation and its application in particular instances. The chemical reactions involved are particularly in need of further explanation. As exemplified by copper ores the general features of the process consist of oxidation near the surface under weathering influences, whereby copper sulphate is formed together with iron sulphate and sulphuric acid; these substances, being soluble, are carried downward by meteoric waters to the region of unaltered sulphides where a reaction takes place, leading to the deposition of a copper mineral higher in copper content than the original sulphide. By this method bodies of high-grade ore are not infrequently formed in depth, whereas the ore in the upper part of the vein may be more or less leached of its copper. To ascertain the chemical reactions that take place Zies, Allen, and Merwin have experimented with various natural sulphides like chalcocite, covellite, bornite, chalcopyrite, pyrite, pyrrhotite, sphalerite, and galena which were selected with regard to purity and subjected to treatment with copper sulphate. In all instances where the minerals came in contact with the solution an enrichment product resulted, either some one of the higher sulphides or metallic copper and cuprite. A certain amount of sulphate of the metal contained in the original sulphide also was produced, and some sulphuric acid as well. The

secondary product was crystalline and firmly adherent to the altered sulphide, just as happens in nature; its precise character depended upon the particular mineral employed. It was found that pyrite and chalcopyrite alter to covellite and chalcocite, bornite and covellite to chalcocite, and sphalerite and galena first to covellite and subsequently to chalcocite. From this it appears that the order of stability of the secondary minerals is chalcopyrite, covellite, chalcocite; each species changing to the succeeding one under the further action of copper sulphate. The investigation is still in progress and promises to yield further results of great value in the practical study of ore deposits.

A description of the Wabana iron ores of Newfoundland, by A. O. Hayes, brings to light some novel features in regard to the composition and origin of the ores, which for a time were regarded as the equivalents of the Clinton hematite deposits of this country. It is shown, however, that the Wabana beds are of lower Ordovician age, or considerably older than the Clinton strata. The ores are composed of small spherules or oölites of hematite and chamosite, the two minerals often occurring in alternating layers with a central nucleus of quartz or some other foreign matter. They are the products of marine deposition at the same time as the enclosing strata. It is thought that the iron existed in solution in the sea water and was precipitated by the action of ammonia formed by the decomposition of organic matter, to be later oxidized into hematite through the oxygen given off by algae in their life process. The tubes of these low organisms are found in such relation to the spherules as to indicate their activity in the change of the iron from ferrous to ferric state before consolidation of the sediments occurred. The oölites or spherules are themselves the result of inorganic processes in which surface tension was a controlling factor.

**OCCURRENCE OF PETROLEUM.** A laboratory demonstration of the influence of capillarity on the accumulation of petroleum is described by A. W. McCoy. Without going into the details, it is brought out that the segregation of oil and water in the capillary openings of rocks does not follow hydrostatic principles, but the water by reason of its superior capillary force drives the oil into the larger openings without reference to the structure or elevation of the strata. The difference in the capillary pressures of the two liquids for openings, measuring one-hundredth of a micron in diameter, is approximately 200 atmospheres or 400,000 pounds to the square foot, which of itself may suffice to cause up-arching or doming of the strata. At any rate the pressure would force the oil into the anticline, if it were already in existence, as the larger openings would be found there.

**GEOPHYSICAL LABORATORY.** See **CARNegie INSTITUTION OF WASHINGTON.**

**GEORGE, DAVID LLOYD.** See **LLOYD GEORGE, DAVID.**

**GEORGE, HENRY, JR.** An American political economist, journalist, and Congressman, son of Henry George, the famous single-tax advocate, died in Washington, D. C., Nov. 14, 1916. He was born in Sacramento, Cal., in 1862, had a public school education, and at 16 entered a printing office. A year later he became his father's private secretary. The two continued in close relationship, and the son was

intrusted with important work in the field of his father's interests. They were abroad together in 1884, in which year Henry George, Jr., joined the staff of *London Truth*. Afterward, for a time, he was an editor of the *North American Review*, and from 1887 to 1891 managing editor of *The Standard*, a single-tax paper founded by the elder George. For short periods he served as correspondent in Washington and in England for a syndicate of Western papers, and as editor of the *Florida Citizen* of Jacksonville. In 1897 the Jeffersonian party chose Mr. George as its candidate for mayor of New York, to replace his father, who died during the campaign. He failed of election. In 1909 he went round the world for *Collier's Weekly*. In 1911 he was elected to Congress from New York and in 1913 was reelected. He wrote: a biography of his father; *The Menace of Privilege*; and *The Romance of Henry Bainbridge*.

**GEORGE, W. L.** See **LITERATURE, ENGLISH AND AMERICAN, Fiction, American**; also **FEMINISM.**

**GEORGETOWN UNIVERSITY.** A Roman Catholic educational institution for men at Washington, D. C. It was founded in 1789. In the autumn of 1916 the students numbered 1390 and the instructors 196. During the year a new course in banking and finance was established. The library contains about 155,000 volumes. President, Very Rev. A. J. Donlon, S. J.

**GEORGE WASHINGTON UNIVERSITY.** A non-sectarian institution for the education of men and women at Washington, D. C. It was founded (as Columbian University) in 1821. In 1916, 1973 students were registered and the faculty numbered 234. Endowments amounting to \$4825 and other gifts totaling \$9865 were received. In productive funds the institution had \$104,670 and its income for the last year was \$4461. The library contains 50,000 volumes. President, Charles H. Stockton.

**GEORGIA. POPULATION.** The estimated population of the State on Dec. 3, 1916, was 2,875,953. The population in 1910 was 2,609,121.

**AGRICULTURE.** The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1915-16 were as follows:

	Acreage	Prod. Bu.	Value
Corn . . . . . 1916	4,000,000	62,000,000	\$62,000,000
1915	4,330,000	64,950,000	50,661,000
Wheat . . . . . 1916	334,000	3,808,000	7,083,000
1915	325,000	3,575,000	4,612,000
Oats . . . . . 1916	860,000	16,770,000	13,248,000
1915	905,000	17,648,000	11,648,000
Rice . . . . . 1916	800	16,000	14,000
1915	900	26,000	23,000
Potatoes . . . 1916	15,000	900,000	1,575,000
1915	16,000	1,040,000	1,030,000
Hay . . . . . 1916	800,000	a 275,000	6,075,000
1915	300,000	345,000	5,210,000
Tobacco . . . 1916	1,300	b 1,534,000	414,000
1915	1,700	1,496,000	344,000
Cotton . . . . 1916	5,344,000	c 1,845,000	175,463,000
1915	4,825,000	1,909,000	104,013,000
Rye . . . . . 1916	13,000	124,000	198,000
1915	13,000	120,000	168,000

a Tons. b Pounds. c Bales.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed as far as the figures relating to the individual States are concerned, in December, 1916, disclosed the fol-

lowing comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments . .	4,792	4,639
Average number of wage earners . . . . .	104,588	104,461
Capital invested . . . . .	\$202,778,000	\$258,326,000
Wages . . . . .	34,805,000	38,128,000
The value of materials used . . . . .	116,970,000	160,089,000
The value of products . . . . .	202,868,000	258,271,000

**MINERAL PRODUCTION.** The State is not important as a producer of minerals. Coal is the only mineral produced in any quantity, and this amounts to about 250,000 tons per year.

**TRANSPORTATION.** The total railway mileage in the State on June 30, 1915, was 7295. This was increased during 1916 by the construction of a small amount of mileage. The Savannah and Atlantic Railroad built about 35 miles of new track. Ocmulgee Valley Railroad built about 21 miles, and the Washington and Lincolnton about 13 miles. The railways having the longest mileage are the Central of Georgia, 1330; the Atlanta, Birmingham, and Atlantic, 486; the Southern Railway Company, 913; and the Sea Board Air Line, 744.

**EDUCATION.** The total school population of the State in 1915, the latest date for which statistics are available, was 795,484. The total enrollment was 625,854, and the average daily attendance was 422,728. The total value of school property was \$14,691,213. The total number of teachers was 14,382, with salaries ranging from \$60.25 for white male teachers to \$25.63 for female colored teachers. The total amount raised for educational purposes of all kinds in 1915 was \$8,313,791.

**FINANCE.** The year 1915 is the latest for which statistics are available. On Jan. 1, 1915, there was in the treasury a balance of \$787,455. The receipts during the year were \$10,158,134, and the disbursements \$10,102,791, leaving a balance in the treasury on Jan. 1, 1915, of \$842,799. The bonded indebtedness of the State was reduced \$100,000 on Jan. 1, 1916, making the total bonded indebtedness \$6028. In addition to this the State is obligated for the land script fund, amounting to \$90,202.

**POLITICS AND GOVERNMENT.** The political activity in 1916 centred around the election for Governor. There was no election for United States Senator. At the State-wide primaries held on September 12th, Hugh M. Dorsey was nominated for Governor, defeating Gov. Nat E. Harris, and several other candidates. Mr. Dorsey was the prosecutor of Leo M. Frank, who was convicted of murder in 1915, and was lynched by a mob. His nomination was strongly opposed, but was won by a plea to elect a Governor who would enforce the law. In the presidential election Wilson received 125,831 votes, Hughes 11,225, and the Progressive candidate 19,085. In 1912 Wilson received 93,076, Taft 5191, and Roosevelt 21,980. On January 12th, three Federal judges upheld in a decision the Prohibition laws of the State, overruling a contention that the law was unconstitutional. On May 1st new prohibitory laws went into effect making the selling of liquor much more difficult than under the former law. Under the terms no beverage containing as much as one-half of 1 per cent of alcohol can be lawfully sold in the State. This resulted in the closing

of many saloons, locker clubs, and beer gardens. (See LIQUOR REGULATION.)

On March 22nd a fire swept over an area of 1¼ miles in Augusta, destroying 10 business blocks and 20 blocks of residences. Among the buildings burned was St. Paul's Episcopal Church, which was 125 years old, and the homes of two local newspapers. One life was lost, and there was a property loss of \$5,000,000, including \$2,000,000 worth of cotton.

**STATE OFFICERS.** Governor, Hugh M. Dorsey; Secretary of State, Philip Cook; Treasurer, William J. Speer; Comptroller, W. A. Wright; Attorney-General, Clifford Walker; Adjutant-General, J. Van Holt Naah; Superintendent of Education, M. L. Brittain; Commissioner of Agriculture, J. J. Brown—all Democrats.

**JUDICIARY.** Supreme Court: Chief Justice, William H. Fish; Presiding Justice, Beverly D. Evans; Associate Justices, M. W. Beck, Samuel C. Atkinson, H. W. Hill, and S. P. Gilbert; Clerk, Z. D. Harrison.

**STATE LEGISLATURE.** Almost wholly Democratic.

**GEORGIA, UNIVERSITY OF.** A State educational institution at Athens, Ga., founded in 1801. In the fall of 1916 the student body numbered 701 and the faculty 63. In productive funds the university has \$389,306, and in 1916 from all sources it drew an income of \$131,821. In the library are 41,000 volumes. Chancellor, David Crenshaw Barrow.

**GERMAN EAST AFRICA.** A protectorate of Germany (see GERMAN PROTECTORATES) bordering the Indian Ocean from the mouth of the Umba to lat. 10°40' S. and thus lying between the East Africa Protectorate (British) and Portuguese East Africa. It extends to Victoria Nyanza at the north, Lake Tanganyika at the west, and Lake Nyassa at the south. Capital, Dar-es-Salaam. The protectorate was established in 1885 by the Germans, who in 1890 acquired the rights of the Sultan of Zanzibar over a strip of coast territory by payment of 4,000,000 marks. The estimated area of the protectorate is 995,000 square kilometers (384,170 square miles). Estimated native population, 7,646,000; other colored, 15,000; whites (Jan. 1, 1913), 5336 (of whom 4107 German); total, about 7,666,000. Ten Protestant and three Roman Catholic missionary societies are represented in the protectorate. Number of schools before the outbreak of the great war 1944, with 114,964 pupils.

The natives practice agriculture to some extent, and grazing. In 1912 there were 3,950,250 cattle and 6,398,300 sheep and goats belonging to natives, and 43,617 cattle and 41,647 sheep and goats belonging to whites. The produce of the German plantations, which are mostly near the coast, includes coconuts, vanilla, tobacco, rubber, coffee, cotton, sisal, etc. Imports and exports in 1913 were valued at 53,358,000 and 35,550,000 marks respectively, as compared with 50,309,000 and 31,418,000 in 1912. Imports from and exports to Germany in 1912, 25,819,000 and 17,827,000 marks respectively. Principal exports in 1912 and 1913, in thousands of marks: sisal, 7359 and 10,710; rubber, 8426 and 6567; hides and skins, 4067 and 5591; raw cotton, 2110 and 2414; copra, 1563 and 2348; earthnuts, 1273 and 1918; insect wax, 829 and 1415; coffee, 1903 and 931; raw gold, 531 and 678. Railway in operation

in the spring of 1914, 792 miles; under construction, 104 miles. In the year 1913-14, local revenue was 16,506,000 marks; expenditure, 23,771,000; in addition, expenditure from loan, 37,500,000 marks. The budget for 1915-16, as well as that for 1914-15, balanced at 81,271,068 marks, the estimated revenue consisting of 20,471,068 marks local receipts, 3,300,000 marks imperial contribution, and 37,500,000 marks loan. German East Africa is the most valuable of the German protectorates.

**HISTORY.** In April there were five invading armies closing in on the last remaining German colony in Africa. The point toward which the troops were converging was the stronghold at Tabora on the Central Railway in the highlands. Lieutenant-Colonel Vandeventer's British column had already advanced to a point towards the Central Railway, driving the Germans before them. West of Victoria Nyanza, British troops took Bukoba early in July, while to the west of that point, Belgian troops had passed as far as Biaramula on June 24th and had occupied a point to the east of Lake Tanganyika. The column of Brigadier-General Northey by July 24th had advanced from Nyassaland, driving the Germans from strong positions. The circle was drawn still closer in August, British naval forces seizing, on August 1st, the port of Sadani, the important military coast station of Bagamoyo. In the south the Central Railway was cut at several points. The campaign of General Smuts had started from Nairobi as the base, whence an enveloping movement was directed toward Moshi, the terminus of the Tanga-Kilimanjaro railway. This was partly successful, but the enemy succeeded in making his escape along the railway. Moshi was captured after some severe fighting. The struggle was renewed along the line of the Tanga railway, but finally the enemy broke and fled. A peculiar feature of the campaign was the extraordinary composition of General Smuts's army, which contained not only native troops, and troops from every portion of South Africa, but Canadians and Australians as well. Practically the whole Empire was represented in that small fighting force. General Smuts's force began an advance movement on August 5th and soon reached the Majonga valley, where some stubborn resistance was encountered, but where on August 11th the Germans were put to rout. The invaders on August 15th had reached a point only 25 miles distant from the Central Railway. Meanwhile, to the west, Lieutenant-Colonel Vandeventer, after seizing several points on the Central Railway, defeated the enemy at a point to the west of Mpwapwa. The British took possession of two islands in Lake Tanganyika and on July 28th a German gun-boat was sunk by a Belgian gun-boat. Early in August Ujiji, the terminus of the Central Railway, was occupied. Brigadier-General Northey's column, after defeating the Germans on July 24th, made a considerable advance. A combined military and naval attack took Dar-es-Salaam on September 3rd, and there were other gains in that region. A little later landing parties occupied two ports about 170 miles to the south and still later all the remaining ports of the colony fell into their hands. Tabora was taken by the Belgians on September 11th. Portuguese troops entered the colony from Portuguese East Africa and advanced to Taketo, the Germans retreat-

ing before them. On December 11th, a further British advance of 60 miles on a front of 200 miles was reported. It started from Kissaki and New Iringa and reached the coast. See **WAR OF THE NATIONS.**

**GERMAN EVANGELICAL SYNOD OF NORTH AMERICA.** Communications of this denomination are to be found in practically all the States of the Union, though they are most numerous in the Central and North Central States. There were in 1916 1089 ministers, 1389 churches, and 274,787 communicants. The value of the church property is about \$1,500,000, and over \$1,000,000 a year is contributed for the maintenance of churches. Missions are carried on in India, where there are over 4000 adherents. The Eden Publishing House, the official publication agency of the denomination, is at St. Louis, Mo., and there is a branch at Chicago. There are literary committees in German and English. There are five periodicals published at St. Louis, besides Bible lessons and Sunday school helps. The Eden Theological Seminary is maintained at St. Louis, a college at Elmhurst, Ill., and Fort Collins Seminary. There are also charitable institutions for superannuated ministers, for the widows and orphans of deceased ministers, and for orphans. In 1916 a commission was appointed to discuss ways and means of bringing about closer relations with other churches at home and abroad. A fraternal message embodying the sentiments of the resolutions, favoring closer relations, was ordered to be transmitted to all Lutheran bodies, the German and Dutch Reformed Churches, and to the Moravian Church.

**GERMANIC PHILOLOGY.** See **PHILOLOGY, MODERN.**

**GERMAN LITERATURE.** When the Old World, after its acute and disastrous attack of war madness, returns to its senses and resumes the normal course of its foreign relations, it will be found that our records of its literary achievements during these turbulent times are sadly incomplete. For when even literary magazines are prevented from reaching this country and the book importation from Germany has practically ceased, the information which students of contemporary German letters can gain from the few available sources must necessarily be fragmentary. But even the meagre data that could be collected convey the impression that the publishing business, at least for the first half of the year 1916, was very little affected by the war. It cannot be denied, however, that the general standard of literary production is lower than it was before the war. The patriotic enthusiasm has so far not inspired a single work of such power that it would convincingly carry its message across the political boundary-lines. The dominant note is one of insistent self-righteousness, of challenge and defiance; the signs of a spiritual renaissance which one expects in the wake of such an ordeal as that through which the belligerent nations are passing, have not yet manifested themselves in the world of German letters. The writers who refrain from joining in the somewhat melodramatic effusions of an exaggerated nationalism continue to give us their pseudo-scientific conceptions of life in the naturalistic manner which other nations have discarded. There is no doubt, too, that the masters of German

classicism are being neglected. The number of books dealing with Goethe from a historical, critical, biographical, psychological, and even medical standpoint is visibly decreasing. One is tempted to infer that the man whose universal—not to say, cosmopolitan—mind conceived a world-literature, cannot well be covered by the Pan-German formula. Schiller fares no better. In his case one might infer that the flamboyant freedom-spirit of *Die Räuber*, *Don Carlos*, and *Wilhelm Tell* is—to say the least—uncongenial to the imperialistic Germany of to-day. Actuality is the paramount issue in German letters. Creative work of a purely imaginative character seems for the present almost paralyzed. History interests only as far as it touches upon national problems. Biography is uninteresting, where the individual life counts for so little. Hence the startling decrease in the number of historical, biographical, and other works which at other times figured largely on the book-market. The official and unofficial censorship, too, may affect those forms of literature which, for their effect, depend upon the unrestricted freedom of self-expression. Not a few German writers have found themselves hampered by the numerous "Verbote" of the authorities, and have been obliged to take up their residence in neutral countries and when their works, under the imprint of foreign publishers, found their way into the fatherland and contained passages trespassing against the spirit sanctioned by those authorities, they were promptly confiscated. It is safe to infer that the German writers residing in Switzerland and, like Hermann Hesse, writing for Swiss papers, represent the voice of that Germany which the authorities at home would like to silence. That even Maximilian Harden, who, at the outset of the war, was as loyally imperialistic as any champion of Pan-Germanism, was obliged to take up his abode in the neutral little republic, is significant. The sensations of the book-market have all come from Switzerland. Close upon the anonymously published *J'accuse*, which was the sensation of 1915, followed Hermann Fernau's *Gerade weil ich ein Deutscher bin* and after that Eduard Stilgebauer's novel *Inferno*, which shared with its predecessors the honor of being confiscated and forbidden in Germany.

FICTION. It seems natural that Helene Böhlau, the whole-souled woman whose stories of old Weimar have placed her in the first rank of German novelists, should at this time turn back to the period of Goethe and give us a story with the quaint title *Der gewürzige Hund*; for it is inconceivable that a woman of her universal grasp of life would be contented to restrict herself to the keynote of nationalism. Nor is it likely that Gabriele Reuter, the admirer of English and American thinkers, of Emerson, Whitman, Edith Wharton, and others, who a few years before the war took up her residence in Switzerland, is in her new novel *Das neue Land* voicing the current sentiment of the Berlin populace. Carry Brachvogel has chosen as the scene of her latest story, *Die grosse Gauklerin*, Venice, the beautiful sorceress among the cities of Europe. Dora Duncker, whose fame rests upon her truthful pictures of modern Berlin life, and who died during the year, wrote *Die graue Gasse*. Meta Schoepp's *Blockade* and Helene Mühlau's *Der Kriegs-*

*freiwillige* suggest by their titles that their authors were inspired by the actualities of the war. Georg Hirschfeld's *Der japanische Garten* does not in its title convey such suggestion, yet the time of the story is given as 1914. Georg Herrmann, whose *Jettchen Gebert* and *Henriette Jacoby* presented such delightful pictures of Berlin life in the first half of the nineteenth century, has written a novel on similar lines: *Heinrich Schön, Jr.* Kurt Münzer, also, gives us a novel of Berlin in his *Menschen von Gestern*. Hermann Hesse struck such a high mark with his first story, *Peter Camenzind*, that every book which has since come from his pen suffers by comparison. *Am Weg* is a thoughtful narrative of an intimate charm, but lacks the epic breadth of the earlier work, which seems destined to become a classic of the adolescent of the eighties. Hans Land's *Artur Imhoff* is another of those intimate character studies in which German fiction abounds, but the author does not reach in it the excellence of his previous work. The romance of Franz Schubert's life appeals strongly to the German temperament, and although barely four years have passed since the publication of a Schubert story by Rudolf Hans Bartsch, a novel by J. A. Lux, *Franz Schubert's Lebenslied*, deals with the friendships of the composer. Compared with the somewhat flippant and commonplace "journalism" of his recent novels, Kurt Aram's *Der elfenbeinerne Turm* suggests, at least in its title, a more serious note. Richard Voss rarely allows a year to pass by without a new story, though the quality of his work has long reached a uniform mediocrity which makes one wish he were less prolific; his new book, *Das Modell*, is no exception. Hanns von Zobeltitz, a writer whose popularity is greater than his attainments, is the author of a novel called *Die Fürstin Witwe*. Fedor von Zobeltitz has a reputation as a bibliophile which makes it very difficult to associate him with the authorship of some threescore volumes of light fiction, of which his humorous war-story, *Das vor schnell vermählte Ehepaar*, is the latest. Freiherr von Schlicht, the author of many humorous and satirical stories of army life in his country, has published a historical-patriotic novel under the title *Weit vom Schuss*. Among the works distinguished by an originality which sets them apart from the German fiction of the present is the weirdly fanciful Poe-esque story of the Ghetto of old Prague. *Der Golem*, by that master of quaint humor and pungent satire, Gustav Meyrink, whose contributions to *Simplicissimus* have been one of the most interesting features of that magazine. Another story of unique character is the semi-historical novel of the time of Kepler, *Tycho Brahe's Weg zu Gott*, by Max Brod. The novel which undoubtedly would have created the greatest sensation in Germany, had it not been promptly confiscated and "verboten," is *Inferno* by Eduard Stilgebauer. A realistic story of the present war, dauntlessly exposing some of the evils of the military system and sins of official Germany, Stilgebauer has voiced in this book the sentiments of those who have to grit their teeth in silence, and has in a measure redeemed his reputation which was somewhat impaired by the dubious advertising methods to which he—or his publisher—had resorted at the time of his début in German letters.

The number of books of short stories is, as usual, very great. It seems curious that many of them do not seem to take account of the grim reality of the present. Somehow books that are deliberately announced as "jolly" seem out of place at this time. Marie Stoma, who, some 20 years ago, was known in Young Germany as the author of several books of delightful lyric verse, has chosen a peculiar moment to send out her volume of stories entitled *Die Heidelerche und andere heitere Geschichten*. A. Achleitner figures on the title-page of a volume of hunters' stories: *Im grünen Roocke*. Karl Hans Strobl calls his book *Der Krieg im Alpenrot*. Helene Christaller's *Von Liebe* and Paul Ilg's *Was mein einst war* are good examples of the story of sentiment which is as popular in Germany as elsewhere. Bernd Isemann is a writer of no little originality, of which his latest book, *Maria im Tempel*, is a fair specimen. Heinrich Lilienfein seems to have interrupted his dramatic production by an excursion into fiction; *Im stillen Garten* is a book of pensive moods rather than dramatic moments. Gertrud Franke-Schievelbein, who some years ago attracted notice by a very well-told novel, has published a collection of stories under the suggestive title *Stilles Heldentum*. Anselma Heine is a clever story-teller whose *Fern von Paris* is bound to hold the attention of her readers. Carl Sternheim, one of the most uncompromising "moderns" of the present generation, has collected his previously published *Busekow*, *Napoleon*, and *Schuhlin* in a volume called simply, but proudly, *Die drei Erzählunaen*. A Swiss writer, Jakob Bühler, has published a volume of stories of war and peace under the title *Die Steinhauer Marie*. A posthumous volume by J. V. Widmann is entitled *Jugendeseleien*, and one by Marie Ebner-Eschenbach *Stille Welt*.

**DRAMA.** The dramatic production of the year has been singularly poor in works of genuine power. Nor has it been as much influenced by the war as has the fiction of the year. After Hermann Sudermann had taken cognizance of the prevailing depression in *Die entgötterte Welt*, which in a sub-title he called scenes of a diseased time, he promptly turned to a lighter and more popular theme and gave us the five-act tragi-comedy *Die gutgeschnittene Eoke*. But neither of the two works impressed the critics, who have been rather severe with the author for some years, as spontaneous genuine creations likely to become part of the repertory of the German stage. Ludwig Fulda, too, who among the writers of the older generation ranks next to Sudermann in popularity, did not add to his reputation by his play of modern life, *Der Lebensschüler*, which, besides other reminiscent features, harked directly back to the "motif" of *Sodoms Ende*. An Austrian dramatist who has come to the fore within the last decade and in contrast to his typically Viennese and rather decadent colleagues, Schnitzler and Hofmannsthal, represents the sturdy health of the Austrian mountain-folk, is Karl Schönherr. Whether he touches the theme of religious tolerance and prosecution, as in *Glaube und Heimat*, or presents the problem of the peasant on his soil in *Erde*, or satirizes the follies of woman, as in *Weibsteufel*, he is always sure of striking a note of wide appeal. The very title of his latest work, *Volk in Not*, suggests that

he is cleverly utilizing the curt phraseology to impress his readers and his audience and create a receptive mood. His work may fail to rise to any height of originality, but it is always simple and forceful in style, and shows his ability to play on the emotions of his audience. The part which Frank Wedekind plays in German drama is as much that of an *enfant terrible* as that of Bernard Shaw on the English stage. It has pleased Wedekind in his earlier unblushingly "naturalistic" works to call himself a "moralist," a label which seemed out of place for the man of the Mephistophelian smile and the puzzling paradox. He has seen fit under the pressure of the war to turn to a new field and has produced a historical drama in five acts: *Bismarck*. Wedekind's political creed being Pan-Germanism, it is, after all, quite in harmony with his complex character that he should pay loyal tribute to the man who is responsible for the Germany of to-day. Aside from Houston Stewart Chamberlain, who has valiantly proclaimed his "Teutonium" and taken an active part in the war literature, it seems possible in Bayreuth to keep aloof from the harassing conditions due to the war. For Siegfried Wagner has sent out a new fairy play, with the almost childlike title *An Allem ist's Hüthen schuld*. Undoubtedly he will, before long, make it into an opera. Walter Harlan, too, the author of many quaintly serious and humorous stories, strikes a blithesome note in his latest work, *In Kanaan*, which, in a sub-title, he calls "a merry mystery-play." Raoul Auernheimer, the author of many clever society plays, has written a comedy of the Congress of Vienna which he calls *Die verbündeten Mächte*. Hans Kyser, a writer of no little originality, has chosen for his theme the absorbingly interesting tragic life of Charlotte Stieglitz, one of the women who had given Berlin its first literary salons in the thirties. Georg Herrmann's *Henriette Jacoby*, dramatized from his novel of that name, belongs to the same period; but it is doubtful whether the play can equal the story, the charm of which lay in the intimate psychology and in an atmosphere which can rarely be carried beyond the footlights. Emil Strauss has published a new version of his tragedy, *Don Pedro*. Franz Blei, the valiant champion of Wedekind, Sternheim, and others, and himself a fair example of the decadence of Young Germany, is the author of a four-act comedy, *Logik des Herzens*. Oscar Jerschke, who for some years collaborated with Arno Holz, strikes a note sure of finding resonant echo at this time in his five-act drama of 1813, which he calls *Mein deutsches Vaterland*. A comparatively new name is that of Ludwig Jakob Ritter, who, in his *David*, with the traditional Bathsheba episode, announces the "dawn of man" and makes an attempt to suggest comparisons with the present. In spite of this new declaration of male supremacy, a number of women have successfully rivaled men in the dramatic production of the year. Lina Feuchtwanger is the author of a three-act drama, *Julia Farnese*, which presents an interesting variation of the Salome motif. Lu Vollbeh, who had so far been chiefly known as a novelist of great talent, has written a three-act play, called *Kathrin*. Else Feldmann attempts to rival Schalom Asch, the master of modern German Ghetto stories and

plays, in a four-act play of the Ghetto with the significant title, *Der Schrei den Niemand hört*.

POETRY. The lyric production of the year is proof of the habitual tendency of the German people to rush into verse at the slightest emotional suggestion, and surely this greatest of all wars is a worthier topic than they have had in a long time. Yet it does make a painful impression to see so sane and well-balanced a mind as that of Cæsar Fleischlen, who had occupied a rather unique position in the world of German poetry, succumb to the patriotic infection and join the mass chorus of sword-rattling, swash-buckling bards. When the war-madness is over, his book of verse with the rousing title *Kopf oben auf, Hand am Knauf, mein deutsches Volk . . . Sonn' auf* is not likely to have added to his prestige. Karl Ernst Knodt's choice of title, *Ich hott' einen Kameraden*, seems much more appropriate at a time when the war brings sorrow into so many a home. Anton Wildgans, the young Austrian, who only a few years ago made his début with a distinctly original volume of verse, calls his book of war poems simply *Oesterreichische Gedichte 1914-15*. The Swiss poet, August Bernoulli, suggests a return to the lore of his country in *Sankt Jakob's Helden-schlacht*. Anna, Baroness von Krane, who has for some time been identified with Catholic publications, is the author of a book of verse entitled *Der Friedensfürst*. Love lyrics, which are at other times far more numerous than others, were less in evidence on this year's book-market. Heinrich Hans Ehrler, who made his début a few years ago with a charming volume of idyllic prose, has written a book of verse, called *Die Liebe leidet keinen Tod*. Ilse Francke's *Das heilige Geheimnis* is a volume of poems dealing with the mystery of marriage. Alfons Petzold, the workingman-poet of Vienna, dedicates to the memory of his wife: *Johanna, ein Buch der Verklärung*. Richard Zoozmann, a prolific compiler and editor, has published an anthology of humorous poems under the title *Unartige Musenkinder*. A most interesting annual of verse and prose, *Vom jüngsten Tag*, presents the work of the generation that had begun to appear in print shortly before the war and claims for it after the war—"elbowroom to struggle for its ideas which are necessarily different from those of the older." The volume contains verse by Ernest Stadler and Georg Trakl, who were both claimed by the war, Georg Heym, Walter Hasenclever, Albert Ehrenstein, Johann Becher, Paul Boldt, Berthold Viertel, Alfred Wolfenstein, Max Brod, Rudolf Leonhard, Max Pulver, Paul Kraft, Ernst Blass, Else Lasker-Schüller, Rene Schickele, Paul Zech, and Franz Werfel. There are prose contributions by others.

LITERARY CRITICISM, ETC. That even books of a purely literary or critical character take their cue from current events and the nationalistic trend is evident from not a few of the recent publications. Dr. Ernst Elster, of the University of Marburg and one of the editors of Meyer's *Konversationslexikon*, is the author of *Deutschtum und Dichtung*. Artur Möller van den Bruck, who, a few years ago in a remarkable book of essays, spoke in extravagant terms of Russia and America as the youngest countries, those to whom the future belongs, has also been affected by the spirit of the present and discourses on *Der preussische Stil*. That

Heinrich Luden's *Goethe über Deutschland's Zukunft* is an attempt to divine what would have been the attitude of Goethe toward the Germany of to-day, seems a foregone conclusion. Rudolf Eucken contributes to this literature of the time *Die Träger des deutschen Idealismus*. Ludwig Fulda, too, the translator of Molière, Rostand, and others, has seized upon a timely topic in *Deutsche Kultur und Ausländerei*. The place and meaning of Heidelberg in German letters has been treated in Philipp Wittkopp's *Heidelberg und die deutsche Dichtung*. Dr. Hermann Nohl's *Typische Kunststile in Dichtung und Musik* is a readable essay on these closely related arts. A valuable contribution to the literature and history of the theatre is *Vor der Rampe*, by Dr. Heinrich Stümcke, for many years the editor of *Bühne und Welt*. A book of similar import is Julius Bab's *Die Frau als Schauspielerin*. Franz Blei, ever a protagonist of the ultra-modern, has sent out a volume called *Wedekind, Sternheim und das Theatre*. There have been critical appreciations of Grillparzer, Geibel, and others. Adolf Bartels has compiled 12 lists of the best German fiction under the title *Die besten deutschen Romane*.

BIOGRAPHY, MEMOIRS, ETC. Biography is very scantily represented among the books of the year. A new edition of Dr. Karl Federn's *Dante und seine Zeit* is the most important work. Important for the history of the theatre is the volume of reminiscences by Ernst Possart, *Erstrebtes und Erlebtes*. A volume of letters of Theodor Storm to his wife was welcomed by the many admirers of the writer whose *Immensee* still finds favor with students of German. Alexander von Gleichen-Russwurm, whose books on the history of social manners and customs have come to be looked for with eagerness, has written an interesting volume of grotesque satires under the title *Der Narrenturm*. Wilhelm Bölsche is alarmingly prolific, yet his scientific chats on nature and kindred subjects do not seem to lose any of their charm. This year he has published *Von Wundern und Tieren* and *Die deutsche Landschaft in Vergangenheit und Gegenwart*. Georg Herrmann, the novelist of Berlin life, has written a book of reflections and meditations entitled *Vom gesicherten und ungesicherten Leben*. Heinrich Lhotzky, whose books on ethical topics have a unique place in German letters, has sent out a book called *Vom heiligen Lachen*, which is not only attractive reading but full of suggestion. Emil Lucka, a student of psychology, whose writings are being translated into English, published *Grenzen der Seele*. Helene Lange, one of the champions of the woman's movement in her country, has contributed to the literature of feminism, *Die Frauenbewegung*.

CURRENT EVENTS. The number of books more or less directly inspired and influenced by the war is so large that only the most important names can be selected from the long list. The venerable Ernst Haeckel is struggling with the problem of the cataclysm that has engulfed the Old World in a book entitled *Weltkriegsgedanken über Leben und Tod, Religion und Entwicklungslehre*. Dr. Karl Lamprecht has outlined a picture of the Germany to be in *Deutschlands Zukunft*. Ferdinand Avenarius, the dignified editor of *Der Kunstwart*, has been shocked by the part which the

war cartoon is playing in shaping public opinion and has written *Das Bild als Verleumder*. Theodor von Sosnowsky presents a political study entitled *Der Dreißigj. Rudolph*. Hans Bartsch offers a commentary on the war in *Das deutsche Volk in schwerer Zeit*. Ernst Borkowaky writes under the well-worn title *Unser heiliger Krieg*. Julius Bab offers his reflections on the events of the present in a volume called *Am Rande der Zeit 1914-15*. True to the tendency of modern Germany to drag the sex problem into the discussion of almost any subject, Dr. Helene Stöcker has written *Geschlechtspsychologie und Krieg*. Books of current war history from the national standpoint are innumerable. Eberhard Bucher is publishing a series of *Kriegsdokumente*. Adolf Köster has written *Die stille Schlacht. Kriegsberichte aus dem Hauptquartier*. Wilhelm Schmidtbonn's *Menschen und Städte im Krieg*, Karl Franz Ginzkey's *Die Front in Tirol*, Ferdinand Gregori's *Sachsenspiegel*—a book of impressions of the second year at the west front—and many others are more or less journalistic in origin, but will take their place in the library of "documents" of the war. Stanislas Przybyzowski, the erratic and bibulous genius, who for the past 25 years has been alternately residing in Germany and in Poland and writing in the two languages, seems under the pressure of the present to have asserted his loyalty to Germany by taking up the all too popular cue of the "holy war" in his book *Polen und der heilige Krieg*.

**NEW EDITIONS.** Among the new editions put on the market have been some curiously interesting revivals. The most important from the political standpoint is a German edition of selections from the works of Frederick the Great which were originally written in French: *Friedrichs des Grossen Ausgewählte Werke*. That Heinrich Heine's choice satire, *Deutschland ein Wintermärchen*, should appear in a new edition at this moment, seems almost like a joke which escaped the notice of the censor. From a literary standpoint the new interest in E. T. A. Hoffmann, the erratic but undoubtedly most original of German romanticists, is to be welcomed. A volume of his diaries and literary fragments has appeared and a new edition of *Lebensansichten des Kater Murr*, a work of which it can safely be said that it has no parallel in the world's literature. There has been put on the market a critical edition of Martin Luther's complete works, Hermann Grimm's *Aufsätze zur Literatur*, and Gottfried Keller's *Die drei gerechten Kammerherren* have appeared in new editions. Friedrich Hebbel's dramatic works have been published in four volumes. A volume of Karl Stieler's poems in Bavarian dialect have appeared under the title *Verse*. The complete works of Theodor Fontane, Theodor Storm, and Heinrich Seidel, and the complete poetical works of J. V. von Scheffel and Ernst von Wildenbruch have been put on the market.

**TRANSLATIONS.** The number of translations into German seems to have decreased. Still the list contains such works as Frederik van Eeden's *Paul's Awakening*, Selma Lagerlöf's *Trolls and Men*, Eleanor Porter's *Marian*, Gabriele Zapolska's *Summer Love*, and others. There have also appeared some translations of the classics, among them Catullus and Sopho-

cles. Among works translated from the German into other languages there have been few that did not directly refer to the war. But one of the most interesting facts to be noted is the translation into French of Carl Spitteler's *Olympischer Frühling* and *Leutnant Konrad*, works of a Swiss poet who had been a great favorite in Germany, until he openly declared himself in favor of the Allies.

**MISCELLANEOUS.** Among the literary events of the year must be noted the newly resumed activity of the censor. It manifested itself in Breslau by prohibiting the performance of Arthur Schnitzler's *Professor Bernhardt*, in Essen of Max Halbe's *Jugend*, in Danzig of Carl Schönherr's *Weibeteufel*, in Mayence of Hermann Sudermann's *Ehre* and Karl Leyse's *Danton*, and in Berlin of Carl Sternheim's *Der Snob* and four other plays, and of Strindberg's *Fräulein Julie*. On the other hand, Carl Sternheim has been awarded the Fontane prize for his three stories, *Busekow*, *Napoleon*, and *Schuhlin*. John Henry Mackay, a poet of Scotch birth, but a naturalized German, who played a prominent part in the literary revolution of the eighties, is the recipient of the Specht prize of 3000 marks.

**NECROLOGY.** Among the writers who have died during the year are not a few that will be sadly missed. The best known among them was undoubtedly Johannes Trojan, the octogenarian, who for some 20 years edited the comic weekly *Kladderadatsch* and had a number of books of humor and satire to his credit, but none of them as popular and as charming as his juveniles. A figure no less popular in, and identified with, the life of Vienna, has passed away in Vincenz Chiavacci, who, in spite of his 70 years, was still active and as editor of the *Wiener Bilder* and the humorous pages of the *Oestreichische Volkzeitung* will not easily find a worthy successor. Chiavacci was the author of many volumes of sketches and stories of Viennese life, some farces, the biographies of Ludwig Ganghofer and Ludwig Azengruber, and was one of the editors of the complete works of Nestroy. Lily Braun (q.v.) had become famous as a feminist as well as for her writings. Dora Duncker and Marie, Baroness von Ebner-Eschenbach (Austrian), are two other women writers of note who have died. In Count Franz Lützow Germany lost a great authority on Czech history and literature. The loss of Ernst Sieper, Germany's greatest authority on English literature and art, for some time connected with the Early English Text Society and of late lecturer at the university of Munich, is perhaps for the present irretrievable. For Sieper did not share the anglophobia of the majority of his colleagues, ridiculed the attempt to Germanize Shakespeare, and only a short time before his death protested against the chauvinism and imperialism which destroyed the work of decades, the slow building up of a literature of international understanding and cooperation. Among the poets whose loss will be felt is Gustav Falke, a writer of the generation of Liliencron. For authors just mentioned and for Berlepsch, Hansjakob, Hirth, Pochhammer, and Schlenther, see NECROLOGY. See also ELIZABETH.

**GERMAN NEW GUINEA.** A protectorate of Germany, occupied by British troops in 1914 (see GERMAN PROTECTORATES), including Kaiser-

Wilhelmsland (the northeastern part of the island of New Guinea), the Bismarck Archipelago, and the German Solomon Islands. The estimated area is 240,000 square kilometers (92,664 square miles). The capital is Rabaul, on the island of Neu-Pommern. Dependencies of the protectorate are the Caroline, Palau, Mariana (or Ladrone), and Marshall islands; their area is given as 2476 square kilometers (956 square miles). Germany declared a protectorate over Kaiser-Wilhelmsland and the Bismarck Archipelago in 1884, and acquired the Micronesian dependencies from Spain in 1899. The total native colored population of protectorate and de-

man Samoa, and Kiaochow. The total area, which is estimated at about 1,140,000 square miles, is nearly five and one-half times the area of Germany. The population of many districts is conjectural, but the total has been estimated at about 13,237,000. German New Guinea includes Kaiser-Wilhelmsland (the northeast part of the island of New Guinea), the Bismarck Archipelago, and the German Solomon Islands. The estimated area and population of the several protectorates, with their capitals, or administrative headquarters, are shown in the accompanying table; the figures for white population relate to Jan. 1, 1913.

Protectorates	Sq. km.	Sq. m.	Colored		White		Capital

\* The official German estimate is 1,000,000 less but by France in 1911.

it does not include the population of the territory ceded

dependencies is estimated at 600,000, and the number of other colored inhabitants at 2000. White inhabitants of the protectorate at the beginning of 1913 numbered 968 (German, 746), and of the dependencies, 459 (German, 259). There are five Roman Catholic and four Protestant missionary societies represented in German New Guinea. According to the latest available report, schools numbered 516, with 18,486 pupils.

Trade statistics are not available later than for 1912; imports to and exports from the protectorate and dependencies have been as follows, in thousands of marks:

	Imports		Exports	
	1911	1912	1911	1912
Protectorate .....	5,299	5,872	4,109	5,041
Dependencies .....	2,716	3,385	7,917	7,046
<b>Total .....</b>	<b>8,015</b>	<b>9,207</b>	<b>12,026</b>	<b>12,087</b>

The chief export is copra, valued at 4,501,000 marks in 1911 and 6,010,000 marks in 1912; the share of the dependencies in the copra export was 1,169,000 marks in 1911 and 1,958,000 marks in 1912. The most important export of the dependencies is phosphate, valued at 6,558,000 marks in 1911 and 4,991,000 in 1912. In 1911 and 1912 respectively, imports from Germany amounted to 3,422,000 and 3,177,000 marks; exports to Germany, 6,484,000 and 6,480,000 marks.

The budget for 1915-16, as well as the budget for 1914-15 balanced at 3,833,886 marks, the estimated receipts including an imperial contribution of 1,717,022 marks.

**GERMAN PROTECTORATES.** The colonial possessions of Germany, or protectorates (Schutzgebiete) as they are called, are German East Africa, Kamerun, Togo, German Southwest Africa, German New Guinea, Ger-

man East Africa borders the Indian Ocean somewhat south of the equator; its land frontiers march with those of British, Belgian, and Portuguese possessions. Kamerun, which lies on the opposite side of the continent, touches the eastern part of the Gulf of Guinea; it is bounded on the northwest by British and on the east and south by French territory, while its coast line is broken by the small Spanish colony of Rio Muni y Cabo San Juan. Togo extends inland from the north shore of the Gulf of Guinea between the Gold Coast (British) and Dahomey (French). German Southwest Africa is bounded by Portuguese territory on the north and British territory on the east and south; its long Atlantic coast line is broken by the small British possession of Wal-fish Bay. Kiaochow is on the east coast of the Chinese province of Shantung.

The commerce of the German protectorates is shown below, in thousands of marks:

	Imports		Exports	
	1912	1913	1912	1913

At the end of 1916, East Africa was the only German protectorate that had not been conquered by the Allies. A large part of it, however, together with the railways, had fallen to the invading forces, which included British, South African, Belgian, and Portuguese troops. The protectorate was established in 1885.

The Kamerun protectorate dates from 1884. The protectorate was invaded by British and French forces in the autumn of 1914 and was finally conquered in February, 1916. For administration the country has been divided between the British and French.

The Togo protectorate was established in 1884. It was conquered by Anglo-French forces late in August, 1914, after a three-weeks' campaign. Part of the country is under French and part under British administration.

The Southwest Africa protectorate was also established in 1884. The protectorate was invaded by South African forces soon after the outbreak of the great war and was finally conquered in July, 1915. It is administered by the Government of the Union of South Africa. German New Guinea was occupied by the British in 1914.

A German protectorate was declared over Kaiser-Wilhelmsland and the Bismarck Archipelago in 1884. These lands and the German Solomon Islands were occupied by Australian troops in September, 1914, and have since been administered by the commonwealth government. The Caroline, Marshall, Palau, and Mariana islands were acquired by Germany in 1899; they were taken by Japan in October, 1914.

The protectorate of Samoa was established in 1900. It surrendered to a New Zealand force late in August, 1914, and has since been administered by the Dominion government.

Kiaochow was declared a German protectorate in 1898. In November, 1914, Tsingtao surrendered to Japanese and British forces, and has since been administered by the Government of Japan.

Y. B. 16—10.

See GERMAN EAST AFRICA; GERMAN NEW GUINEA; GERMAN SAMOA; GERMAN SOUTHWEST AFRICA; KAMERUN; KIAOCHOW; TOGO.

**GERMAN REFORMED CHURCH.** See REFORMED CHURCH IN THE UNITED STATES.

**GERMAN SAMOA.** Samoa, or the Samoan Islands, is a group in the Pacific Ocean about 14° S., having a total area of about 1070 square miles. The islands east of 171° E. belong to the United States (chief islands are Tutuila and Manua). The islands west of 171° E. constitute a German protectorate, established in 1897; its total area is about 994 square miles, including Savaii (652.9 square miles), Upolu (335.5), Manono (3.3), and Apolima (1.8). Germany acquired the islands in 1900. The administrative headquarters is at Apia, in Upolu. The native colored population is estimated at 35,000; other colored, about 3500, of whom about 2100 Chinese; whites in 1914, 600, of whom 373 German and 140 British. There are one Protestant and one Roman Catholic missionary society represented in German Samoa. Trade returns, in thousands of marks: imports and exports respectively, in 1912, 4994 and 5045; in 1913, 5676 and 5339; imports from Germany in 1912 and 1913, 986 and 1199; exports to Germany, 2536 and 2973; copra export in 1912 and 1913, 4070 and 4121; cacao, 840 and 1063; rubber, 111 and 91.

The budget for 1915-16, as well as the budget for 1914-15, balanced at 1,374,354 marks, the estimated revenue consisting wholly of local receipts.

On Aug. 29, 1914, British colonial troops occupied Apia. During the war German Samoa is administered by New Zealand. See GERMAN PROTECTORATES.

**GERMAN SOUTHWEST AFRICA.** A protectorate of Germany (see GERMAN PROTECTORATES) between Angola (Portuguese) and the Cape Province of the Union of South Africa (excepting Walfish Bay, which belongs to the Cape Province). Windhuk is the administrative headquarters of the protectorate, which was established in 1884. The estimated area is 835,100 square kilometers (322,432 square miles); of the German protectorate, Southwest Africa is the largest excepting East Africa. The population is sparse, the estimated number of native colored inhabitants being about 81,000; other colored, 3000; white (Jan. 1, 1913), 14,330, of whom 12,292 Germans. Two Protestant and two Roman Catholic missionary societies are represented in the protectorate. Stock raising and mining (diamonds, copper) have hitherto been commercially more important than agriculture. The reported number of cattle decreased from 90,385 in 1903 to 52,531 in 1907 and then steadily increased to 205,643 in 1913. Other live stock in 1913 included 15,916 horses, 13,618 mules and asses, 53,691 wool sheep, 17,171 Persian sheep, 11,194 karakul, 472,585 mutton sheep, 485,401 goats, and 31,503 Angora goats. Diamonds are found in the vicinity of Lüderitzbucht; production in 1911-12, 766,465 carats. Trade returns, in thousands of marks: imports and exports respectively in 1912, 32,499 and 39,035; in 1913, 43,428 and 70,302; imports from and exports to Germany in 1912, 26,442 and 32,454; diamond export in 1912 and 1913, 30,414 and 58,910; copper ore, 6523 and 7929; tin ore, 9 and 632; hides and skins, 298 and 521; wool, 150

and 126. The export of copper ore amounted to 42,775 metric tons in 1912 and 47,345 in 1913.

In German Southwest Africa there were 1318½ miles of state-owned and 129½ miles of privately-owned railway previous to the war, which were increased during hostilities by a total length of 215 miles, constructed by British forces. In addition to the 100 miles between Swakopmund and Usakos converted to the Union of South Africa standard gauge of 3 feet 6 inches, the Union Railway Administration, on the instructions of the South African government, took over all these railways, but was of the opinion that the lines in question were not likely to be a source of revenue for many years.

The budget for 1915-16, as well as the budget for 1914-15, showed estimated revenue of 47,820,875 marks and estimated expenditure of 47,820,338 marks; estimated local receipts were 28,199,450 marks, imperial contribution, 12,140,013, and loan 7,480,865.

German Southwest Africa was finally conquered by South African forces under Gen. Louis Botha in July, 1915, and is administered by the Union of South Africa.

**GERMANY.** The German Empire is a constitutional monarchy, consisting of 25 federated states and an imperial territory (Reichsland). The capital is Berlin.

**AREA AND POPULATION.** Germany's area is 540,857.5 square kilometers, exclusive of the Baltic and North Sea lagoons and the German part of the Lake of Constance. The equivalent in square miles is 208,825.2, as compared with 207,129 square miles for France and 208,770 square miles for the States of Maine, New Hampshire, Vermont, Massachusetts, Connecticut, New York, New Jersey, Pennsylvania, and Ohio. The estimated population June 30, 1914, a month before the outbreak of the great war, was 67,810,000.

The German customs territory (Zollgebiet) includes the grand duchy of Luxemburg and the Austrian communes of Jungholz and Mittelberg and excludes the free port of Hamburg, a part of the commune of Cuxhaven, the territories of the free ports of Bremen, Bremerhaven, and Geestmünde, the island of Helgoland, and several communes of the Grand Duchy of Baden on the Swiss frontier. The area of the customs territory is 543,354 square kilometers, or 209,789 square miles; the estimated population June 30, 1914, was 68,059,000.

The area of the empire in square miles, and the population according to the census of Dec. 1, 1900, and the census of Dec. 1, 1910, are shown by states in the table below (*k* kingdom, *g* grand duchy, *d* duchy, *p* principality, *fc* free city, *r* Reichsland); under Prussia are shown the constituent provinces and the territory of Hohenzollern, and under Bavaria are shown Bavaria proper and the detached Palatinate, which is west of the Rhine.

<b>Total</b>	<b>208,825.2</b>	<b>56,367,178</b>	<b>64,925,993</b>

One hundred years ago (that is, in 1816), the population of the territory now embraced within the empire was 24,833,000. It had increased in 1871, after the Franco-Prussian War, to 41,058,792. From 1871 to 1910, the increase was 58.1 per cent, and from 1900 to 1910 14.1 per cent.

According to the 1910 census, males numbered 32,040,166, and females 32,885,827. In view of the great war, it is interesting to note that the number of males returned by the 1910 census as having been born between the years 1869 and 1896 inclusive, is 11,936,803; that is, this is the number of males who, barring deaths from Dec. 1, 1910, would be from 18 to 45 years of age in 1914.

Foreigners at the 1910 census numbered 1,259,880 (716,889 males, 542,991 females); there were 634,989 Austrians, 144,181 Dutch, 137,668 Russians (including Finns), 104,265 Italians, 68,233 Swiss, 32,087 Hungarians, 26,238 Danes, 19,137 French (including colonials), 18,319 British (including colonials), 17,555 Americans (including Filipinos, Porto Ricans, and Hawaiians), 14,356 Luxembourgish, 13,449 Belgians, and 9671 Swedes.

German population has increased far more rapidly in the urban communes than in the rural communes (a rural commune is one that has less than 2000 inhabitants). In 1871 the rural communes had 63.9 per cent of the population, in 1900 45.6 per cent, and in 1910 40.0 per cent. In 1910 there were 576 communes with over 10,000 inhabitants each, and 48 with over 100,000 each. The aggregate population of the 48 communes was 21.3 per cent of the total population of the country—the population of such communes in 1900 was 16.2 per cent of the total, and in 1871 only 4.8 per cent. The popu-

lation of Berlin Feb. 1, 1916, is reported at 1,928,418. The communal population of the larger cities was returned as follows by the 1910 census: Berlin, 2,071,257; Hamburg, 931,035; Munich, 596,467; Leipzig, 589,850; Dresden, 548,308; Cologne, 516,527; Breslau, 512,105; Frankfurt am Main, 414,576; Düsseldorf, 358,728; Nuremberg, 333,142; Charlottenburg, 305,978; Hanover, 302,375; Essen, 294,653; Chemnitz, 287,807; Stuttgart, 286,218; Magdeburg, 279,629; Bremen, 247,437; Königsberg, 237,289; Neukölln (formerly Rixdorf), 237,289; Stettin, 236,113; Duisburg, 229,483; Dortmund, 214,226; Kiel, 211,627; Mannheim, 193,902; Halle, 180,843; Strassburg, 178,891.

Of the population in 1910, Evangelicals numbered 39,991,421 (61.59 per cent); Roman Catholics, 23,821,453 (36.69); other Christians, 283,946 (0.44); Jews, 615,021 (0.95); others, 214,152.

The birth rate per thousand inhabitants fell from 36.8 in 1900 to 28.3 in 1913, and the death rate from 23.2 to 15.8; stillbirths per hundred births declined from 3.1 to 2.9, and illegitimate births per hundred births increased from 8.7 to 9.7. In 1913, births and deaths numbered 1,894,598 and 1,060,798 respectively (both figures including stillbirths, which numbered 55,848), the excess of births over deaths being 833,800; the excess of births over deaths was 839,887 in 1912, 739,945 in 1911, and 879,113 in 1910.

German overseas emigrants in 1913 numbered 25,843, and foreign emigrants from German ports 413,057; in 1914, 11,803 and 150,416. Of the German emigrants in 1914, 9614 were bound for the United States, 580 for Canada, and 232 for Australia; of the foreign emigrants from German ports, 131,938 were bound for the United States.

**EDUCATION.** The degree of illiteracy in Germany is almost negligible. Elementary instruction is compulsory throughout the Empire, the school age being from 6 to 14. The latest available statistics for elementary and middle schools relate to 1911. In that year, the public elementary schools numbered 61,557, with 187,485 teachers (148,217 male, 39,268 female) and 10,309,949 pupils (5,157,446 males, 5,152,503 female). In addition, there were 480 private elementary schools, with 26,151 pupils (11,894 male, 14,257 female). Middle schools in 1911 numbered 2049, of which 914 were public and 1135 private. The public middle schools had 7531 teachers (5147 male, 2384 female) and 273,394 pupils (135,799 male, 137,595 female); the private middle schools had 4534 teachers (1131 male, 3403 female) and 80,660 pupils (21,873 male, 58,787 female). Total number of pupils in the elementary and middle schools public and private, 10,690,154.

Institutions for secondary, higher, technical, and professional instruction are numerous and highly organized. More recent statistics than those given in the 1915 YEAR BOOK are not available. The great war has interfered with the course of instruction at these institutions, as may be inferred from the fact that the university enrollment declined from 70,024 in the winter semester of 1913-14 to 56,644 in the winter semester of 1914-15.

**AGRICULTURE.** Although German agriculture prior to the great war had reached a high

state of intensive development, it could not meet the demands, except with respect to certain crops, of a dense population that was increasing by some 800,000 a year. For many years the trend of population had been markedly cityward, that is, the urban population had been increasing far more rapidly than the rural. The number of persons supported by agriculture decreased from 18,501,307 in 1895 to 17,681,176 in 1907, while the percentage decreased from about 35.8 to about 28.6.

In 1913, arable land, including gardens, amounted to 26,059,200 hectares (about 48.2 per cent of the area of the country); meadow, 5,991,700 (11.1 per cent); pasture, 2,592,500 (4.8); vineyard, 118,600 (0.2); woodland, 14,223,200 (26.3). Statistics of sowings and harvests later than for 1914 have not been available during the war. According to newspaper reports, the potato yield of 1916 (potatoes and rye are the most important crops) was only about half the normal. In 1913 and 1914, the area in hectares and the yield in metric tons of cereal crops, potatoes, and hay were as follows:

	Hectares		Metric Tons	
	1913	1914	1913	1914
Wheat . . . . .	1,974,098	1,996,100	4,655,956	8,971,995
Rye . . . . .	6,414,143	6,298,956	12,222,894	10,426,718
Barley . . . . .	1,654,020	1,581,999	3,673,254	8,187,988
Oats . . . . .	4,438,209	4,888,146	9,713,965	9,038,185
Spelt . . . . .	272,493	269,135	438,469	370,565
Potatoes . . . . .	3,412,201	3,386,098	54,121,146	45,569,559
Hay . . . . .	5,923,647	5,784,964	29,184,994	29,156,024

For the 10-year period 1903-14, the average yield of wheat per hectare was 20.7 metric quintals; rye, 17.2; barley, 19.8; oats, 19.0; spelt, 14.7; potatoes, 135.1; hay, 43.0. The share of Prussia in the 1914 production was: wheat, 2,521,263 metric tons; rye, 8,098,553; barley, 1,806,704; oats, 6,067,589; spelt, 18,787; potatoes, 33,040,026; hay, 14,011,645.

Live stock as reported for December 1st, with percentage of decrease from 1914 to 1915:

	1913	1914	1915	P.c.
Horses * . . . . .	3,435,283	3,341,627	2.7	
Cattle . . . . .	20,994,344	21,828,783	20,316,948	6.9
Sheep . . . . .	5,520,837	5,471,468	5,073,478	7.3
Goats . . . . .	3,548,384	3,588,414	3,488,296	2.8
Swine . . . . .	25,659,140	25,341,272	17,287,211	31.8

\* Exclusive of horses used in the army.

The following figures relate to December 1st of 1914 and 1915 respectively: cows and heifers above two years old, 11,320,992 and 10,970,009 (decrease 3.1 per cent); bulls and oxen above two years old, 1,579,850 and 1,493,079 (5.5); young stock from three months to two years of age, 6,858,139 and 6,457,093 (5.8); calves under three months, 2,069,802 and 1,396,767 (32.5); swine above one year old, 2,944,036 and 2,353,194 (20.1); swine six months to one year old, 7,701,905 and 5,346,727 (30.6); swine under six months, 14,695,331 and 9,587,290.

The slaughter of live stock in 1913 and 1914 respectively is reported as follows: oxen, 518,244 and 546,330; bulls, 498,138 and 575,761; cows, 1,633,561 and 1,619,932; young cattle over three months old, 879,032 and 889,634; calves up to three months, 4,088,445 and 3,850,263; sheep, 2,092,989 and 1,869,847; goats, 469,798 and 509,488; swine, 17,872,028 and 19,-

441,273; horses, 163,282 and 117,824; dogs, 7356 and 6884.

**FISHERIES.** In 1912 and 1913 respectively, the value of the North Sea catch was 30,984,600 and 34,611,200 marks; Baltic catch, 10,582,100 and 10,378,200; total, 41,566,700 and 44,989,400. See AGRICULTURE.

**MINERALS AND METALS.** German mining and foundry statistics include those of the grand duchy of Luxemburg. The reported coal production in 1915 is reported at 146,712,350 metric tons, as compared with 161,535,224 tons in 1914; lignite, 88,369,554 tons in 1915 and 83,946,906 in 1914. The principal minerals raised in 1913 included the following: coal, 191,511,154 metric tons; lignite, 87,233,084; iron ore, 28,607,903; copper ore, 947,757; zinc ore, 641,549; lead ore, 110,153; rock salt, 1,391,738; potassium salts, 13,306,312.

The reported output of pig iron in 1915 was 13,163,188 tons, as compared with 14,389,547 tons in 1914 and 19,291,920 in 1913; ingot steel production in 1915, 13,163,188 tons, as compared with 14,872,467 in 1914. The following figures show output in 1912, in metric tons: pig iron, 15,220,900; zinc, 313,600; lead, 165,000; copper, 45,000; silver, 895.8; gold, 43.4; tin, 10,600; sulphuric acid, 1,649,700.

**COMMERCE.** The German customs territory is defined above under *Area and Population*, second paragraph. On account of the great war, Germany has not published commercial statistics for any year later than 1913. But it is clear from the returns of other countries that the German overseas trade has shrunk to a negligible amount. Germany's expanding trade before the war may be seen in the tables below. The following shows, in millions of marks, the total foreign commerce, except goods in transit:

Imports:	1910	1911	1912	1913
Merchandise .....	9,585.1	10,880.0	11,572.4	11,654.8
Coin and bullion..	555.0	297.3	827.4	441.8
<b>Total .....</b>	<b>10,090.1</b>	<b>10,677.3</b>	<b>11,899.8</b>	<b>12,096.1</b>
Exports:	1910	1911	1912	1913
Merchandise .....	8,079.7	8,773.9	9,684.2	10,891.8
Coin and bullion..	352.9	118.3	142.9	102.8
<b>Total .....</b>	<b>8,432.6</b>	<b>8,892.2</b>	<b>9,827.1</b>	<b>10,994.6</b>

The special trade, that is, imports for consumption and exports of German produce, has been as follows, in millions of marks:

Imports:	1910	1911	1912	1913
Merchandise .....	8,934.1	9,705.7	10,691.8	10,769.7
Coin and bullion..	875.9	301.3	325.7	436.4
<b>Total .....</b>	<b>9,810.0</b>	<b>10,007.0</b>	<b>11,017.5</b>	<b>11,206.1</b>
Exports:	1910	1911	1912	1913
Merchandise .....	7,474.7	8,106.1	8,956.8	10,097.2
Coin and bullion..	169.5	118.3	142.7	101.4
<b>Total .....</b>	<b>7,644.2</b>	<b>8,224.4</b>	<b>9,099.5</b>	<b>10,198.6</b>

By great classes, imports for consumption and exports of German merchandise were valued as follows, in millions of marks:

	Imports		Exports	
	1912	1913	1912	1913
Raw materials ...	4,823.2	5,008.0	1,882.4	1,518.1
Partly manufac- tured materials .	1,256.8	1,289.0	1,012.9	1,139.4
Manufactures ....	1,410.9	1,478.8	5,768.2	6,896.3

	Imports		Exports	
	1912	1913	1912	1913
Food substances ..	2,944.9	2,759.2	789.4	1,036.0
Live animals ....	256.0	289.7	8.9	7.4
<b>Total .....</b>	<b>10,691.8</b>	<b>10,769.7</b>	<b>8,956.8</b>	<b>10,097.2</b>

In the special trade, imports of merchandise from the United States and exports of merchandise thereto were valued in 1913 at 1711.5 and 713.2 million marks respectively; Russia, 1424.6 and 880.0; United Kingdom, 876.1 and 1438.2; Austria-Hungary, 827.3 and 1104.8; France, 584.2 and 789.9; British India, 541.8 and 150.7; Argentina, 494.5 and 265.9; Belgium, 344.6 and 551.0; Netherlands, 333.0 and 693.5; Italy, 317.7 and 393.5; Australia, 296.1 and 88.5; Brazil, 247.9 and 199.8.

**SHIPPING.** In the German shipping records a vessel is counted as entered and cleared only once for each voyage although it may touch at several ports. In 1913, there were entered at the ports 115,966 vessels, of 34,772,177 tons (registered), and cleared 117,375, of 34,921,806 tons; in 1912, 114,407 vessels, of 32,541,458 tons, entered, and 113,931, of 32,606,653 tons, cleared. The number of steamers entered in 1913 was 76,551, of 31,307,049 tons, and cleared 77,143, of 31,421,344 tons. Of the total in 1913, German vessels entered numbered 89,329, of 21,231,342 tons, and cleared 90,456, of 21,276,587 tons. British vessels entered in 1913, 5285, of 6,178,714 tons; Swedish, 5931, of 2,172,577 tons; Danish, 8101, of 1,703,232 tons; Norwegian, 2184, of 1,356,681 tons; Dutch, 3635, of 1,022,585 tons. Entered at Hamburg in 1913, 14,054 vessels, of 13,141,362 tons, or about 37.8 per cent of the total shipping entered.

The following figures for the merchant marine exclude vessels having a capacity of less than 50 cubic meters (17.65 tons gross). On Jan. 1, 1914, the merchant marine numbered 4935 vessels of 3,320,071 registered tons net, as compared with 4850 vessels of 3,153,724 tons in 1913, and 4658 of 2,859,307 tons in 1910. Of the total in 1914, 2170 were steamers, of 2,832,312 tons. Registered at North Sea ports, 3948 vessels, of 2,988,216 tons, and at Baltic ports 987, of 331,855 tons. Registered at Hamburg, 1466 vessels, of 1,908,279 tons (of which 822, of 1,640,828 tons, steam).

**COMMUNICATIONS.** The total length of railway reported as in operation March 31, 1915, was 64,195 kilometers (39,889 miles), of which 59,518 kilometers were state railway and 4677 kilometers private railway, and 61,977 kilometers normal gauge and 2218 kilometers narrow gauge. The table below shows in kilometers the length of normal and narrow gauge railway belonging to each of the state systems and the length of private railway:

By Systems of	Normal	Narrow	Total
Prussia-Hesse .....	39,576	239	39,815
Bavaria .....	8,333	115	8,448
Saxony .....	2,837	511	3,348
Württemberg .....	2,002	101	2,103
Baden .....	1,826	28	1,854
Mecklenburg .....	1,094	...	1,094
Oldenburg .....	674	...	674
Alsace-Lorraine .....	2,081	80	2,111
Prussia (Royal Military Ry.) ..	71	...	71
<b>Total state ry. ....</b>	<b>58,444</b>	<b>1,074</b>	<b>59,518</b>
<b>Private railway .....</b>	<b>8,538</b>	<b>1,144</b>	<b>4,677</b>
<b>Total railway .....</b>	<b>61,977</b>	<b>2,218</b>	<b>64,195</b>

The official report of the German railways for the financial year ended March 31, 1915, was issued in 1916. This year included the first eight months of the war, and under all heads the receipts diminished, the only item of increase being in the total expenses, which rose, both relatively and absolutely, from 2,490,400,000 marks to 2,513,200,000 marks. For the year they stood at 80.19 per cent of the total receipts, against 70.03 per cent in the previous year.

German state railway system under the leadership of Prussia. Accordingly, before the war and up to 1916, the only imperial railways in the German Empire were those in Alsace-Lorraine, and the only state which had allowed its railways to come under the direct control of Prussia was Hesse, whose lines form a section of the system officially known as the Prussian-Hessian railway administration. During 1916 Prussia proposed that the temporary "imperialization" of the war should be placed on

German state railways .....		36,315	
Private railways .....		2,206	
Prussian-Hessian railways .....		24,591	

The capital laid out by the owners of the railways amounted to 19,835,300,000 marks, of which 19,464,400,000 marks were debited to the state railways and 370,900,000 marks to the private railways. These work out respectively to \$125,000 per mile and \$42,000 per mile. The total length of the German state railways open for traffic at the end of the year was 36,315 miles, and that of the private railways 2206 miles. The Prussian-Hessian state railways comprised 24,591 miles. Of the German state railways 22,000 miles were worked as main lines, while 23,000 miles were single lines, 15,000 miles double lines, 45 miles triple lines, and 250 miles quadruple lines.

At the end of the financial year the rolling stock comprised 30,633 locomotives, an increase of more than 1100, 20,067 tenders, 67,491 passenger cars, and 719,555 freight and baggage cars. The aggregate outlay for the stock is put at \$1,257,850,000. The cost of construction of the railways is taken as \$5,051,750,000, or \$130,000 per mile.

The receipts from passengers and baggage amounted to 26.66 per cent of the total, while those from freight were 65.02 per cent.

The number of officials and men employed by the ordinary gauge railways during 1913-14 amounted to 764,028 persons, against 786,466 persons for the previous year, or about 20 per mile. In salaries, wages, etc., were paid 1,394,600,000 marks, against 1,351,400,000 marks for the preceding year.

At the beginning of the war, the various German states which control individual railway systems, such as Bavaria and Württemberg, agreed to the "imperialization" of all the railways within the Empire as a war-time measure, and under such conditions they were operated with considerable efficiency. These states from the outset were jealous of Prussian predominance for they had never been willing to participate in Bismarck's dream of an imperial

a permanent basis, but Württemberg lost no time in vetoing the scheme, pointing out that the existing conditions are only for the duration of the war. It was believed that Bavaria, also Saxony and the Palatinate, would make a similar refusal, but that the Berlin government would later attempt to carry through the plan.

Receipts of the Prussian state railways for the transportation of freight in the second year of the war exceeded by 5 per cent the former high record, made in 1913. The receipts in 1915 were \$417,802,800, as compared with \$359,443,800 in 1914, and \$398,032,200 in 1913. Receipts for the transportation of passengers and freight in 1915 exceeded those of the previous year by \$2,620,000. In the first half of 1916 there was a further increase of more than 5 per cent in the revenue from transportation of passengers and freight.

State telegraph lines in 1913 totaled 238,493 kilometers, with 765,327 kilometers of wire and 41,685 offices. In addition to the state telegraphs, there are railway telegraph lines and some private lines; these had 8328 offices in 1913. Post offices in 1913, 41,415. The imperial administration of posts and telegraphs embraces all the German states except Bavaria and Württemberg; these kingdoms operate, under certain limitations, their own postal and telegraph systems. Places (towns, etc.) having telephonic communication, 41,087.

FINANCE. The standard of value is gold. The monetary unit is the mark; its par value is 23.821 cents. For the fiscal year 1917, the estimated ordinary revenue and expenditure of the Empire balanced at 3,659,261,939 marks; extraordinary revenue and expenditure, 99,213,530 and 87,507,853; total, 3,758,475,469 and 3,746,769,792. These estimates are exclusive of war credits and of expenditure on army and navy. Imperial revenue and expenditure in the fiscal year 1913 and the estimates for 1914

(including supplementary estimates), 1915, and 1916 have been as follows, in thousands of marks:

	1913	1914	1915	1916
<b>Revenue:</b>

The larger sources of estimated ordinary revenue for the fiscal year 1916: general administration of finance (which includes customs, excise, and stamps), 1,701,282,900 marks; posts and telegraphs, 881,569,500; military contribution, 327,740,881; railways, 79,822,732. The larger estimated ordinary expenditures for the same year: service of the imperial debt, 1,273,729,123 marks; post and telegraphs, 784,017,554; military administration, 515,965,111; pensions, 145,316,708; naval administration, 142,116,451; railway administration, 132,090,451; interior, 122,703,851; general administration of finance, 98,078,647. The estimated extraordinary expenditure on account of the great war (to be raised by loans), 10,300,000,000 marks for 1914, 10,000,000,000 marks for 1915, and 20,000,000,000 marks for 1916.

Aside from the expenditure imposed by the war, the expenditures of the constituent states reach an aggregate amount far larger than the imperial expenditure. The estimated ordinary revenue and expenditure of Prussia for the fiscal year 1916 were 4,758,746,629 and 4,561,048,778 marks respectively; the total estimated revenue and expenditure of Prussia balanced at 4,816,363,929 marks.

The interest-bearing debt of the Empire increased from 4,897,225,300 marks on Oct. 1, 1913, to 4,980,394,300 marks on Oct. 1, 1914, and to 26,014,890,900 marks on Oct. 1, 1915. The non-interest-bearing debt in 1913 and 1914 was 280,000,000 marks. On Oct. 1, 1915, there was a debt of 7,482,000,000 marks of treasury bills free of interest. GOVERNMENT. The German Empire is a federation of states under a constitution bearing date of May 4, 1871, and amended March 19, 1888. The executive power is vested in the King of Prussia as German Emperor, who is authorized to conclude treaties, to declare war (if defensive) and peace, and to appoint and receive diplomatic representatives. The Emperor in 1916 was William II, who was born Jan. 27, 1859, and succeeded his father (Emperor Frederick III) June 15, 1888. The heir apparent, or crown prince, is Prince Frederick William, who was born May 6, 1882.

The legislature consists of the Bundesrat, or Federal Council, and the Reichstag. Members of the Bundesrat (61 in number) represent the constituent states and are appointed for each session by their respective governments. Members of the Reichstag represent the German nation and are elected for five years by direct manhood suffrage.

The imperial ministers, or secretaries of state, do not form a ministry responsible to the legislative branch of the government, but act independently of each other under the general supervision of the imperial chancellor. The chancellor, who is also president of the Bundesrat, is the highest official of the Empire; he is appointed by the Emperor without regard to party strength in the Reichstag, and to the Emperor he is directly responsible. The imperial chancellor in 1916 was Theobald von Bethmann-Hollweg (from July 14, 1909, succeeding Prince von Bülow); he is also Prussian prime minister. Imperial secretaries of state in 1916: Foreign affairs, Gottlieb von Jagow, who succeeded Alfred Kiderlen-Waechter, who died Dec. 30, 1912, and was followed in December, 1916, by Dr. Alfred Zimmermann; interior, Karl Helfferich (succeeding Klemens Delbrück in 1916); war, Lieutenant-General von Stein who succeeded Lieutenant-General von Hoffman in October; marine, Admiral Edouard von Capelle (appointed March 16, 1916, in succession to Grand Admiral Alfred von Tirpitz); justice, Hermann Lisco (from Nov. 1, 1909); treasury, Count Siegfried von Roeder (succeeding Karl Helfferich in 1916); posts and telegraphs, Reinhold Kraetke (from 1901); colonies, Wilhelm Solf (from Dec. 20, 1911). See articles COÖPERATION; PRICES.

## HISTORY

THE SOCIALISTS. The majority of the Social Democrats continued firm for the government. Dr. Liebknecht, however, who had so long been prominent as a critic of the war policy, again occasioned difficulty in the Reichstag, during the session of January 11th, by submitting questions as to the state of the inhabitants of the occupied territory, and as to the government's measures in the matter of the state of siege. In answer to the first question the ministerial director declared that the government could not go into particulars before the Reichstag, but that information would be given at the sitting of the budget committee. To the second request the government refused to give the desired information. On January 13th a caucus of the Socialist party voted by 60 to 25 to deprive Liebknecht of his rights of membership on account of his violation of the party decisions. But the number of those who objected were more numerous than these figures indicated because there were 25 absentees, of whom 12 were said to favor his retention. In the same way the patriotic element dominated the party in respect to the course of the party journal *Vorwärts*, which had been censured for its pacifist attitude, and a committee of the party repudiated that journal as its organ. Nevertheless, the newspaper refused to change its policy. Finally, however, there was a split in the party. On March 24th Herr Haase was expelled by the Social Democratic party and at the same time 18 pacifist members left it. There was thus a new pacifist Social Democratic Labor group led by Haase and Ledebour. Liebknecht and Ruhle would have nothing to do with either faction, and there was still another group, about 20 in number, known as the "Hoch-Simon" group, which, while remaining under party discipline, refused to vote the war credits. Thus the war

party among the Social Democrats had only a majority of 70. The protests of the Social Democratic Labor group against the war became more and more vigorous and Dr. Liebknecht's activities went further yet, resulting in his arrest and sentence to 30 days' penal servitude for an inflammatory address at the May Day demonstrations in Berlin. He was charged with attempted high treason, insubordination, and resistance to the authorities. The penalty was the minimum, the court having regarded the political fanaticism of the accused as an extenuation. There were demonstrations of sympathizers in Berlin and elsewhere when the sentence became known. Before Liebknecht's arrest he had attempted to make a speech in the Reichstag on the reasons for Germany's entrance into the war, in the course of which he sought to prove that they were the reasons which the Entente Allies alleged. He was forbidden to make this speech, but it was subsequently published in pamphlet form. One of the charges which Dr. Liebknecht was said to have made against the government was that Austria had been forced by the Potsdam party into the war against the will of the authorities at Vienna and at Budapest. This report caused much scandal in Germany. Dr. Liebknecht had been prominent for his objection to the government during several years. In 1907 he had been tried for high treason in Leipzig on the basis of an anti-militaristic pamphlet which he had published, and was sentenced to eight months in a military prison. In 1912 he had attracted public attention by his attack on the Prussian and Hessian authorities for permitting the Czar to visit Germany, and in 1913 he had accused the German war party of bribery plots in which the Krupps were concerned. During the war he had been one of the most vigorous opponents of militarism.

**ECONOMIC CONDITIONS.** From the press of the Entente Allies, it appeared that Germany was suffering serious privations as a result of the British blockade, and the war measures of finance were declared by British economists to rest on an insecure basis. Among the indications which were said to prove bad economic conditions were the severe regulations as regarded food, the complaints of many journals of the high food prices, the repeated rumors (denied in German sources) of hunger riots, the embargo on all luxuries, and especially the increasing efficiency of the blockade. Also the mark exchange on March 13th had fallen in New York to 73. Trade with the United States was estimated to have fallen off 92 per cent. In the spring reports of bread riots became more frequent. At the same time, the Reichstag and the German public revealed anxiety as to the food situation. The Socialists demanded more vigorous administrative regulation and measures for the restriction of speculation and extravagance.

**THE FOOD DICTATORSHIP.** On May 23rd it was announced that what amounted to a food dictatorship had been created. The first to hold the office was Herr von Batocki, who was appointed chairman of a food regulation board with wide discretionary powers as to the regulation of the supply, consumption, and sale of food. At the same time the government declared that adequate measures had been taken for the nourishment of the people, and that the

appointment of a food dictatorship was due solely to the scarcity of meats, and to the bad crops of 1915. In June there were frequent reports of food difficulties. Riots in Munich and Essen in which women took part were reported. They were said to have raided the shops where food was sold. Among the first measures of the new administrator were the establishment of soup kitchens in the large centres and the introduction of meat cards. After investigating the situation as regards the food supply he announced that while the prospect for the supply of potatoes was unfavorable, there was still sufficient wheat. He also issued an order that the eating of meat must cease for eight weeks. In regard to the supply of potatoes it was reported at the close of the year that the crop was only two-fifths of that harvested the year before and that there had been as serious a falling off in quality as in quantity. It was impossible to obtain exact details in regard to the scarcity of provisions, but reports and rumors indicated toward the close of the year that conditions were becoming more serious. According to the *Tägliche Rundschau* of Berlin, there had been a great scarcity of bread for weeks and also a scarcity of potatoes, and this despite the fact that the cereal crops were better in 1916 than in the year before. Fish, which had latterly become an important article of diet everywhere, was growing so costly that the greater part of the population had to give it up. Smoked fish cost six times as much as before the war and there was no fresh fish to be had. The same journal went on to say that the harvest of vegetables in Germany, especially in Berlin, had been very abundant. Yet in almost all quarters of the city all kinds of vegetables had disappeared; only potatoes were offered for sale, and their price was constantly increasing. The official explanation was the lack of means of cartage. From sources hostile to Germany many similar indications were cited, especially in French and English journals which published many notes of prisoners complaining of the scarcity of food.

**CIVIL MOBILIZATION.** The systematic direction of industries in war time, already carried further in Germany than in any other belligerent country, was advanced toward the end of the year by some very radical measures, especially by the Patriotic Auxiliary Service Law passed by the Reichstag on December 2nd. In general, the new methods looked to the centralization of all classes of work that had any relation to the war. There was, it was said, no scarcity of raw materials, but it was necessary to control absolutely the labor required for their manufacture. Methods analogous to those employed in the army were applied to the industrial forces of the country, which became in effect a military organization.

The main features of the Patriotic Auxiliary Service Law were as follows: All German males between 16 and 60 years of age not yet called to the colors were subject to patriotic auxiliary service, that is to say, to service in war industries, agriculture, nursing the sick, in short, in any occupation or undertaking directly or indirectly concerned with the conduct of the war. The new service was under the War Office in the Prussian Ministry of War. Provisions for the carrying out of the act were to be issued by the Federal Council and it was to be

enforced under pain of fine or imprisonment. The control was entirely in military hands. Appeals were to be heard by a central committee consisting of two officials of the War Office, two appointed by the imperial government, and one chosen by the state whose subject was concerned. It was announced that at first as a rule the authorities would rely on a call for volunteers, but if the results were inadequate compulsory written calls would be issued. The law was to go into effect at once and to remain in force at the will of the Federal Council. General Gröner was placed in charge of the work. Under him were two chiefs of staff, a military chief and a technical chief, the latter being the well-known industrial magnate, Dr. Kurt Sorge, of Magdeburg. Under them in turn were sections corresponding to the respective branches of industry: metallurgical, mines, chemical, powder-manufacturing, agricultural, and labor. Manual labor was to be equitably apportioned and delegates were to represent the working-men. The War Office was represented in the provinces by several branches, for example, at Düsseldorf for the Westphalian Rhine basin, and at Metz for Lorraine and Luxemburg.

In the debate on the Patriotic Auxiliary Service bill the Socialist proposal of permanent workmen's committees for industrial establishments and railways had been rejected. In the discussion Socialist speeches attacked the government for its course in deporting Belgian workmen (see *BELGIUM, History*).

**PEACE DISCUSSION.** The opposition of certain groups among the Socialists is noted above. Many of them were bitterly opposed to the annexation of territory. On the other hand, the extreme war party demanded that all conquered territory should be annexed. Chancellor Bethmann-Hollweg chose the middle ground between these extremists, saying in his speech of April that while Poland, Lithuania, and Livonia should be taken from Russia, European questions in general should be settled peacefully after the war. Later he reproached the Entente Allies for rejecting peace. In the course of his address he incidentally promised that the censorship would be relaxed. The Chancellor's attitude met with the hearty approval of the patriotic Socialists, the Progressives, the Centre, and the moderate groups in general. On June 20th the Social Democrat Scheidemann declared that the Chancellor had said that he disapproved the plans for annexing Belgium and Northern France, whereupon the Pan-Germans protested against too easy peace terms. A National Committee, was formed in July in the interest of honorable peace on moderate terms. This was under the nominal leadership of Count von Wedel. The Chancellor showed the same moderate attitude toward the submarine controversy, in which he insisted on maintaining friendly terms with the United States in spite of the angry demands of the Conservatives and National Liberals. The retirement of Grand-Admiral von Tirpitz March 16th was taken as a proof of this moderate policy. The latter was succeeded as secretary of state for the navy by Vice-Admiral Eduard von Capelle.

The motives of the German government in its move for peace at the close of the year (see *WAR OF THE NATIONS*) are indicated by a letter of the Kaiser addressed to his Chancellor

on Oct. 21, 1916, in which he said: "Since I have seen you, I have gone over our conversation in my mind. It is clear that the people in enemy countries who have been led to endure the sufferings of war by means of lies and deceit, and who are misled by the struggle and by hate, have no one who is able or who has the moral courage to pronounce the necessary words to propose peace. What is needed is a noble, moral initiative that will deliver the entire world, including the neutrals, of the terrible weight that is crushing down us all. For this act there is need of a sovereign who has a conscience, who feels his responsibility before God, and whose heart beats for his people and for those who are his enemies, who is indifferent to malicious interpretation of his acts, and who has the will to deliver the world from these sufferings. I possess this courage. Trusting in God, I shall venture to take this step. Recast the notes in this sense and submit them to me. Make without delay all the necessary preparations."

**PROMISE OF POLISH AUTONOMY.** On November 5th Governor-General von Beseler read to Polish representatives assembled at the Royal Palace at Warsaw, a manifesto declaring that the Emperors of Germany and Austria-Hungary had agreed to form out of the districts conquered from Russia a national state with a hereditary monarchy and constitutional government. The exact frontiers were to be defined later. The new state was to have a national army whose command would be arranged later by common agreement. In his address after reading this proclamation the Governor-General expressed the hope that soon a Polish army would be fighting on the side of the Central Powers. The Emperor Francis Joseph announced his agreement to this promise in a letter addressed to the Austrian Premier, in which he said that upon the formation of the new state Galicia should also have the right to self-government so far as it was consistent with its status as a part of the Austro-Hungarian commonwealth. The promise of Polish independence was regarded by the Entente Allies as a mere maneuver to secure further recruits among the Poles. It was said that Germany hoped to raise an army of 500,000 men by this measure. A large number of the Poles themselves were suspicious, and leading Poles considered the measure unsatisfactory even if carried out, demanding an independent and united Polish state made up of the Polish parts of Austria, Germany, and Russia. On the other hand, German authorities declared the promise to be a "solemn and irrevocable guarantee." See *WAR OF THE NATIONS*.

**WAR FINANCE.** War appropriations at the close of the preceding year had risen to about 40,000,000,000 marks. The payments on the third war loan were completed in January, making a total of 12,160,000,000 marks. In the same month a fourth loan was issued, to which more than 5,000,000 subscribed, soon bringing the amount to 10,712,000,000 marks. Germany also made loans to her allies. At the close of the preceding year the Finance Minister announced that a war profit tax would be levied upon gains from January, 1914 to 1917, and any one whose profits had been increased by the war was required to hold back 50 per cent for the payment of the tax. In spite of the finan-

cial strain upon the country, the Reichstag on January 11th voted for the reduction for old age pensions from 70 to 65 years. For a general summary of war finance measures during the year, see article FINANCIAL REVIEW.

**OTHER EVENTS.** On January 13th the Prussian Landtag was opened. In his address the Chancellor promised electoral reform, but said that it must be deferred until the end of the war. The question of equal wages for women arose in Schöneberg, where the rate of payment for the women street sweepers was lower than that formerly paid to the men. A Socialist alderman having objected to the action of the Schöneberg common council on the ground that women should have the same pay as men, the mayor contended that the salaries of women should remain unequal, because otherwise the increase would extend all along the line; men would demand more money and refuse to work for the same pay as women. During 1916 the policy of Maximilian Harden's journal, the *Zukunft*, in criticising the war and offering suggestion continued to be the subject of important remark. His articles were widely quoted in the press. In February, commenting on the prospects of peace, he declared that the conditions had changed within six months. At that date, said he, the Germans would have been contented with a defensive policy and with a retention of what they had won. Now, however, the danger of defensive policy was, he thought, evident, for it would give the enemy a chance to learn the secrets of German economic war policy in the first place, and in the second place, German supplies were likely to run out. Delay for Germany therefore was dangerous. What she demanded was a peace on an enduring basis—one that would not involve the loss of honor to her enemies or bar the way to gradual reconciliation. His journal again attracted much attention in the hostile press toward the close of the year by its contention that the promise to Poland (see above) was not binding and of no importance, as not bearing the Chancellor's signature.

For the discussion of the two points of view in regard to the Belgian deportations and the deportations in the north of France, see BELGIUM and FRANCE, paragraphs on *History*. See also CHEMISTRY, INDUSTRIAL; GERMAN PROTECTORATES; PRICES; SOCIALISM; TARIFF; UNITED STATES; WAR OF THE NATIONS, and articles on each of the belligerent Powers. See also GREECE.

**GERNSHEIM, FRIEDRICH.** A German composer, died in Berlin, Sept. 17, 1916. He was born in 1839 at Worms, studied at Mainz, Frankfurt, Leipzig, and Paris, and was a conductor successively at Saarbrücken, Cologne, and Rotterdam. Later he was conductor of an important singing society, the Stern Choral Society, of Berlin (1890-1904). During part of this time he also taught at Stern's Conservatory. Gernsheim is known for four symphonies, an overture, several concertos, choral works, and much chamber music.

**GEROULD, KATHERINE FULLERTON.** See LITERATURE, ENGLISH AND AMERICAN, *Travel*, American.

**GERRY, PETER GOELET.** Elected Democratic United States Senator from Rhode Island, Nov. 7, 1916.

**GIBRALTAR.** A narrow peninsula extend-

ing southward from the southwest coast of Spain; a British crown colony and naval and coaling station. Area, 1½ square miles; population, exclusive of the military, 18,448 in 1912. Practically a free port, it has no trade returns. Revenue (1914), £89,721; expenditure, £121,420; total tonnage entered and cleared, 12,213,230 (7,976,336 British). The customs revenue in 1914 was £32,564.

**GIBSON, WILFRID WILSON.** See LITERATURE, ENGLISH AND AMERICAN, *Poetry*, English.

**GIFTS AND BEQUESTS.** The following list of gifts and bequests made during 1916 is compiled from the table prepared annually by the *Chicago Daily Tribune*. The total amount of donations and bequests to charity, educational and religious institutions, art, music, and the public welfare in general in the United States during 1916 probably reached nearly \$1,000,000,000. Swelling this grand total were the large sums raised by Americans for relief to war sufferers. It is estimated that nearly \$45,000,000 was sent through the principal agencies in New York and Boston during the year, and in addition there were contributions sent through other agencies in various parts of the country, and numerous contributions which were made direct and not through any special fund. In addition to these donations supplies worth millions of dollars were collected. Of these war gifts Belgium received about \$11,000,000; France, nearly \$4,000,000; Germany, about \$9,000,000; Poland, \$2,300,000; England, \$1,125,000; Jewish relief, \$6,500,000; Serbia, \$320,000; Russia, \$160,000; Armenians and Syrians, \$2,665,000; Balkans, \$500,000, with smaller sums sent to other countries. These sums represent those sent by the Red Cross and larger relief organizations.

The increases by corporations to employees in wages and bonuses amounted to nearly \$400,000,000. Christmas charitable organizations and Good Fellows added about \$80,000,000 to the grand total.

The individuals giving the largest sums during the year were John D. Rockefeller, Andrew Carnegie, Julius Rosenwald, and Mrs. Russell Sage. Mr. Rockefeller's private donations amounted to \$9,500,000, Mr. Carnegie's to \$3,000,000, Mr. Rosenwald's to \$1,600,000, and Mrs. Russell Sage's to \$525,000.

The donations and bequests for various purposes amounted to \$764,077,779. These include only large sums which have been publicly announced. Of this total, donations amounted to \$623,262,002, and bequests to \$140,815,797. To charities were given \$657,042,700, to educational institutions, \$72,612,619; to religious institutions, \$20,243,735, to museums, art galleries, and municipal benefits, \$11,479,295, and to libraries, \$2,717,450.

Among the notable bequests and gifts made by women, were: Lizzie M. Palmer, Detroit, Mich., \$3,000,000; Lyra B. Nickerson, Providence, R. I., \$3,000,000; Mrs. D. W. James, New York City, \$2,550,000; Margaret H. W. Watson, Pittsburgh, Pa., \$2,500,000.

This list mentions only those gifts whose value was \$5000 or over. We are indebted for it to the courtesy of the *Chicago Tribune*.

Achells, Fritz, New York, gift to Red Cross base hospital, \$25,000.

Actors' Fund, gift by Moving Picture Industries, \$300,000; by various donors, \$9000.

**GILDER, JEANNETTE LEONARD.** An American editor and author, died in New York City, Jan. 17, 1916. Born at St. Thomas Hall, a school for girls at Flushing, L. I., conducted by her father, Miss Gilder entered newspaper work at 18 on the Newark *Morning Register*, became Newark reporter for the New York *Tribune*, and later was associated with her noted brother, Richard Watson Gilder, in editing *Scribner's Monthly*, which became the *Century*. With another brother, Joseph B. Gilder, she founded in 1881 the *Critic*, a literary journal, of which she was associate editor, until it became *Putnam's Magazine* in 1906. Previously, for five years, she had been connected with the New York *Herald*, as literary, musical, and dramatic critic, and for many years she was retained as correspondent by important papers in other cities. Latterly Miss Gilder had been editor and owner of the *Reader*, a guide to new books, and she had also placed manuscripts for authors, among whom she had a large acquaintance. Besides editing various books, she wrote *The Autobiography of a Tomboy* (1900) and *The Tomboy at Work* (1904).

**GINZBERG, ASHER.** See JEWS AND JUDAISM, *Literary Events*.

**GIORGI, ORESTES.** See ROMAN CATHOLIC CHURCH

**GLANDERS.** See VETERINARY MEDICINE.

**GLAZE.** See METEOROLOGY.

**GOLD.** With a gold production for the United States and colonies of \$92,315,363 in 1916 as compared with \$101,035,700 in 1915,

there was a corresponding decline in other countries so that the total production was expected to fall below the figure of \$473,134,590 for 1915, which, with a single exception, namely, 1912, recorded the high water point in the world's gold production. Australasia supplied less in 1916 than in the previous year and a provisional estimate of \$39,606,440 was made at the end of December. The same condition held true for the Transvaal, whose production was tentatively stated at \$186,854,445, while Japan, exclusive of Chosen, produced about \$2,911,392. Canada also showed a decreased production over 1915. While gold was greatly needed by the belligerent countries as shown by great activity on the Rand, yet the most important effects of the war were felt in the commercial movement of this precious metal. In the United States enormous gold reserves were accumulated so that on Nov. 1, 1916, the gold coin and bullion in the United States was \$2,700,136,976 or an increase of \$714,597,804 in 16 months. More gold was accumulated than ever before had been held by any other country in the world. In Sweden, Norway, and Holland the state banks were unable to coin all the gold offered and were permitted to accept bullion for deposit. In Australia the prohibition of the export of gold was removed in April, but the treasury retained supervision of all exports. In Great Britain the melting or use of current gold coin other than as currency was forbidden by an order in council of July 28th, and throughout the year gold was exported to the United States largely through Canada. From December, 1914, to December, 1916, the United States received net imports of gold equivalent to the production of the remainder of the world and in addition was able to retain all of its own domestic production. The vast amount of gold in the United States was looked upon as a possible source of commercial danger to American prosperity, for under the banking system recently established much less gold was required to insure a normal volume of credits than previously.

The gold production in 1915 exceeded all previous records. It amounted to 4,887,604 fine ounces, valued at \$101,035,700, compared with a value in 1914 of \$94,531,800. Two States, California and Colorado, produced over 1,000,000 fine ounces. California led by a slight margin. Alaska produced 808,345 fine ounces, valued at \$15,710,000. The value of the output of Nevada was \$11,883,700. The following table gives the production of gold in the States and Territories in 1915.

State or Territory	Fine ounces	Gold Value
South Dakota	858,145	7,403,500
Tennessee	329	6,800
Texas	87	1,800
Utah	189,045	3,907,900
Vermont	.....	.....
Virginia	24	500
Washington	22,830	461,600
Wyoming	672	13,900
Total	4,887,604	\$101,035,700

The production in 1916 exceeded the record production of 1915. See FINANCIAL REVIEW: METALLURGY.

**GOLD COAST.** A British crown colony and protectorate, with Ashanti and the Northern Territories, situated on the Gulf of Guinea, having the Ivory Coast (French) on the west, and Togoland (German) on the east. Area of the colony, 24,200 square miles; of Ashanti, 20,000; of the Northern Territories, 35,800—total, 80,000. The returns of the 1911 census place the population of the colony at 853,766; Ashanti, 287,814; Northern Territories, 361,806; but the figures are believed to understate the actual number of inhabitants. Accra, the capital, had (1911) 19,585 inhabitants; Coomassie, 18,853; Cape Coast Castle, 11,364; Secondee, 7725. The chief products and exports (1914) are cacao, £2,193,740; gold and gold dust, £1,687,645; rubber, £21,631; palm kernels, £88,671; palm oil, £37,646; lumber, £240,878; kola nuts, £142,190. Cotton goods, provisions, and wine and spirits are the main imports. Total trade (1914): £4,456,968 imports, £4,942,656 exports. Revenue, £1,331,713; expenditure, £1,755,850. Tonnage entered and cleared, 2,812,025. A railway runs from Secondee to Coomassie, 168 miles. A railway under construction from Accra to Akwapim, is open for traffic to a temporary terminus at Koforidua, about 51 miles distant. The northern extension from Koforidua has been begun, but work has been temporarily suspended.

**GOLF.** Charles E. Evans, Jr., of Edgewater, N. J., was the most conspicuous figure in the golfing world during the year 1916. He performed the extraordinary feat of capturing both the national amateur and the national open championships. Only once before in the history of the sport has an amateur accomplished this. Twenty-six years ago John Ball, of the Holyake Club, won both the amateur and open titles of Great Britain.

The women's national championship went to Miss Alexa Stirling, of Atlanta, Ga. She is only 17 years old. Mrs. Clarence H. Vanderbeck, holder of the title in 1915, did not defend her laurels, but Miss Stirling had the satisfaction of defeating the Philadelphia player in an invitation tournament at the Huntingdon Valley Club before the national championships were held.

The year was noteworthy for the fine showing made by young followers of the game. Aside from Miss Stirling, Robert Jones, 14 years old, also of Atlanta, Vincent Hilton, of the Metropolitan district, and Norman H. Maxwell, of Philadelphia, distinguished themselves. Jones succeeded in reaching the third round in the amateur tourney, only to be defeated by Robert A. Gardner, the 1915 amateur champion. Hilton won the metropolitan junior honors at Englewood, N. J., and Maxwell defeated, among others, Max R. Marston and Gardiner White,

State or Territory	Fine ounces	Gold Value
Alabama	247	\$5,100
Alaska	808,346	16,110,000
Arizona	220,392	4,555,900
California	1,090,781	22,547,400
Colorado	1,089,928	22,530,800
Georgia	1,684	34,800
Idaho	56,628	1,170,600
Illinois	.....	.....
Michigan	.....	.....
Montana	240,825	4,978,800
Missouri	.....	.....
Nevada	574,874	11,883,700
New Mexico	70,632	1,460,100
North Carolina	8,258	170,700
Oregon	90,321	1,867,100
Philippine Islands	63,895	1,320,900
Porto Rico	84	700
South Carolina	174	3,600

Another name deserving of special mention is James M. Barnes of the Whitemarsh Club, England, who, although unsuccessful in winning the national title, led a big field home in the first annual tournament of the Professional Golfers' Association of America.

The winners of the leading tournaments of the year were: United States Amateur, Charles E. Evans, Jr.; United States Open, Charles E. Evans, Jr.; United States Women, Miss Alexa Stirling; Metropolitan Amateur, Oswald Kirkby; Metropolitan Open, Walter C. Hagen; Metropolitan Women, Mrs. Q. F. Feitner; Metropolitan Junior, Vincent K. Hilton; Western Amateur, Heinrich Schmidt; Western Women, Mrs. F. C. Letts, Jr.; Western Junior, Jack Simpson; New Jersey, Oswald Kirkby; Southern Amateur, Reuben G. Bush; Southern Women, Miss Alexa Stirling; Southern Open, James M. Barnes; Women's Eastern, Mrs. W. A. Gavin.

Princeton won the intercollegiate team championship, defeating Harvard by 9 matches to 0. The individual title went to James W. Hubbell of Harvard, who defeated D. C. Corkran, of Princeton, 1 up on the 36th hole. The Western intercollegiate championship was won by the University of Illinois.

A résumé of the year would be incomplete if it did not make reference to the marvelous growth in popularity of the game of golf. New courses and clubs came into existence in all parts of the United States and in the larger cities new public links were made necessary to meet the extraordinary demand for such facilities.

**GOLTZ, KOLMAR, BARON VON DER.** A German soldier, died April 19, 1916, at the headquarters of the First Turkish army. It was officially announced that his death was caused by spotted fever, but a report was current that he had been killed by Turks disaffected at German dictation in Turkey. Born in 1843, at Bielkenfeld, East Prussia, and educated for a military career, he served in the Austro-Prussian and Franco-Prussian wars. In the latter, as commander of the Second army, he took part in several important battles. But he became best known for his work in Turkey, where he spent the years 1883-96 in reorganizing the Ottoman army, and whither he was called in 1908 to continue this work. By 1911 he had risen to the rank of general and field marshal in the German army, and he saw service in various important posts. After the German forces had entered Belgium in 1914, von der Goltz was placed in charge as military governor of Brussels. In November of the same year he was sent to Turkey as commandant at Constantinople, and he was largely responsible for the Turkish defense of the Gallipoli peninsula. As chief of the First Turkish army, after April, 1915, he had been engaged in operations in Asiatic Turkey. He was famous as a strategist and had written several books on military subjects, the most notable of which was *The Nation in Arms* (1883).

**GOMME, SIR (GEORGE) LAURENCE.** An English public official and antiquary, whose death at Long Crendon, Buckinghamshire, was announced Feb. 25, 1916. He was born at Hammersmith (London) in 1853, and all his life till his retirement in 1914 was identified with the life of the British capital. After studying at the City of London School, he entered the

Metropolitan Board of Works, and in 1891 was appointed statistical officer to the London County Council. From 1900 to 1914 he was clerk of the council. In 1911 he was knighted. Sir Laurence Gomme was largely instrumental in efforts to preserve the features of Old London, and he had gone deeply into the historical and antiquarian lore of the city. Deeply interested also in the wider field of folklore, he had founded the Folklore Society, become a fellow of the Anthropological Society, and edited the *Folklore Journal*, besides the *Antiquary* and the *Archaeological Review*. His writings include: *Primitive Folk-Moots* (1880); *Ethnology in Folklore* (1892); *The Making of London* (1911); *London* (1914).

**GONCOURT PRIZE.** See FRENCH LITERATURE.

**GONZALEZ BESADA, AUGUSTO.** See SPANISH LITERATURE.

**GOODRICH, JAMES P.** Elected Republican Governor of Indiana, Nov. 7, 1916.

**GÖRGEY, ARTHUR.** An Hungarian soldier, died at Budapest, May 21, 1916, at the age of 98. He was born in 1818 of a noble family of Saxony. At the outbreak of the Hungarian War of Liberation in 1848 he was commissioned a captain in the revolutionary army, and after winning a number of victories over the Austrians was made commander-in-chief. Kossuth resigned as dictator Aug. 11, 1849, after Russia had come to the support of Austria, and Görgey succeeded him. Two days later, however, Görgey was forced to surrender to the Russians. He was confined at Klagenfurt, Austria, but was released. The Hungarians were bitter against him for his surrender, but he took this action to save his men from being overwhelmed by five armies. As a sort of *apologia* he published a book translated into English as *My Life and Acts in Hungary, 1848-49* (1852). Görgey afterward became known as a chemist and railway engineer, but for many years had retired from public life.

**GOBIZIA.** See WAR OF THE NATIONS.

**GORST, SIR JOHN ELDON.** A British politician, died in London April 4, 1916. He was born at Preston in 1835, graduated from St. John's College, Cambridge, in 1857, and after several years as an inspector of schools at Wai-kato, New Zealand, returned and was called to the bar in 1865. During several periods he was a member of Parliament, in 1866-68 for Cambridge, in 1875-92 for Chatham, and again in 1892-1906 for Cambridge. He also held various offices, solicitor general, under secretary for India, and financial secretary to the Treasury—all as a Conservative. Gorst, who had been knighted in 1885, had become known for an independence in politics which led him often to oppose his own party, and which made him a prominent member of the noted Fourth Party of the early eighties. On his failure to be returned to Parliament in 1906, he came out as a Liberal, after 50 years of connection with the Conservatives, and devoted himself to problems of social reform. In 1909 he stood for Preston, but was defeated. He published in 1907 *The Children of the Nation* (he had been prominent in educational matters) and in 1908 *New Zealand Revisited*.

**GORZ AND GRADISCA.** A crownland of Austria. Area, 1127 square miles; population, 1910, 260,721.

**GOTTI, GIROLAMO MARIA.** An Italian cardinal and prefect of the Propaganda, died in Rome March 19, 1916. He was born in Genoa in 1834. Although the son of a dock laborer, he was enabled to study for the Church, and for 20 years was a Carmelite monk, living a most austere life. His scholarship and teachings eventually brought him to the attention of Pope Leo XIII, who gave him a post at the Vatican, and who later sent him to Brazil to bring the prelates there into harmony with the new republican government. He had been archbishop for some years, when in 1895 he was created cardinal. On the death of Cardinal Ledochowski in 1902, Cardinal Gotti succeeded him as prefect of the Propaganda, and Pope Leo is supposed to have desired him as his successor on the papal throne.

**GOUCHER COLLEGE.** A non-sectarian institution for the education of women, at Baltimore, Md. It was founded in 1885. In the fall of 1916 there were 616 students and 43 members in the faculty. Benefactions amounting to about \$160,000 were received during 1916. The college possesses in productive funds \$1,000,000, and during the year drew a net income from all sources of \$123,635. The library contains 25,000 volumes. President, William W. Guth.

**GOVERNMENT.** See section so entitled under various countries.

**GOWER, LORD RONALD SUTHERLAND.** An English sculptor and writer on art and other subjects, died March 9, 1916, at Tunbridge Wells. A younger son of the second Duke and twentieth Earl of Sutherland, and of his wife, who was famous in her day as a friend of Queen Victoria and as a political influence, Lord Ronald was born at Stafford House in 1845. After an education at Eton and at Trinity College, Cambridge, from which he did not graduate, he sat in Parliament as Liberal member for Sutherlandshire from 1867 to 1874, but had no liking for political life. When free, he gave himself to travel and to the study of art history and the practice of sculpture. In the latter field he is best known for his Shakespeare monument at Stratford. As an art critic, he wrote a guide to the pictures of Holland and numerous books on the painters of the English school. He also published historical works such as *Life of Joan of Arc*, *Last Days of Marie Antoinette*, and *History of the Tower*; but the volumes in which he discussed agreeably the famous people whom he had known (his family were connected with most of the important titled families of England) were most popular. These include *Old Diaries* (1902) and *Records and Reminiscences* (1903). His last book was *Stafford House* (1910).

**GOYESCAS.** See MUSIC, *Opera*.

**GRADE CROSSING PROTECTION.** See RAILWAY ACCIDENTS.

**GRAHAM, HOBACE F.** Elected Republican Governor of Vermont, Nov. 7, 1916.

**GRAIN STANDARDS ACT.** See AGRICULTURE.

**GRANADOS, ENRIQUE.** A Spanish pianist and composer, died in escaping from the *Sussex*, a vessel which, while crossing the English Channel, was torpedoed by a German submarine March 24, 1916. Señor Granados was on his way back to Spain with his wife (who was also lost), after a visit to the United States, during which he attended the world première

of his opera *Goyescas*, which was produced by the Metropolitan Opera Company on the preceding January 28th. He was born at Lerida, Catalonia, in 1867, studied music in Spain under Bautista Pujol and Felipe Pedrill, and at 20 went to Paris, where Charles de Bériot was his teacher in pianoforte. His first opera, *Maria del Carmen*, was presented at the Royal Theatre, Madrid, in 1898, part of *Foletto*, a second opera, was given at Barcelona in 1903, and, also in the latter city, *Liliana* was produced in 1911. Before this date he had also composed other works for orchestra, instrumental trios and quartets, songs, and pianoforte solos. The opera *Goyescas*, based on a number of pianoforte solos, was to have been presented at the Grand Opéra in Paris, when the war interfered. The first opera ever sung in Spanish in New York, it pleased both many critics and the public by its novelty, distinctly national quality, and melodiousness. As a pianist, Señor Granados appeared in recital several times in New York, and also in Washington at the White House. See MUSIC, sections *Artists*, *Instrumentalists*, *Chamber Music*, and *Opera*.

**GRANDFATHER CLAUSE.** See ELECTORAL REFORM.

**GRAND OPÉRA.** See MUSIC, *France*.

**GRAND PRIX DE LITTÉRATURE.** See FRENCH LITERATURE.

**GRAPHITE.** The greater part of the graphite used in the United States is imported. Approximately 19 per cent was produced from domestic sources in 1915. In addition to natural graphite the United States produced a considerable quantity of manufactured graphite in the electric furnaces of Niagara Falls. The imports came chiefly from the island of Ceylon. The greater part of crystalline graphite is produced in New York, Pennsylvania, and Alabama. A small quantity is also produced in Montana. As a result of the increased production in all these States the quantity of crystalline graphite produced in 1915 exceeded that of any previous year. The total amount produced in 1915 was 4718 short tons, valued at \$429,639, compared with 4336 tons, valued at \$324,118 in 1914. The imports of graphite in the United States in 1915 amounted to 23,075 short tons, valued at \$2,241,163. At noted above, the largest amount comes from Ceylon, but considerable quantities are also imported from Canada, Japan, and Mexico.

**GREAT BRITAIN.** THE UNITED KINGDOM OF GREAT BRITAIN AND IRELAND. A constitutional monarchy. The capital is London, in England, on the river Thames. The term "Great Britain" is often used to mean "United Kingdom"; properly Great Britain is the large island consisting of England, Wales, and Scotland. Also "England," especially when referring to the government, is sometimes used to mean "United Kingdom." England and Wales in many respects are regarded as a single division of the United Kingdom. The United Kingdom and its possessions, that is, all territories subject to the ultimate control of the Parliament at London, constitute the British Empire. Attached to the United Kingdom, but regarded neither as parts of it nor yet as colonies, are the Isle of Man and the Channel Islands.

**AREA AND POPULATION.** The area of the United Kingdom, including inland water, is

stated at 121,331 square miles; with the Isle of Man and the Channel Islands, 121,633 square miles. The latter area is about 58.2 per cent of the area of Germany, or somewhat less than the combined areas of New England, New York, and New Jersey (123,852 square miles). England and Wales comprise 58,340 square miles (land, 58,029); Scotland, 30,405 square miles (land, 29,796). Slightly differing figures for area are issued, in statute acres, each year by the Board of Agriculture and Fisheries; for such figures, published in 1915, see section *Agriculture* below. The following table shows by divisions the area, in square miles, the population present according to the census of April 3, 1911, the density per square mile in 1911, and the population as estimated June 30, 1914 (the 1914 figure for England and Wales is a reestimate):

	1911			
	Sq. m.	Pop.	Dens.	Pop. 1914
England * . . . . .	50,874	84,045,290	669	86,966,684
Wales . . . . .	7,466	2,025,202	271	
Scotland . . . . .	30,405	4,760,904	156	4,747,167
Ireland . . . . .	32,586	4,890,219	135	4,881,898
U. Kingdom . . . . .	121,331	45,221,615	373	46,089,249
Isle of Man . . . . .	227	52,016	229	
Channel Islands . . . . .	75	96,889	1,292	
Total . . . . .	121,633	45,370,580	374	

\* Including Monmouthshire.

The population figures represent persons present and therefore do not include British soldiers, sailors, and merchant seamen abroad. The estimated population of the United Kingdom on June 30, 1914 (46,089,249) was about 68 per cent of the estimated population of Germany on the same date (67,810,000).

According to census returns, the population of England, Wales, and Scotland has steadily increased; the rural population of Scotland, however, is practically stationary. In Ireland, the census of 1841 showed the maximum population. Various census returns for England and Wales, Scotland, Ireland, and the United Kingdom:

	E. & W.	Scot.	Ire.	U. K.
1841 . . . . .	15,914,148	2,620,184	8,196,594	26,730,929
1861 . . . . .	20,066,224	3,062,294	5,798,967	28,927,485
1881 . . . . .	25,974,439	3,735,578	5,174,896	34,884,848
1901 . . . . .	32,527,848	4,472,108	4,458,775	41,458,721
1911 . . . . .	36,070,492	4,760,904	4,890,219	45,221,615

England's percentage of the population of the United Kingdom increased from about 58.1 in 1841 to 75.3 in 1911; that of Wales, from 3.4 to 4.5; Scotland, 9.8 to 10.5; while Ireland's percentage decreased from 30.7 to 9.7. In England the percentage of increase in 1891-1901 was about 12.1 and in 1901-11 about 10.5; in Wales, 13.3 and 18.1; in Scotland, 11.1 and 6.5; in Ireland, decrease 5.2 and 1.5; United Kingdom, increase 9.9 and 9.1.

Number of males and females respectively in 1911: England, 16,421,298 and 17,623,992 (1073 females to 1000 males); Wales, 1,024,310 and 1,000,892 (977); Scotland, 2,308,839 and 2,452,065 (1062); Ireland, 2,192,048 and 2,198,171 (1003); United Kingdom, 21,946,495 and 23,275,120 (1061).

Returns of the 1911 census in respect of occupations are shown in the tables below. For

England, Wales, and Scotland, the occupational statistics exclude persons under 10 years of age, while for Ireland they include the total population.

England & Wales	Males	Females	Total
Government . . . . .	248,624	50,975	299,599
Defense . . . . .	205,817		205,817
Professional . . . . .	367,578	847,043	714,621

Total . . . . .	2,192,048	2,198,171	4,390,219

In England and Wales, in 1911, the population of urban districts was 28,162,936 and of rural districts 7,907,556. The percentage in urban districts in 1911 was 78.1, as compared with 77.0 in 1901, 72.0 in 1891, 67.9 in 1881, and about 50.2 in 1851. England and Wales in 1911 had 97 urban districts (including the administrative county of London as one district) with a population exceeding 50,000 each. The population of these districts totaled 17,251,009, the increase per cent in 1901-11 having been 8.3, as compared with 15.3 in 1891-1901. London, that is, the administrative county, had in 1911 4,521,685 inhabitants; it covers an area of 117 square miles, and its population showed a decrease of 0.3 per cent since 1901. Greater London includes the administrative county and a wide belt of suburban towns and districts known as the "outer ring." The area of the outer ring is 576 square miles; its population in 1911, 2,720,673. Greater London thus has an area of 693 square miles, with a population of 7,251,358 in 1911, the increase per cent in 1901-11 having been 10.2, as compared with 16.8 in 1891-1901. In 1911, the population of the larger cities of England and Wales, after London, with increase per cent over 1901, was as follows: Birmingham, 525,833 (0.5)—with districts annexed Nov. 9, 1911, 840,202; Liverpool, 746,421 (6.0); Manchester, 714,333 (10.8); Sheffield, 454,632 (11.1)—with districts annexed April 1, 1912, 459,916; Leeds, 445,550 (3.9); Bristol, 357,048 (5.3); West Ham (in outer ring), 289,030 (8.1); Bradford, 288,468 (3.1); Kingston-upon-Hull, 277,991 (15.7); Newcastle-upon-Tyne, 266,603 (7.9); Nottingham, 259,904 (8.4); Stoke-on-Trent, 234,534 (9.2); Salford, 231,357 (4.7); Portsmouth, 231,141 (22.3); Leicester, 227,222 (7.4); Cardiff (in Wales), 182,259 (10.9); Bolton,

180,851 (7.5); Croydon (in outer ring), 169,551 (26.6); Willesden (in outer ring), 154,214; Rhondda (in Wales), 152,781; Sunderland, 151,159; Oldham, 147,483.

In Scotland, the larger municipal burghs, with population in 1911 and increase per cent over 1901, are: Glasgow, 784,455 (1.1); Edinburgh, 320,315 (0.9); Dundee, 165,006 (1.2)—with Broughty Ferry, annexed in 1913, 176,062; Aberdeen, 163,331 (6.2); Govan, 89,725 (9.2); Paisley, 84,447 (6.4); Leith, 80,489 (3.9).

In Ireland, the population of Dublin in 1911 was 304,802—with suburbs, 403,030 (increase since 1901, 7.4 per cent); Belfast, 386,947; Cork, 76,673; Londonderry, 40,780; Limerick, 38,518.

The number of births, deaths, and marriages (that is, persons married) in 1913 and 1914:

		<i>Births</i>	<i>Deaths</i>	<i>Marriages</i>
England and Wales	1913	881,800	504,975	286,583
	1914	878,822	516,778	294,087
Scotland	1913	120,516	73,069	33,691
	1914	128,928	73,548	35,051
Ireland	1913	100,094	74,694	22,266
	1914	98,806	71,345	23,695
Total for United K.	1913	1,102,500	652,788	342,540
	1914	1,101,551	661,671	352,833

The total excess of births over deaths in 1913 449,762 and in 1914 439,880. It is interesting to note that in Germany the excess of births over deaths in 1913 was 833,800; the German birth rate in that year was 29.1, and the British, 24.1; the German death rate 15.8, and the British, 14.3. The rate, per thousand inhabitants, of births, of deaths, and of marriages (that is, persons married) is shown in the following table:

		<i>E. &amp; W.</i>	<i>Scot.</i>	<i>Ire.</i>	<i>U. K.</i>
Birth rate	1904	28.0	29.1	23.6	27.7
	1909	25.8	27.3	23.4	25.7
	1912	23.9	25.9	23.0	24.1
	1913	24.1	25.5	22.8	24.1
	1914	23.8	26.1	22.6	23.9
Death rate	1904	16.3	17.1	18.0	16.6
	1909	14.6	15.9	17.1	15.0
	1912	13.3	15.3	16.5	13.9
	1913	13.8	15.5	17.1	14.3
	1914	14.0	15.5	16.3	14.4
Marriage rate	1904	15.3	14.1	10.4	14.7
	1909	14.7	12.8	10.3	14.1
	1912	15.6	13.7	10.6	14.9
	1913	15.7	14.3	10.2	15.0
	1914	15.9	14.8	10.8	15.3

Number of passengers that arrived in or left the United Kingdom from or for countries out of Europe, distinguishing British and aliens (the last column shows the number of British passengers from and to the United States):

		<i>British</i>	<i>Aliens</i>	<i>Total</i>	<i>U. S.</i>
Arrivals	1904	144,581	92,172	*241,896	79,655
	1909	149,068	112,257	261,325	53,323
	1912	199,181	141,515	340,696	71,493
	1913	227,643	144,975	372,618	77,014
	1914	229,870	130,022	359,892	77,171
Departures	1904	271,485	174,354	*453,877	146,445
	1909	288,761	185,617	474,378	109,700
	1912	467,666	189,169	656,835	117,310
	1913	469,640	232,051	701,691	129,169
	1914	293,204	158,234	451,438	92,808

\* In 1904, 5143 arrivals and 8088 departures were not distinguished as either British or aliens.

Total arrivals in 1915 are reported at 147,354; departures, 126,505.

**PUBLIC EDUCATION.** The educational system is partly under state and local control and partly private. Elementary instruction is compulsory between the ages of 5 and 14 (but in many cases partial or total exemption is possible); it is provided free by the local authorities, aided by state grants. Secondary education is still largely of a private character, but considerable progress has been made in the organization of a public secondary-school system. The schools here treated are not to be confounded with the many private, and often expensive, institutions known as "the public schools."

In England and Wales, on July 31, 1914, accommodations in the ordinary public elementary schools numbered 7,004,007; pupils on the registers, 6,078,823 (of whom 4,982,342 under 12 years of age); percentage of average attendance to average number on registers, 88.73. Public secondary schools numbered 1027, with 187,207 full-time students. Figures for evening and similar schools are not available for 1914, but for the year ended July 31, 1913, there were 6876 such schools, with 798,881 students.

In Scotland, for the year ended Aug. 31, 1914, there were 3171 day primary schools in receipt of grants, accommodations for 1,058,809 pupils, 814,345 enrolled, and 728,270 in average attendance. Higher grade schools in receipt of grants numbered 195, with 41,029 accommodations, 26,655 pupils enrolled, and 25,913 in average attendance. Students in continuation classes, 151,855. Secondary schools claiming grant, 56, with 19,780 students enrolled and average attendance of 18,742.

In Ireland, primary schools in 1914 numbered 8207; accommodations, 777,046; pupils enrolled, 679,762; average attendance, 508,424.

**AGRICULTURE.** In 1916, crops in England and Wales were generally harvested late and were secured only in fair condition. Labor was very deficient, especially horsemen and men for thrashing. Women were largely employed at high wages for digging potatoes. Unfavorable weather and scarcity of labor for fall plowing and sowing indicated a decrease in the wheat area for 1917. The preliminary estimate of the 1916 wheat production in England and Wales was 55,540,472 bushels, about 12,000,000 bushels less than in 1915, but more than in 1912 or 1913; the yield per acre, 29 bushels, was about two bushels below that of 1915, and about 2.8 bushels below the average for 1906-15. The barley crop, estimated at 41,720,592 bushels, was nearly 5,600,000 bushels in excess of 1915. Oats were slightly better than in 1915, yielding 83,689,312 bushels, the largest production since 1910. The estimated yield of beans was 6,900,976 bushels, and of peas 2,081,032 bushels.

Each year the area of the United Kingdom is stated in statute acres by the Board of Agriculture. The figures vary slightly from year to year; the latest available place the total area (including the Isle of Man and the Channel Islands) at 77,720,341 acres, including rivers and lakes, but not including foreshore and tidal waters. The area of Great Britain (England, Wales, and Scotland) is stated at 56,800,463 acres; Ireland, 20,734,124; Isle of Man and the Channel Islands, 185,764. The cultivated area as reported for the first week of June, 1914, was 46,763,816 acres, as compared with 46,740,904 acres in 1913 and 47,670,997 in 1904; the culti-

vated area in 1914 was distributed as follows: Great Britain, 31,900,185 acres; Ireland, 14,742,766; Isle of Man and the Channel Islands, 120,865.

The table below shows the total acreage under principal crops in 1914 and the production in 1913 and 1914 (the figures for acreage include, while those for production exclude, the comparatively small returns of the Isle of Man and the Channel Islands):

	Acreage		Production	
	1914	1913	1913	1914
<b>Corn Crops:</b>				
Wheat	1,905,938	56,696,400	62,432,325	
Barley	1,873,280	65,682,531	64,525,424	
Oats	3,899,074	165,282,285	165,308,299	
Eye	66,890			
Beans	301,488	7,602,475	8,960,627	
Peas	169,938	3,385,877	2,992,303	
Total	8,216,603

Permanent pasture:				
For hay	6,496,527	10,164,048	8,192,555	
Not for hay	20,853,123			
Hops	36,661	255,841	507,258	

\* Exclusive of heath or mountain land. † Cwt.

The following figures for live stock relate to England and Wales, June, 1915 and 1916 respectively: horses used for agricultural purposes, including mares for breeding, 729,080 and 772,770 (increase 6 per cent); unbroken horses, including stallions, one year and above, 209,770 and 227,170 (increase 8.3 per cent); same under one year, 99,240 and 109,810 (increase 10.7 per cent); other horses, 249,090 and 249,820 (increase 0.3 per cent); total horses, 1,287,180 and 1,359,570 (increase 5.6 per cent); cows and heifers in milk, 1,881,670 and 1,855,450 (decrease 1.4 per cent); total cattle, 6,064,150 and 6,215,780 (increase 2.5 per cent); sheep under one year, 7,169,190 and 7,307,050 (increase 1.9 per cent); total sheep, 17,522,580 and 17,951,120 (increase 2.4 per cent); swine, 2,420,030 and 2,167,940 (decrease 10 per cent).

The table below shows for Great Britain, for Ireland, and for the United Kingdom (including the Isle of Man and the Channel Islands) the number of live stock in the first week of June; the figures for horses include only those used for agriculture, unbroken horses, and brood mares:

	Horses	Cattle	Sheep	Swine
<b>Gt. Britain:</b>				
1913...	1,324,404	6,963,854	28,931,412	2,233,855
1914...	1,296,188	7,092,918	24,285,514	2,634,249
<b>Ireland:</b>				
1913...	541,341	4,982,625	8,620,724	1,060,360
1914...	546,369	5,051,645	3,600,581	1,305,688
<b>U Kingdom:</b>				
1913...	1,874,264	11,936,600	27,629,206	3,305,771
1914...	1,851,042	12,164,505	27,963,977	3,952,615

See AGRICULTURE; AGRICULTURAL EDUCATION; DAIRYING.

**MINING AND METALS.** By far the most important mineral mined is coal, and the most important metal is iron. Coal production in 1914 was 265,664,393 tons, spot value £132,596,853, as compared with 287,430,473 tons, £145,535,669, in 1913; iron ore in 1914, 14,867,582 tons, £3,921,683, as compared with 15,997,328 tons, £4,543,558, in 1913. The output of pig iron in 1914 was 8,923,773 tons, as compared with 10,260,315 tons in 1913. Of the latter amount, 5,138,058 tons were from British ores and 5,121,357 from foreign ores. Metals were produced from British ores as follows in 1913: fine copper, 421 tons; lead, 18,130 tons; white tin, 5288; zinc, 5823; silver, 138,046 ounces; gold, 153 ounces.

**FISHERIES.** Wet fish (exclusive of salmon and shell fish) landed on the coasts of the United Kingdom in 1913 amounted to 24,657,116 cwts., valued at £14,229,311; in 1914, 18,155,126 cwts., £11,228,829. The value of shell fish landed in 1913 was £463,642, and in 1914 £401,812. The cod catch in 1913 and 1914 respectively was valued at £2,300,119 and £2,321,617; herring, £4,572,295 and £2,115,899; haddock, £1,891,005 and £1,645,759; whiting, £390,980 and £397,462; sole, £474,127 and £395,386.

**COMMERCE.** Since the outbreak of the great war in August, 1914, certain goods belonging to the British and allied governments have been excluded from the returns of trade. The figures for 1915 here given are subject to revision. Total imports, imports reexported, and net imports (that is, imports for home consumption) have been valued as follows (exclusive of specie and bullion of foreign merchandise trans-shipped under bond, and of diamonds from the Union of South Africa):

	Total imports	Reexports	Net imports
1910	£875,257,024	£103,761,045	£574,495,979
1911	680,157,527	102,759,134	577,398,393
1912	744,640,681	111,737,691	632,902,940
1913	768,734,739	109,575,037	659,159,702
1914	696,635,113	95,474,166	601,160,947
1915	853,756,279	98,797,123	754,959,156

Total exports, reexports of foreign and colonial produce, and domestic exports (that is, exports of British produce) have been valued as follows (exclusive of specie and bullion and of foreign merchandise trans-shipped under bond):

	Total exports	Reexports	Dom. exp.
1910	£534,145,817	£103,761,045	£430,384,772
1911	556,878,432	102,759,134	454,119,298
1912	598,961,130	111,737,691	487,223,439
1913	634,820,326	109,575,037	525,245,289
1914	526,195,523	95,474,166	430,721,357
1915	483,444,459	98,797,123	384,647,336

In 1914 and 1915 respectively, imports of gold and silver specie and bullion amounted to £70,595,001 and £21,328,527; exports, £41,488,125 and £45,978,689.

Total imports of merchandise, domestic exports of merchandise, and reexports of foreign and colonial merchandise in 1914 and 1915 are shown by classes in the following table, in thousands of pounds sterling (figures for 1915 subject to revision):

	Total Imports		Dom. Exports		Re-exports

\* Other than machinery and un-insulated wire. † Including parcel post goods not liable to duty.

Some of the more important articles of import not shown separately in the table were valued as follows in 1914 and 1915 respectively, in thousands of pounds sterling: wheat, 44,734 and 57,313; sugar (refined and unrefined), 32,118 and 31,833; beef, 23,366 and 30,367; butter, 24,014 and 27,036; bacon, 18,226 and 25,441; rubber, 15,844 and 20,322; tea, 14,221 and 19,751; maize, 11,761 and 18,897; fruits, 15,063 and 17,100; mutton, 11,594 and 14,130. For 1914 the domestic export of cotton piece goods is reported at 79,175 thousand pounds sterling, and for 1915 at 64,703; cotton yarn, 11,973 and 10,313; woolen tissues, 11,574 and 16,491; worsted tissues, 6204 and 6100; woolen and worsted yarn, 3793 and 2605; linen piece goods, 5480 and 4937; tinned plates and sheets, 5999 and 5688; galvanized sheets, 7227 and 4632; pig iron, 2924 and 3476; manures, 4886 and 4812; fish, 3758 and 1470.

The accompanying table shows the total imports of merchandise consigned from and the total exports of merchandise consigned to the principal countries, in thousands of pounds sterling:

	Imports		Exports	
	1914	1915	1914	1915
United States .....	138,575	238,006	64,039	55,545

Other	209	96	218	135
Total	82,149	71,126	82,661	68,963

At the end of 1913 and 1914 respectively, the number of vessels, with gross tonnage comprising the British merchant marine was as follows: sail, 8336 vessels, of 921,861 tons, and 8203 vessels, of 864,679 tons; steam, 12,602 vessels, of 18,683,039 tons, and 12,862 vessels, of 19,145,140 tons; total, 20,938 vessels, of 19,604,900 tons, and 21,065 vessels, of 20,009,819 tons. The total net tonnage is stated at 12,119,891 at the end of 1913 and 12,415,204 at the end of 1914. The net tonnage of steam vessels was increased in 1914, owing to the coming into full force, on January 1, 1914, of the provisions of the Merchant Shipping Act, 1907.

Number and net tonnage of vessels (other than war vessels) built in the United Kingdom in 1913 and 1914 respectively: sail, 338 vessels, of 30,382 tons, and 281, of 29,107 tons; steam, 909 vessels, of 1,170,107 tons, and 858, of 1,006,065 tons; total, 1247 vessels, of 1,200,489 tons, and 1139 vessels, of 1,035,172 tons. In 1913, 202 vessels, of 225,315 tons net, were built for foreign owners; in 1914, 129 vessels, of 196,564 tons. Vessels on the British register sold to foreign countries in 1913, numbered 433, of 488,240 tons net; in 1914, 327, of 398,929 tons net. These figures do not include war vessels.

COMMUNICATIONS. On Dec. 31, 1913, and Dec. 31, 1914, respectively, the length of railway line open to traffic in England and Wales was 16,401 and 16,414 miles; in Scotland, 3880 and 3876; in Ireland, 3410 and 3411; total for United Kingdom, 23,091 and 23,701. The total, reduced to single track, including sidings, was

55,405 miles at the end of 1913 and 55,663 miles at the end of 1914. On account of the war, later figures are not available. In consequence of special arrangements made in connection with the war, the financial returns for 1914 are incomplete; but, as reported for the end of that year, the total paid-up capital was £1,341,222,000, as compared with £1,334,011,000 in 1913. The average rate of dividend or interest was 3.52 per cent in 1914 and 3.62 in 1913; on account of nominal additions made to the capital, these rates are lower than they otherwise would be. For 1913 and 1914 respectively: gross receipts, £139,451,429 and £139,098,365; working expenses, £87,320,550 and £88,173,232; net receipts, £52,130,879 and £50,925,133; proportion of working expenses to gross receipts, 63 and 63.

The length of tramway and light railway line at the end of 1914 was 2703 miles; in 1913, 2662. Paid-up capital, £78,858,930; gross receipts, £15,787,877; working expenses, £10,150,556; net receipts, £5,628,321.

On March 31, 1913, and March 31, 1914, respectively, the length of telegraph and telephone lines was 75,042 and 81,000 miles; wire, 2,661,378 and 2,886,025 miles; offices, 14,129 and 14,237; instruments in use, 759,059 and 805,604 (of which, telephones 730,763 and 774,821). Post-offices in 1914, 24,447; in 1915, 24,509.

Under the government control of railways in the United Kingdom as practiced in 1915 and 1916 there was but little statistical or other information save such as was announced at the annual meetings of stockholders. In 1916 there was vastly more traffic than in 1915, and as regards freight there was available for comparison some figures of the earlier year. In commercial merchandise alone, and excluding all naval and military business the Great Central recorded an increase in value of traffic in 1915 of £81,000 over 1914. The Midland carried in 1915 3,749,844 tons of collected and delivered traffic as against 3,467,491 tons in 1914, and to London and beyond 5,667,443 tons of coal or an increase of 846,319 over the previous year. The London and Northwestern carried in 1915 the greatest volume of freight in its history, which was more than one million tons over 1913. The Great Western reported an abnormally large traffic, the Lancashire and Yorkshire record business, and the Furness line one of its best years, while the South-Eastern and Chatham, usually considered a passenger line, reported heavy freight traffic.

In 1915 the 44 principal railways contemplated in 1916 capital expenditures aggregating £4,437,607, the greater part of which was to go for electrification and rolling stock, the latter taking £960,207. Little new work was done on railway, bridges, or widening, etc. The new bridge across the Trent with a Scherzer bascule lifting span of 160 feet and weighing about 3000 tons, being the heaviest rolling lift span in Europe, was perhaps the most notable engineering work of the year. Only two new railways were under construction during the year. One, the Mansfield Railway Company, connected the Great Central main line at Kirkby, 12 miles north of Nottingham, with the Chesterfield and Lincoln branch, a distance of 11 miles, and was equipped for passenger as well as freight traffic. The other new enterprise was the Gowdall and Braithwell railway, from Gowdall on the Hull

and Barnsley main line to Braithwell, where it connects with the Midland and Great Central companies. This was built jointly by the Hull and Barnsley and the Great Central companies. Its southern terminal is at Dinnington colliery and the length of main line is 21 miles, or, with its various branches, over 25 miles. It was open for freight and coal and ore on May 1st, but the completion of the stations for passenger traffic was postponed until after the war. The progress of electrification (see ELECTRIC RAILWAYS) was slow, on account of the war, but wherever the lines were in operation wonderful service was being afforded, satisfactory both from a financial and technical standpoint. On the London, Brighton, and South Coast the equipment of two sections was proceeding slowly, while the London and Southwestern completed, during the year, the electrification of the suburban lines for which plans had been made, the last section being that between Elephant and Castle and Watford. The Lancashire and Yorkshire began electrical service early in the year between Manchester and Bury.

An important step taken during the year was the pooling of freight cars. This had been done by the Great Northern, Great Eastern, and Great Central companies, and on April 2nd the example was followed by the London and Northwestern, Great Western, Midland, North-Eastern, and Lancashire and Yorkshire, which adopted the principle of common use for all their open freight cars. The Scotch railways also formed a similar pool and on December 26th it was announced that with the new year all cars belonging to lines under government control would be used in common. Many economies were practiced during the year. Unnecessary and duplicating stations were closed, and dining cars were withdrawn on the London and Northwestern and Great Northern. On September 13th, the war bonus of the railway men was doubled, amounting to 10 shillings, the additional cost being assumed by the government. Late in the year (December 14th) an order in council was made in regard to railway traffic, giving to the Board of Trade very extreme powers. In Ireland a threatened strike of the enginemen on the Great Southern and Western Railway of Ireland was prevented on December 16th by the government taking control of all the Irish railways. In this way the regular war bonus could be paid to the employees by the government as in Great Britain, instead of coming as previously in the form of a few shillings from the stockholders.

**FINANCE.** The monetary unit is the pound sterling; its par value is \$4.86656. In years ended March 31st, revenue (actual receipts into the exchequer) and expenditure (chargeable against revenue) have been as follows, in thousands of pounds sterling:

	1905	1910	1913	1914	1915
Revenue ..	153,183	181,896	188,802	198,243	228,694
Expenditure	151,769	157,945	188,622	197,493	560,474

As officially stated for the fiscal years 1914 and 1915, receipts into the exchequer, under the principal heads thereof, are shown in the table below:

Revenue	1913-14	1914-15
Customs .....	£ 35,450,000	£ 38,862,000
Excise .....	89,590,000	42,313,000

Revenue	1913-14	1914-15
Estate, etc., duties .....	£ 27,859,000	£ 28,382,000
Stamps * .....	9,968,000	7,577,000
Land tax .....	700,000	680,000
House duty .....	2,000,000	1,980,000
Property and income tax ..	47,249,000	69,899,000
Land value duties .....	715,000	412,000
<b>Tax revenue .....</b>	<b>£163,029,000</b>	<b>£189,805,000</b>
Postal service .....	£ 21,190,000	£ 20,400,000
Telegraph service .....	3,080,000	3,000,000
Telephone service .....	6,530,000	6,250,000
Crown lands (net) .....	530,000	545,000
Receipts from Suez Canal shares and sundry loans ..	1,579,972	1,276,882
Fee and patent stamps ..	1,078,000	961,000
Receipts by civil departments, etc. ....	1,225,925	4,956,448
<b>Total revenue .....</b>	<b>£198,242,897</b>	<b>£226,694,080</b>

\* Exclusive of fee and patent stamps.

Expenditure chargeable against revenue is officially stated as follows, for the fiscal years 1914 and 1915:

Expenditure	1913-14	1914-15
<b>Consolidated fund services:</b>		
National debt services .....	£ 24,500,000	£ 22,668,896
Road improvement fund ..	1,394,951	1,528,365
Payments to local taxation accounts, etc. ....	9,734,128	9,529,184
Civil list .....	470,000	470,000
Other .....	1,169,890	1,223,414
<b>Total .....</b>	<b>£ 37,322,969</b>	<b>£ 35,419,809</b>
<b>Supply services:</b>		
Army .....	£ 28,346,000	£ 28,885,724
Navy .....	48,833,000	51,550,000
Civil services * .....	53,901,000	56,956,000
Customs and excise .....	2,431,000	2,479,000
Inland revenue .....	2,052,000	2,123,000
Post office services .....	24,607,000	26,060,000
<b>Total .....</b>	<b>£160,170,000</b>	<b>£168,053,724</b>
Votes of credit—naval and military operations, etc. ....		357,000,000
<b>Total expenditure ..</b>	<b>£197,492,969</b>	<b>£560,473,533</b>

\* Including expenditure on education, science, and art (£19,450,000 in 1913-14 and £20,284,000 in 1914-15) and old-age pensions, labor exchanges, insurance, etc. (£19,666,000 and £20,799,000).

In addition to expenditure chargeable against revenue, there was capital expenditure amounting to £4,220,749 in 1913-14 and £4,293,000 in 1914-15.

The following table shows receipts into the exchequer as reported for the fiscal year 1916 and the estimates for the fiscal year 1917:

Revenue	1915-16	1916-17
Customs .....	£ 59,608,000	£ 71,000,000
Excise .....	61,210,000	62,000,000
Estate, etc., duties .....	31,035,000	30,000,000
Stamps * .....	6,784,000	7,000,000
Land tax .....	660,000	660,000
House duty .....	1,990,000	1,990,000
Property and income tax ..	128,320,000	195,000,000
Excess profits tax .....	140,000	86,000,000
Land value duties .....	863,000	475,000
<b>Tax revenue .....</b>	<b>£290,088,000</b>	<b>£454,125,000</b>
Postal service .....	£ 24,100,000	£ 26,000,000

Post office services .....	26,678,000	26,537,000
Votes of credit—naval and military operations, etc. ....	1,399,652,000	1,600,000,000
<b>Total expenditure..</b> £1,559,158,000		<b>£1,825,380,000</b>

\* The figures represent token votes, the full expenditure being included in the last item, votes of credit. † Including expenditure on education, science, and art (estimated at £19,584,000 for 1916-17), old-age pensions (£12,654,000), and labor exchanges and insurance (£7,693,000).

At the end of the fiscal year 1916, that is, on March 31st, the reported gross liabilities of the British government were about £2,140,000,000, of which £368,000,000 represented advances to the Allies and British dominions. The gross liabilities March 31, 1915, amounted to £1,165,801,702, consisting of the following: funded debt, £583,290,097; estimated capital liability in respect of terminable annuities, £28,040,721; unfunded debt, £497,486,258; other capital liabilities, £56,984,626. The funded and unfunded debts and the capital liability in respect of annuities constitute the so-called "dead-weight" debt, which, on March 31, 1915, amounted to £1,108,817,076, as compared with £651,270,091 on March 31, 1914, £713,245,408 in 1910 and £755,072,109 in 1905. See BANKS AND BANKING; FINANCIAL REVIEW; PRICES, and below under *History*.

ARMY. See MILITARY PROGRESS.

NAVY. See NAVAL PROGRESS.

GOVERNMENT. The executive authority is vested in the King, acting through a ministry appointed by him and responsible to the House of Commons. The legislative power is exercised by the Parliament, which consists of the House of Lords and the House of Commons. An act to establish a separate parliament in Ireland was passed in 1914, but its operation was postponed until the termination of the great war. The peers entitled to sit in the House of Lords number 654, including the lords spiritual and temporal and three princes of the blood royal. Members of the House of Commons are elected by direct vote for the duration of a parliament, the maximum duration, in the absence of special legislation extending it, being five years; their number is 670, England being represented by 465, Wales by 30, Scotland by 72, and Ireland by 103.

The King in 1916 was George V, born June 3, 1865. He succeeded to the throne May 6, 1910, as the second but only surviving son of Edward VII. He married July 6, 1893, Princess Victoria Mary, only daughter of the late

Duke of Teck. The heir-apparent is Edward Albert, Prince of Wales, born Dec. 14, 1895.

The Liberal ministry of Herbert Henry Asquith came into power April 8, 1908; it was succeeded May 25, 1915, by a coalition ministry, in which Mr. Asquith retained the premiership. On Dec. 5, 1916, Mr. Asquith resigned, and two days later David Lloyd George (q.v.), who had been secretary of state for war since the death of Earl Kitchener (q.v.), accepted the post of prime minister. The members of the new ministry who constitute the cabinet were as follows: Prime Minister and First Lord of the Treasury, David Lloyd George (Liberal); Lord High Chancellor, Sir Robert Bannatyne Finlay (Unionist); Lord President of the Council, Earl Curzon (U.); First Lord of the Admiralty, Sir Edward Carson (U.); Secretary of State for Home Affairs, Sir George Cave (U.); Secretary of State for Foreign Affairs, Arthur J. Balfour (U.); Secretary of State for the Colonies, Walter Hume Long (U.); Secretary of State for India, Austen Chamberlain (U.); Secretary of State for War, Earl of Derby (U.); Chancellor of the Exchequer, Andrew Bonar Law (U.); Secretary for Scotland, Robert Munro (L.); Chief Secretary to the Lord Lieutenant of Ireland, Henry E. Duke (U.); Postmaster-General, Albert Illingworth (L.); President of the Board of Trade, Sir Albert Stanley; President of the Local Government Board, Baron Rhondda (L.); President of the Board of Education, Herbert A. L. Fisher (U.); Chancellor of the Duchy of Lancaster, Sir Frederick Cawley (L.); First Commissioner of Works, Sir Alfred M. Mond (L.); Attorney-General, Sir Frederick E. Smith (U.); Minister of Labor, John Hodge (Labor); Minister of Munitions, Christopher Addison (L.); Minister of Blockade, Lord Robert Cecil (U.); Minister of Pensions, George N. Barnes (Lab.); Food Controller, Baron Devonport (L.); without portfolio, Arthur Henderson (Lab.), Lord Milner (U.); Lord of Privy Seal, Earl of Crawford (U.).

#### HISTORY

THE COST OF THE WAR AND THE BUDGET. Toward the close of 1915 Mr. Asquith, on asking for a vote of credit, estimated that the liability of the war would amount to about £5,000,000 a day. At the close of the fiscal year March 31, 1916, it was found that the average daily cost had been well below this limit. The figures available at that time showed the conditions to be as follows: The debt on March 31, 1914, had been \$3,256,350,000. During the war period, including the vote of credit passed on Feb. 21, 1916, for \$2,100,000,000, the total credits were \$10,410,000,000, which the Premier characterized as not only beyond precedent, but actually beyond the imagination of financiers of Great Britain, or any other country. The government congratulated itself on the excellent state of British credit, remarking the extraordinary fact that after 18 months of war, Great Britain should be almost the only open gold country in the world, and that British paper could be exchanged for gold at the bank.

Before asking for a new vote of credit Mr. Asquith declared that the financial burden could be met only by taxation and by severe economy. Taxation by itself would be inad-

quate. It was necessary to maintain credit and to keep up production and the export trade. It was also necessary to cut down unsparsingly on needless imports and consumption of luxuries, and this should be done in private as well as in public affairs. Mr. McKenna, Chancellor of the Exchequer, introduced in the House of Commons early in April the fourth war budget. The main points in this budget were that out of the estimated expenditure of £1,825,000,000 pounds, the Chancellor proposed to obtain nearly £500,000,000 from revenue. The estimated expenditure was no higher than had been foreseen since the previous September, and it represented practically the £5,000,000 a day which the Premier had previously mentioned. The new taxes included taxes on admission tickets to theatres, moving pictures, football matches, and horse races, and on railway tickets, house matches, table waters, cider and perry. There was an increase in the income tax, motor tax, motorcycle tax, and taxes on sugar, cocoa, coffee, chicory, and excess profits.

In August the Chancellor presented an account of the financial position of Great Britain, after two years of war. The showing on the whole was favorable. He estimated the indebtedness at £3,440,000,000; advances to Allies and dominions, £800,000,000; net indebtedness, £2,640,000,000; national income, £2,500,000,000 or £2,600,000,000. The national wealth he placed at £15,000,000,000. He held that the country had practically financed itself out of the yearly bills and that if he had not asked for a large loan, it was because such a loan had been unnecessary. The country was able to borrow abroad at a lower rate than any of the other belligerent powers. He said that the national income and indebtedness would come out about even at the end of March, 1917. The national indebtedness would at that time, he thought, be less than one-sixth of the total national wealth, and interest on the debt would be paid out of existing taxation.

On December 14th Mr. A. Bonar Law who had succeeded Mr. McKenna as chancellor of the exchequer moved a new vote of credit (the fourteenth since the beginning of the war) for £400,000,000, which was promptly granted. This brought the total since the outbreak of the war to £3,532,000,000. This statement showed the daily expenditure had risen to £6,710,000.

**MEASURES OF ECONOMY.** The committee to consider means of retrenching the cost of government services reported in February. The report did not make any radical recommendations. The reason why reduction beyond a certain scale was regarded as impossible, was because the great increase of the civil expenditure in recent years had arisen from a policy definitely determined by Parliament, namely, the policy that involved social legislation, such as old-age pensions, labor exchanges, national insurance, etc. There could be no wholesale reduction without restricting state activities in this domain. If this were to be done Parliament would have to act in the matter very radically. A number of temporary retrenchments were suggested for the most part on the principle that any work in the public departments that was not of vital importance must be deferred. The movement for husbanding the resources of the nation in all particulars gath-

ered force as the year went on. A memorial signed by many prominent persons urged the cabinet to take measures in view of the serious needs for raising money and in forcing economy in all possible ways. There was especially emphasized the need of encouraging thrift among all classes. The War Savings Committee of the Government began on February 17th, to issue a series of appeals with the latter end in view. It urged the people to check certain forms of expenditure as wasteful, and as drawing labor from useful fields. It mentioned the use of automobiles and motorcycles for pleasure. Later, on February 23rd, it urged a general reduction in the scale of living, in large private establishments, and the cutting down of domestic labor. A national savings campaign was begun on March 1st, when a meeting was held in London. Lord Kitchener said, that "Either the population must go short of many things or the army must go short of munitions and other indispensable things." On December 5th the Board of Trade issued an ordinance prohibiting after December 18th any hotel, restaurant, or public place from serving meals of more than three courses between 6 P. M. and 9.30 P. M. or of more than two courses at any other time.

**ECONOMIC DIFFICULTIES.** The shortage of labor in 1915, together with the increase in wages and the substitution of unskilled for skilled workmen and workingwomen, had led on December 9th to a coalition of workmen numbering 2,000,000 in the Miners' Federation, the National Union of Railwaymen, and the National Transport Workers' Union. In June, 1916, a trade union congress pointing to the fact that prices had risen 59 per cent urged the government to regulate prices and to assume ownership of all merchant shipping. It also demanded a 50 per cent increase of all old-age pensions and an increase of the taxes on large incomes. Another difficulty was one that Earl Curzon pointed out in May, namely, the extraordinary decrease in mercantile tonnage, owing to the requisitioning of the vessels for war purposes. He placed this depletion at 43 per cent and estimated that for ordinary commerce only about the same amount was left. This required the reduction of the volume of trade, and a series of proclamations was published beginning on February 15th, prohibiting the importation of large classes of bulky commodities and commodities that were not indispensable. The effect of this measure was to reduce within a short time the tonnage of the imports by more than 2,000,000.

On October 10th Mr. Runciman announced that in view of the difficulty of getting supplies of wheat and the danger of leaving it exclusively to private enterprises, the government had created a Royal Commission with power to secure an adequate and regular supply. This commission would control the importation of wheat into the United Kingdom. The measure was received with approval, and the commission was appointed. The terms of its duties were as follows: To inquire into the supply of wheat and flour in the United Kingdom; to purchase, sell, and control the delivery of wheat and flour on behalf of His Majesty's government; and generally to take such steps as seem desirable for maintaining the supply. See **STRIKES; WOMEN IN INDUSTRY.**

**TRADE AFTER THE WAR.** The discussion of the measures to be taken to prevent commercial aggression and to provide for the restoration of the trade of the Allied powers after the war, assumed more definite form early in the year. An important debate was held in Parliament on January 10th, when a motion was introduced, calling upon the government to consult with the dominions with a view to increasing the power of the Allies in the prosecution of the war by means of a complete economic coöperation throughout the Empire with the purposes of the Allied governments. It was argued that before and during the war Germany's economic and military policy had been one and the same; that Germany had regarded trade as a weapon of offense; that she was prepared to use it in the same way at the end of the war; and that it was the business of the Allies to prevent her from resuming her economic offensive. Whereas with Great Britain, trade had always been a matter of individual enterprise, Germany had controlled and systematized her entire commerce, with an almost military discipline. Henceforth from the point of view of the Allies, trade could not be looked upon as a friendly rivalry without regard to nationality. Therefore it was proposed that trade measures with the dominions and between the Allies should be taken in order to convince Germany and the world that any aggressive commercial scheme on Germany's part would be a failure. The debate did not bring out any very definite proposals, but it paved the way to wide discussion of the matter in the press. At the meeting of the British Association of Chambers of Commerce in London on February 29th, more than 1000 delegates from all the great commercial associations of the country were present. The main point discussed was the question of change in the present tariff system, on the ground that it had by its practically free admission of foreign imports been one of the chief means of building up German industry. The Chancellor of the Exchequer, Mr. McKenna, was present, and in an address to the executive committee said that the government was not committed to its old economic policies, in so far as change was needed to adapt them to war conditions. Among the more important resolutions adopted were, first, a declaration that the experience of war had shown that safety depends on Great Britain's possessing the power to produce what she needs from her own soil and factories, rather than the possession of values which required exportation and exchange; second, a resolution providing first for preferential trading relations between all British countries, second, for reciprocal relations between the British Empire and Allied countries, third, for favorable treatment of neutral countries, fourth, for restriction of all trade relations with enemy countries, so as to make it impossible to return to the conditions that prevailed before the war. A tariff resolution was also passed urging the government to take steps to foster and safeguard British industries, the words "foster and safeguard" being substituted for the word "protect," which had been at first proposed. In addition to these there were resolutions providing for consulting the dominions and colonies in regard to war problems, and especially

in regard to reciprocity agreements, and for future trade relations with the Central Powers, and finally, a resolution for the appointment at once of a minister of commerce and industry of cabinet rank to be chosen from the business element.

**THE PARIS CONFERENCE.** The much discussed Paris conference took place from June 14th to June 17th inclusive, and its results were received with great satisfaction on all sides in Great Britain. There the public opinion seemed to regard as most important the resolution that Germany should be denied the most favored nation treatment, after the war, and the recommendations for the maintenance of essential industries in the Allied countries in order to secure economic independence. Other measures that attracted much attention were the plan for discrimination against Germany after the war, and the need of immediate economic organization of the British Empire along the lines favored by Mr. William M. Hughes, whose speeches on the subject had attracted much attention not only in England but throughout the entire Empire. See *FRANCE, History; HUGHES, WILLIAM M.; TARIFF; WAR OF THE NATIONS.*

**TRADING WITH THE ENEMY ACT.** This measure as amended passed the House of Commons on January 25th, and received the royal assent on January 27th. It was designed for the destruction of German influence over British trade and its provisions were drastic. The Board of Trade was empowered to prohibit persons of hostile origin or associations from carrying on their business during the war, or actually to compel them to wind up their business. It forbade British firms and individuals to trade with any firm or individual in a neutral country who had German associations. Another aim of the bill was to force German shareholders out of British companies, and to this end any interest owned by such shareholders in these companies could be disposed of by the Public Trustee at a reasonable price. The Public Trustee also might take possession of any enemy patents which had not been completed at the outbreak of the war. This Trading with the Enemy Act went further than its predecessors and it looked even to continuance beyond the close of the war if a trade war should develop at that time. While the previous acts were confined to the duration of the war, this one was not to expire until repealed by order in council.

The act of December 23rd caused much concern to the United States government and diplomatic correspondence followed. This was published on April 13th. See the article **UNITED STATES.**

**CONSCRIPTION.** On January 4th, Lord Derby submitted a report on the effect of the new military measures. According to this the number of unstarred men, who had not offered themselves, was 651,160, but of these many were not liable on account of medical unfitness, or other cause. It will be remembered that a pledge had been made the previous year to the married men that the unfair operation of the recruiting system would be remedied. To keep this pledge the Military Service bill was introduced, calling on unmarried men, and childless widowers between the ages of 18 and 45, who had not attested under the Derby plan, to at-

test at once. They were to have all the rights of exemption and appeal accorded by that plan; the law was to last only through the present war, and Ireland was excluded. The bill encountered vigorous opposition from a minority, consisting of Nationalists, Liberals, and members of the Labor party, but this opposition was reduced as a result of discussion and explanations in Parliament, and on the third reading it was carried by 383 against 36, that is to say, a majority of 347. The government had declared that unless the bill were voted it would be seriously hindered in the prosecution of the war. To the objection that it threatened to introduce the principle of industrial conscription, the government declared that its framers had had no such intention and that it would create machinery and safeguards to prevent such a result.

The attitude of the workmen in general toward the Military Compulsion Bill seemed on the surface contradictory, that is to say, at the British Labor Party Conference at Bristol on January 27th, by a vote representing 1,716,000 against 360,000 conscription was condemned in principle, and the Military Compulsion Bill was opposed, but at the same time a motion to agitate for its repeal was defeated by a vote representing 649,000 against 614,000. This was probably due to the feeling that while the workmen wished to show themselves opposed on principle to militarism they also wished to make it clear that they did not intend to hamper the government in carrying on the war. The Labor Conference in its final session sanctioned by an overwhelming majority the participation of Labor members of Parliament in the Coalition cabinet.

The bill had excused from service the following classes: Conscientious objectors, men who were the sole support of dependents, men engaged in industries essential to the prosecution of the war, and the clergy of all denominations. On February 14th, a proclamation was issued calling to the colors all single men of military age, who were not exempt. On February 21st, recruits of Class 1, that is to say all bachelors who on Aug. 15, 1915, had reached the age of 18, were required to report for duty before March 31st. On March 16th the married men who had attested held a meeting in London to protest against the laxity shown by the government to single men. They said that there were still 2,000,000 men available and that the married men would refuse to serve unless the single men were called to the colors before them. The last day for voluntary enlistment of single men had been March 1st, but although considerable numbers had enrolled, the results were disappointing. This was attributed to the readiness with which single men, especially those engaged in work required by the government, could secure exemption.

The failure to meet the military needs led in March to renewed agitation for universal service, and on May 3rd a radical conscription measure was introduced. Its provisions as explained by the Prime Minister were as follows: All males between the ages of 18 and 41 either married or single, were subject to compulsory enlistment, and every male on reaching the age of 18 was liable. The service of the men now in the army whose time would otherwise ex-

pire was extended for the period of the war. All time-expired men were to be recalled if they were under 41 at the passing of the bill. A special reserve was formed for men who might be employed either in civil work or in military service as was required. The bill passed its third reading on May 23rd by a vote of 250 to 35, and was signed by the King on the 25th. It authorized the government to call to the colors all males liable to service. It provided for an industrial army of reserve to which the government could assign as many men as were required. All males between 18 and 41 years of age, married or single, were liable to service. The attempt to amend it by a clause extending conscription to Ireland, was defeated without division on May 9th. Mr. Lloyd George (q.v.) in reply to a motion to reject the principle, declared emphatically that he would prefer to be ruled out of his party, and to abandon his political career rather than to refuse to the military authorities the men of whom they had need, and he concluded "Until Russia has completed her equipment so as to employ her immense reserves of men it is essential that France and Great Britain put every available man in the field."

As to the increase of the army during the war Mr. Asquith, in the course of an address in the spring, pointed out that in time of peace at the beginning of the war the total forces both in the army and navy were about 600,000. At that time, that is to say, May, there were 5,000,000. The number of divisions in the army had been increased from 26 at the beginning of the war to 83. Exact figures for British enlistment since the beginning of the war were, however, for the first time made public by the King on May 25th. They were 5,041,000 men.

The trouble with the conscientious objectors became more acute in the spring. On April 12th it was reported that two had been tried by court-martial and sentenced to two years' imprisonment at hard labor. In May it was reported that many whose objections to military service had been overruled by the authorities were court-martialed for disobedience of military orders, and on June 24th the government announced in the House of Commons that 34 conscientious objectors at the front who had refused to perform certain military duties had been sentenced to death, but that the sentence had been commuted to penal servitude.

THE DOMINIONS AND THE WAR. From the first there had been marked evidence of loyalty to the Empire in its time of danger and as the months passed the aid rendered by the Dominions increased. In the middle of the year 1916 the number of men raised for Great Britain by the self-governing dominions and India was estimated at almost 1,000,000. Of these Canada had contributed the largest share, the number of her troops at the front being estimated toward the end of June at three full divisions, the number of recruits at 345,000, the number sent overseas at 225,000. Australia in June had sent about 20,900 and at the same time New Zealand had sent about 49,000. South Africa, besides supplying forces for the conquest of German East Africa and German Southwest Africa, had sent a body of troops to France and from India there had come about 300,000. Besides this evidence of imperial solidarity there were signs of a movement for a

more compact imperial organization. One of the leading advocates of closer imperial federation was Mr. William M. Hughes (q.v.), Premier of Australia, who conferred with the New Zealand and Canadian governments, visited England and participated in the discussion of the cabinet and the War Council. He also was a representative at the Allied Economic Conference in Paris. He made speeches on the subject of imperial solidarity which attracted wide attention. See also CHILD LABOR; CITY PLANNING; COÖPERATION.

**MINISTRY OF BLOCKADE.** On March 2nd, Lord Newton was appointed to take charge of certain departments of the Foreign Office hitherto directed by Lord Robert Cecil, who in turn was appointed Minister of Blockade. This new office of blockade minister was announced in the House of Lords on February 22nd, by the Marquis of Lansdowne, the government having decided to place under a single minister the charge of matters connected with the blockade of Germany. He was to have charge of the administration of the orders in council, regulating the blockade, and was to be responsible also for the policy and practice of the government as to trade passing to and from neutral countries. Lord Cecil retained his office of under secretary of state on becoming minister of blockade.

**DEFENSE OF REALM ACT.** By this statute very extensive power had been conferred upon the sovereign under the general head of "regulations for securing the public safety and the defense of the realm," so long as the war continued. Under this act some of the historic guarantees of individual liberty were sacrificed without complaint. Although in the past the habeas corpus acts had been suspended on several occasions no measure ever went so far in bestowing discretionary powers upon the Crown. In January a test case was brought before the Divisional Court involving the authority under recent legislation of the King in council to arrest and keep in prison one of his subjects without trial. The court held that by virtue of the regulation made under the Defense of the Realm Act the King had this authority. The decision of the Divisional Court was later upheld by the Court of Appeal. Another regulation under the same general statute empowered the Secretary of State at his discretion to intern persons of "hostile origin or associations."

**AÉRIAL SERVICE.** The resignation of the Earl of Derby, chairman, and Lord Montague, vice-chairman of the joint National and Military Board in charge of the aerial service, was announced on April 11th. Their withdrawal was attributed to dissatisfaction with the present organization, both desiring that that department be centralized and coördinated. There was considerable dissatisfaction on all sides with the air service, especially with measures taken for the protection of London. On May 17th, during a debate in the House of Commons the government announced that it had decided to create an Aerial Board which was to advise the Admiralty and the War Office in regard to the service, and that the president was to be Earl Curzon. The spokesman for the government denied the superiority attributed to the German air service, saying that the English service had won a great majority of the combats in

the air, and was really in many respects superior; moreover, that the British service now possessed two types of aeroplanes which were faster than the Germans', and that there were two other types which were quite as fast as the German Fokker. See AÉRONAUTICS.

**SINN FEIN MOVEMENT.** The Sinn Fein organization which brought about the most serious and the most ably directed rebellion in Irish history since 1798, was founded in 1905, for purposes not unlike those of the Gaelic League which preceded it by a few years. The words Sinn Fein mean "Ourselves Alone," and the central idea of the society was that the Irish people should recover and assert its nationality in every possible way, in language, in dress, in the development of Irish resources and industries, and in progress along national lines. Unlike the Gaelic League, however, whose programme was exclusively educational, its scope was political from the first. It opposed Irish representation in the British Parliament and attacked the Nationalist party, whose members in Parliament it accused of being tools of the Liberal party and indifferent to the Irish cause. It demanded that they withdraw from Parliament and devote themselves to their own country. As another evidence of distinct nationality, the Sinn Fein urged the creation of an independent Irish consular service. With Irish consuls in all the large cities of the world, attention would be drawn at once to the national aspirations of Ireland. Friends for the cause would be won and in the long run such a service would open opportunities for Irish trade abroad. It had no patience with the Home Rule plan. It held that Ireland should not wait for Home Rule as a gift from the British Parliament, but should start measures of independence on her own account. Self-reliance was the Sinn Fein's motto. It was inspired at first by Mr. Arthur Griffith, a journalist of marked force and ability who expounded its doctrines in a weekly newspaper and drew to him a small body of very zealous followers, some of them intellectuals, others men impatient of parliamentary methods, and still others men fired with the traditional hatred of the English. The Sinn Fein made little headway. The agricultural population were fairly well satisfied with the land situation and wanted to be left in peace. The Nationalist party and the Nationalist press ridiculed it. Politically, it was regarded as of little importance in general, but the Unionist press supported it mildly as a weapon against the Nationalists. The Sinn Fein took sides with the Larkinites in 1911 and 1912, but gained little from the union and after the introduction of the Home Rule bill there seemed for a time to be little public interest in the movement. The formation of the Irish Volunteers toward the end of 1913 improved its chances. It associated itself with the Irish Volunteer movement in which it became the controlling element.

**OUTBREAK OF THE IRISH REBELLION.** The first act of the Sinn Fein rebels was the seizure of Stephen's Green, the post office and other buildings in the centre of Dublin on Easter Monday, April 24th. At the same time a proclamation was issued asserting the right of Ireland to national existence and announcing the foundation of a new republic, based on adult suffrage and complete civic and religious lib-

erty, equality, and fraternity. The flag of the new state was green and gold. A provisional government was set up with headquarters in Liberty Hall under Padraic Pearse (q.v.), president, James Connolly (q.v.), commandant in Dublin, Messrs. Clarke, MacDonagh, Ceannt, Plunkett, and MacDiarmad. After a sharp struggle in which many were killed and wounded, including a considerable number of civilians, the British forces, under Major-Gen. Sir John Maxwell, who had formerly commanded in Egypt, succeeded in overpowering the rebels, not, however, until they brought artillery and machine guns into play and mowed down great numbers of them. On April 29th, the provisional president, Pearse, ordered unconditional surrender in order to prevent useless slaughter, and the rebels laid down their arms on April 30th. In Dublin 300 had been killed and 1800 made prisoners. The British troops lost 521 men. The attempt of Sir Roger Casement (q.v.) was made on April 21st. He was trying to land from a German submarine off the Irish coast when he was captured. At the same time a German ship carrying munitions accompanied the submarine and was sunk and the crew made prisoners. Sir Roger was imprisoned in the Tower and afterwards tried by the High Court of Justice, which on June 29th found him guilty of treason and sentenced to be hanged. The punishment inflicted by the government was extremely severe. In May, Pearse, Clarke, MacDonagh, Plunkett, and 11 others were tried in secret court-martial and shot. The Countess Markiewicz, who had been one of the most active of the combatants, was sentenced to death, but this was commuted to penal servitude for life. A large number were condemned to long terms in prison. Several hundred were taken to England and the number of those arrested was placed at 3000. From the first the Irish administration was severely blamed for its weakness and lack of foresight. Mr. Augustine Birrell, Chief Secretary, Sir Matthew Nathan, Under Secretary, and Baron Wimborne, Lord Lieutenant, resigned early in May and the acceptance of their resignations was announced on June 22nd.

**THE ROYAL COMMISSION.** The causes of the revolution were investigated by a Royal Commission under the chairmanship of Baron Hardinge, which began its session on May 10th. Its report was published on July 3rd. It brought out that there were only 2255 available British troops in Ireland on April 24th. It condemned the course of Mr. Birrell and impliedly the entire cabinet for weakness in allowing the Ulster and Nationalist Volunteers two years before to threaten a civil war and make actual preparations for it and for paying no heed to serious warnings given him as early as February.

**THE HOME RULE COMPROMISE.** The Nationalists, headed by Mr. Redmond, remained loyal and condemned the insurrection, but the severity of the government roused at first discontent and later extreme indignation. The criticism became so severe that measures of adjustment were necessary and Mr. Lloyd George was delegated by the cabinet to arrange a compromise with the Irish leaders. The main point in his programme was that the Irish Home Rule Act of 1914, known as the Government of Ireland Act, should go into effect at once after

Y. B. 16—11.

certain serious modifications, of which the most important was that Ulster should be temporarily excluded; a parliament was to be set up in Dublin for the other provinces with a Lower House consisting of the Irish members of the British House of Commons with the exception of the 25 from Ulster, and a senate to be chosen by proportional representation; the 103 Irish members in the British House of Commons were to be retained. This settlement was to be regarded as temporary, and on the conclusion of peace a revision of it was to be considered at an imperial conference which would reconstitute the entire machinery of the imperial government. The Nationalists, under the influence of John Redmond, unwillingly accepted the compromise. The Sinn Feiners and the irreconcilable Unionists opposed it. It was doubtful whether the Unionist members of the cabinet could be prevailed upon to accept it and it was feared that the coalition would be broken up. In fact, the Unionist minister, Earl Selborne, president of the Board of Agriculture and Fisheries, resigned on June 25th, saying that he could not approve the putting into effect of any Home Rule plan during the war, though he was willing that it should be discussed. Mr. Asquith, however, with his usual adroitness in effecting compromises, won over Unionist sentiment by concessions, and on July 10th was able to declare that the cabinet would support Lloyd George's measure. The delay in putting this measure into effect caused much irritation among the Nationalists, who were further exasperated by Lord Lansdowne's declaration of July 11th that the success of the compromise required the retention of General Maxwell and 40,000 troops in Ireland, and by Mr. Asquith's disclosure on July 24th of the points in which he had yielded to the Unionists' demands. He said that Ulster's exclusion should be permanent and that the number of Irish members at Westminster must be reduced even before the final settlement after the war. The demand of the Nationalists was expressed by Mr. Dillon in a speech early in August in which he said, Either trust the people or govern them with a strong hand. He declared that the system of military government of General Maxwell had done more than the Sinn Fein toward stirring up the country. Mr. Asquith declared that martial law had not been enforced, although it had been proclaimed as a safeguard. He expressed the hope that the new secretary, Mr. Duke, a Unionist who had been appointed as Mr. Birrell's successor, would find it possible to discard it. He characterized General Maxwell's administration as tactful and merciful. Mr. Redmond criticised the government for the appointment of a Unionist. He appealed to Parliament and the people to bear in mind Ireland's part in the war, and the fact that there were some 150,000 Irishmen fighting in France. The critics of the government characterized the Prime Minister's course as halting and inefficient.

**CHANGE OF MINISTRY; REORGANIZATION.** At the end of November rumors of impending changes in the ministry were circulated, and during the first week in December it became definitely known that there were serious dissensions in the government between the Premier and Mr. Lloyd George. After conferences with the King and with other members of the

cabinet Mr. Asquith announced his resignation. After the refusal of Mr. Bonar Law to become prime minister, Mr. Lloyd George was invited to form a ministry and his acceptance was announced on December 6th. The composition of the new cabinet and the reorganization of the War Council were made public on December 10th. The latter was to be made up of Mr. Lloyd George, Prime Minister, Lord Milner, and Mr. Arthur Henderson, both without portfolios, that they might give all their time to the Council, and Earl Curzon and Mr. Bonar Law; the two last-named being government leaders in the Upper and Lower House respectively were not expected to be regular in their attendance. See above paragraph on *Government*.

This change was regarded as a radical departure, involving centralization of both the civil and the military administrations. The powers vested in Mr. Lloyd George were described as virtually dictatorial, as unprecedented in recent British history, and in fact as exceeding those of any ruler of the present time. His appointment had been opposed by strong elements in Parliament but seemed to be approved by the public and was enthusiastically applauded in France. Radical measures of reform were announced, including the complete governmental control of liquor manufactures. Prominent business men were called to office. Especial confidence was inspired by the appointment of Baron Rhondda, a coal magnate, as President of the Local Government Board; of Baron Devonport as Food Controller; of Sir Joseph Paton Maclay as Shipping Controller; and by the choice of other experienced men of affairs. There was criticism of the choice of Mr. Arthur J. Balfour as Foreign Secretary, who was condemned by many on his record in the Admiralty, by those who demanded a more aggressive naval policy, but on his behalf it was urged that he was better versed in foreign affairs than any one else and that like Viscount Grey, he was friendly to the United States and would carry out the same policy of respect for the traditional spirit of international law.

**ATTITUDE TOWARD PEACE.** A good many significant declarations were made by prominent members of the government in the course of the year as to the terms on which the Entente Allies would consent to peace. The principal points insisted upon were the liberation of small nations, and the extinction of the Prussian military domination. This latter was interpreted by Mr. Asquith in a speech delivered before the visiting French senators and deputies in London on April 10th. He said: "As a result of the war we intend to establish the principle that international problems must be handled by free negotiation on equal terms, by the free people, and that this settlement shall no longer be hampered or swayed by the overmastering dictation of a government controlled by a military caste. That is what I mean by the destruction of the military domination of Prussia—nothing more, but nothing less." For an account of the discussion of terms of peace at the close of the year, see **WAR OF THE NATIONS**.

**GREECE.** A maritime kingdom in south-eastern Europe, lying between the Ionian and Ægean seas. It consists of 26 nomes, or departments, besides Crete and the new Turkish cession. Capital, Athens.

**AREA AND POPULATION.** The total population in 1879 was 1,973,768. The area previous to the Balkan wars was given at 64,657 square kilometers (24,964 square miles), with a population in 1907 of 2,631,952. The area, population (1907), and density of the 26 nomes, and also of Crete, together with figures of the new Turkish cession are given in the following table:

	Sq. km.	Pop.	D.
Acarmania and Ætolia . . . . .	5,225	141,405	27
Achaia . . . . .	3,136	150,918	48
Arcadia . . . . .	4,357	162,324	37
Argolis . . . . .	2,585	81,943	32
Arta . . . . .	1,383	41,280	30
Attica . . . . .	3,127	341,247	108
Beotia . . . . .	3,117	65,816	21
Cephalonia . . . . .	763	71,235	98
Corfu . . . . .	681	99,571	146
Corinthia . . . . .	2,370	71,229	30
Cyclades . . . . .	2,719	130,378	48

\* 46,345 square miles.

Greece took formal possession, March, 1916, of northern Epirus, which she had occupied, with the consent of the powers, in November, 1914. Besides Crete, with an area of 8618 square kilometers, the area acquired from Turkey includes the insular districts of Lesbos, Samos, and Chios, the estimated area of which is 4018 square kilometers, and, on the mainland, the districts of Saloniki, Kozani, Florina, Serres, Drama, Janina, and Prevesa, aggregating about 42,760 square kilometers.

The principal towns with their 1907 population, follow: Athens, 167,479; Piræus, 71,506; Patras, 76,724; Corfu, 27,397; Volo, 23,563; Larissa, 18,041; Trikkala, 17,809; Hermoupolis, 17,773; Pyrgos, 13,690; Zante, 13,580; Kalamata, 13,123; Chalcis, 10,958; Tripolitza, 10,789; Laurion, 10,007. Approximate population of the principal towns in the territory ceded by Turkey: Saloniki, 158,000; Candia, or Iraklion (Crete), 25,000; Canea (Crete), 24,200; Kavala, 23,400; Serres, 18,700; Janina, 16,800.

The emigration to the United States (United States records) has been as follows: 1913-14, 45,881; 1912-13, 38,644; 1911-12, 31,566; 1908-09, 20,262.

The national religion is the Orthodox Greek. Although the law provides for the compulsory instruction of children between the ages of six and twelve, it is not uniformly enforced; 30 per cent of army recruits are illiterate and 15 per cent can read only.

**INDUSTRIES.** The surface of the country is largely mountainous, and only about one-fifth of the total area is cultivable. Yet agriculture is the principal industry, though the methods are antiquated; the chief crops are currants, grapes, cereals, tobacco, citrus fruits, olives, and figs. The area of old Greece under cultivation

**ARTHUR HENDERSON**  
Minister without Portfolio

**ANDREW BONAR LAW**  
Chancellor of the Exchequer

**EARL CURZON**  
Lord President of the Council

**FOUR MEMBERS OF THE WAR COUNCIL OF GREAT BRITAIN**

is given at about 5,563,000 acres—1,112,000 under cereals, 1,200,000 fallow, 2,025,400 under forests. There are in addition 5,000,000 acres under meadow and pasture. The principal crop is currants, with an annual average yield of 150,000 tons, which far exceeds the export; the surplus is utilized in the manufacture of denatured alcohol. The law limiting the output has resulted in the uprooting of many large plantations (estimated at about 35,000 hectares). The cereals grown are wheat, barley, rye, corn, and maslin. The output of currants in 1914 was 158,000 tons; olives, 50,000,000 oke (1 oke equals 2.85 pounds).

Live stock, as reported for 1914: horses, 149,000; mules, 79,500; asses, 132,800; cattle, 300,000; sheep, 3,546,600; goats, 2,638,000; swine, 227,200. Sericulture is carried on. In the territories rice and tobacco are largely grown.

Mining concessions cover a total of about 20,000 acres, and yield iron, manganese iron, iron pyrites, lead, nickel, zinc, magnesite, chromite, emery, etc.

COMMERCE. The trade for comparative years is shown in the following table, values in thousands of drachmas (the par value of the drachma is 19.295 cents):

	1910	1911	1912	1913	1914
Imports	160,536	173,510	157,657	177,938	175,135
Exports	144,571	140,908	146,163	119,001	117,134

The principal articles of import for consumption and exports of domestic produce are shown below, with value for the year 1913 in thousands of drachmas:

Imports	1000 dr.	Exports	1000 dr.
Cereals	31,496	Currants	40,663
Yarns, etc.	19,899	Tobacco	19,616
Fuel	18,985	Olive oil	15,317
Timber	14,566	Wine	12,510
Chem. prods.	7,932	Arg. lead	8,561
Mins. and meta.	7,526	Figs	6,017
Sugar	6,466	Zinc	5,698
Fish	5,969	Spirits	4,043
Coffee	4,087	Olives	3,948
Animals	3,083	Iron	3,495

The commerce of Crete amounted in 1913 to 21,910,000 drachmas imports, and 18,209,000 drachmas exports (102,835,000 drachmas imports and 81,458,000 drachmas exports in 1812).

The United Kingdom is the leading country of origin and destination. In the 1913 trade, she contributed imports valued at 42,502,000 drachmas, and received exports to the amount of 28,456,000 drachmas; Russia, 35,308,000 and 2,841,000; Austria-Hungary, 29,168,000 and 12,786,000; Bulgaria, 2,838,000 and 904,000; Germany, 13,322,000 and 12,191,000; France, 10,559,000 and 13,615,000.

COMMUNICATIONS. Railways open for traffic in 1914, about 1365 miles, made up as follows: Hellenic Railway, 275 miles; Piræus-Athens-Peloponnesus railway, 468 miles; the Thessalian Railway, 145 miles; Athens-Piræus railway, 6 miles; Attica Railway, 47 miles; Northwestern Railway, 40 miles; Salonica-Gevgeli, 49 miles; Salonica-Monastir, 125 miles; Salonica-Oxilar, 211 miles. Before the war with Turkey (1912-13) Greece was completely isolated by land from the rest of Europe, but it is now intended to connect the Greek with the European railways. The distance is only about 70 miles and the line would have been completed by July, 1915, but for the

European war. It was, however, opened in the spring of 1916 (May 21st). Projects for new lines to the extent of 400 miles are under consideration. Among the lines to be constructed are those from Salonica to Anghista, from Kalambaka to Koshani, from Kalambaka to Sorovichevo, and from Kalambaka to Janina.

The telegraph lines in 1914 had a length of 5735 miles, with 10,130 miles of wire. The number of offices was 795. Receipts, inland telegrams, 3,700,600 drachmas. In 1914 there were 1438 miles of telephone lines, with 5096 miles of wire belonging to six urban systems. Post offices at the end of 1914, 1342.

FINANCE. The 1915 budget is detailed below in thousands of drachmas:

Revenue	1000 dr.	Expenditure	1000 dr.
Direct taxes	56,784	War	58,516
Indirect taxes	113,019	Debt	56,695
Monopolies	18,181	Administration	16,330
Stamps	27,898	Finance	148,462
Dues	9,679	For. affairs	5,535
Pub. utilities	13,025	Justice	11,693
Domains	9,571	Interior	30,295
Various	3,560	Religion, etc.	17,559
Civil contrib.	5,838	Commerce, etc.	7,145
Surplus	3,701	Communications	43,161
Various extraord.	199	Marine	27,469
Total	261,405	Total	422,860

The public debt (Dec. 31, 1914) under control of the international finance commission amounted to 1,067,708,065 drachmas (919,214,000 drachmas gold, 148,494,065 paper): 125,213,637 drachmas not controlled by the international commission, and 145,000,000 drachmas floating debt—a total of 1,337,921,702 drachmas. Unofficially reported Dec. 31, 1915, £46,289,100.

GOVERNMENT. The reigning King, Constantine I, succeeded to the throne upon the assassination (March 18, 1913, in Salonica) of his father, George I, son of Christian IX of Denmark, who was elected king by the Greek National Assembly in 1863. Heir-apparent, Prince George, born July 19, 1890. Constantine married, Oct. 27, 1889, Sophia, Princess of Prussia, sister of the German Kaiser; he has complicated the neutral position of Greece in the European war by pronounced pro-German policies.

## HISTORY

THE GREEK GOVERNMENT AND THE ENTENTE ALLIES. On Jan. 13, 1916, King Constantine gave out to the press his views on the subject of the course of the Entente Allies toward Greece. He said first it was hypocrisy to speak of the violation of Belgian and Luxemburg neutrality on the part of Germany after the conduct of the Entente Powers in Greece. To occupy so large a portion of Greek territory was an act of aggression and the promise to pay for the damage done after the war was over was of no consequence. As to the plea of military necessity it was under that same plea that Germany had invaded Belgium and Luxemburg. Moreover, he said, there had been no military necessity for such acts as the destruction of the Demir Hissar Bridge, and the occupation of Corfu. The course of the Allies, he said, had alienated all the Greek sympathy they had ever had, and added another to the long list of blunders in their Balkan policy. He implied that in yielding to their demands in November the Greek government had been under duress.

Toward the close of 1915 there had been many arrests of alleged spies by the authorities of the Allies and both the German and Greek governments entered protests. Alleging that an air raid had been made by the enemy, the Allies arrested, on January 3rd, the German, Austrian, Bulgarian, and Turkish consuls. Some days before that the Norwegian consul had been arrested. King Peter of Serbia arrived in Saloniki on January 1.

On February 10th Premier Skouloudis laid down the policy of neutrality, saying Greece would fare far worse than under present conditions if she went to war. Former Premier Gounaris sustained this policy. On February 11th the Chamber voted for it by 266 to 6. By royal decree all Greeks belonging to classes from 1892 to 1914 inclusive, and living abroad, except those in Russia, Turkey, Bulgaria, and Rumania, were called to the colors. It was estimated that it would increase the army by 90,000 men.

Another difficulty with the Allies arose in April in consequence of their undertaking to transport Serbian troops from Corfu to Saloniki, by means of the Peloponnesian railroad. This was resented by Greece as a breach of neutrality, and the use of the railway was refused. On May 15th, however, the British Foreign Office announced that the differences between Greece and the Allies on this subject had been amicably adjusted and that there would be no violation of Greek neutrality.

In March a new difficulty arose with the Allies on account of the declaration of Premier Skouloudis that Greece had practically annexed upper Epirus. To this the representations of the Allies replied that that region had been made a part of Albania by joint act of the powers in 1913, and the Greek government then declared that its occupation was merely provisional.

**THE SKOULOUDIS CABINET.** The Skouloudis ministry seemed to be favorable to the Allies, the Premier having represented many times the desire of Greece to maintain a neutrality that would be sympathetic to the Entente Powers and the Allies hoped that the next step would be a ministry that would serve merely as the transition to the return of Venizelos. In May the fall of the Skouloudis cabinet definitely was predicted and there were some changes made in the ministry. For example, the Minister of Finance retired from office and was succeeded by the Minister of Justice, M. Rhallys. The latter took a gloomy view of the financial situation but did not propose new taxes. He met the 380,000,000 franc deficit and the heavy cost of mobilization, estimated at 900,000 francs a day, by merely revising the budget for 1916-17, and carrying out as far as possible measures of economy. The Venizelists showed a tendency to mingle again in public affairs and they assembled in a large, enthusiastic conference, but the government interfered and summarily broke it up under the pretext of disorder. From Venizelist sources it appeared that representatives of the pro-German party had been paid to cause disorder, and this gave the police a pretext for the suppression of the meeting. In Allied quarters it was believed that the forts surrendered to the Bulgars under orders from the Greek government, and secret documents unearthed toward the close of the year were published in support of the charge.

**INTERVENTION BY THE ENTENTE ALLIES.** The

capture of Fort Rupel and the series of forts along the northeastern frontier on May 26th (see **WAR OF THE NATIONS**) caused great consternation in Greece. At Saloniki there were processions carrying British, French, Serbian, and Greek flags, and mass meetings in which violent speeches were made, denouncing the government for its tame submission. The newspapers published protests and appeals were made to M. Venizelos to save the nation.

The Entente Powers now determined to blockade the Greek ports, seize Greek ships, and munitions, and force the demobilization of the Greek military. There was much disaffection among the troops in consequence of their desire to defend their soil against the Bulgars, and to carry out the terms of the Græco-Serbian Treaty. According to ex-Premier Venizelos this applied to the majority of the troops. They were also discontented on account of their lack of pay, for, owing to the bankrupt condition of the government, they were ill-clothed, and left without proper maintenance. Another grievance was that by mobilizing they were unable to vote in the December elections. To this fact was attributed the retention in power of Premier Skouloudis, and the Parliament. The action of the Allies was based by them on the treaties, which they asserted were binding on the reigning family, for the safeguarding of the Greek constitution and Greek integrity. In June it was announced that a French officer had succeeded the Greek commander of the port of Saloniki, and that Greek ships had been excluded from that port; also that Greek ships in French ports were laid under an embargo. The Greek government protested against this Allied interference in an indignant note addressed to the State Department at Washington, and the representatives of the Latin-American governments there. The protest declared that the Allies had, without explanation, violated "traditional principles"; that since June 6th, Greece had been under a limited blockade, her ships had been held up, searched, and taken to naval bases, and in some instances to distant ports, where they had been turned into transports for the Allies. It was complained that as a result Greek food supplies had been cut off, and the sea trade stopped. Further demands were presented by the Allies to the Greek government on June 21st, and a naval demonstration took place before the port of Athens. Meanwhile Premier Skouloudis had resigned and a new cabinet was formed under the former Premier, Alexander Zaimis, who was reported to be neutral, but in sympathy with the Allies. The new cabinet came into power on June 23rd. The elections were fixed for August 7th. On June 27th, the King signed the decree for the demobilization of the army in accordance with the demands of the Allies. (See **WAR OF THE NATIONS, Diplomacy.**) The acceptance by Greece of all these demands of the Allies was announced on June 28th. The Allied Powers contended that they did not require Greece to abandon her neutrality as was shown by their first demanding demobilization. They held that Greece had not shown loyal neutrality. In short, the view of the Allies was that the Greek crown was under German influence, and that German agents in the country were doing all in their power to stir up public feeling against the Allies. There had been, they said, instances of insults offered to their repre-

representatives in the street, and the police, it was said, had permitted demonstrations against the legations. On the night of June 12th the French and British legations had been surrounded by mobs conducted by a policeman in uniform, and it was said that the chief of police drove through the streets at the time of this German demonstration without taking any notice of it.

**ATTITUDE OF M. VENIZELOS.** After the Balkan wars M. Venizelos, according to the account of his attitude given by his supporters, had favored a pacific policy and expected a long period of peace, but after the outbreak of the war Greece was in great danger of attacks from Turkey and Bulgaria. It was his fear that the conditions fixed by the treaty of Bucharest would not survive, and especially lest Turkey might destroy all Greek influence in Asia Minor. Actuated by this fear M. Venizelos had secured from the Allies a recognition of Greek claims in Asia Minor, Sir Edward Grey having said in a note on Jan. 24, 1915, that he would consider favorably any proposal of M. Venizelos. Greece, however, could not enter the war at that time, unless supported by Bulgaria. M. Venizelos therefore tried to induce the King to follow the policy of ceding to Bulgaria Kavala and Drama, but the King would not accept this proposal. The effect of this refusal, the report went on to say, was to build up a greater Bulgaria, and to increase the danger that Greece would sink back into the same position that she held before the Balkan war. The King professed to believe that the Bulgarians would withdraw from the Greek territory after they had driven out their enemies, but the Venizelist party had no such faith. They argued that the Bulgarians should be driven out, and that this could only be done by making common cause with the Allies.

**FURTHER DEMAND OF THE ALLIES.** On November 16th Admiral du Fournet demanded that certain pieces of artillery be turned over to the Allies, and, having met with a refusal, addressed an ultimatum demanding the transfer by December 4th. The ministry under Professor Lambros, who had succeeded M. Zaimis as Premier, after a discussion in council, rejected this demand. On December 1st Admiral du Fournet landed a body of French marines at the Piræus. At first they were well received, but in the afternoon they were fired upon and for two days the city was the scene of fighting and rioting.

**ATTACK ON THE ENTENTE TROOPS AND ON THE VENIZELISTS.** The attack on the troops of the Entente Powers on December 1st and 2nd was reported in the British press as follows: The first hostilities occurred in the southern part of the city, where a French detachment held the depot of Roufus. The first shot, according to the Allies, had been fired by the Greeks. The Greeks at first admitted this, saying that one of their officers had lost his head, but later their journals denied it and attributed the attack to the Allies. The battle extended next to the eastern part of the city, where the Greeks suddenly fired upon the building of the Zappeion, with two gatling guns, placed in a little grove on a hill, while Admiral du Fournet and some French officers were stationed in front of the principal building. The Greeks, concealed in the gardens of the royal palace, fired from the rear, riddling the building with shots. At this

juncture the British marines, about 250 in number, came to the aid of the 150 French troops who had been stationed in that quarter for the past month. The loss of the Allies at this point was placed at three officers and twelve men killed and several wounded. In all parts of this quarter, the Anglo-French troops were at this time in a state of siege and would have had either to surrender or cut their way through, had not the fleet, about five o'clock in the evening, begun to fire shells over the city. Four of these shells fell near the royal palace, thus serving as a reminder to the authorities that the naval forces would come to the defense of the land troops. A new attack was begun by Greek civilians, the so-called Reservists, who fired upon the French officers in spite of the flag of truce. After the renewal of the conflict the Greeks employed cannon. Had not the fleet bombarded the city, the forces in the Zappeion quarter would have been annihilated. In the Piræus, where the city hall and the Standard Oil building were guarded by strong detachments of French and Italians, conditions continued calm. At Athens, in addition to the fighting above mentioned, there were many outrages in the streets. Every Venizelist who appeared in the streets was chased, beaten, and then thrown into prison. It was said that a thousand of them were thus treated and that a hundred were killed or wounded. The worst anarchy prevailed.

**THE VENIZELISTS.** Finding the government opposed to their view, M. Venizelos and four leading members of his party went to Crete, where a movement for the repelling of the Bulgarian invaders had been started. He said that his purpose was to head this movement and spread it throughout Greece, that he was not fomenting a revolution, and that he had no designs against the King or the royal family. Later in the year he appeared at Saloniki. On October 11th he explained that his course in this matter as well as that of his colleagues, Admiral Condouriotis and General Danglis, was due to the fear that if they were inactive they would seem to the citizens to acquiesce in the course pursued by the King, and they hoped that their action might be a final warning to him and that at the last moment he would change his policy. He did not declare that the other government had ceased to exist, but regarded Greece as a state with two coexisting governments. The personnel of the cabinet of the new provisional government was announced at the same time, M. Repoulis being Prime Minister.

A statement attributed to Venizelos on December 27th set forth the general attitude of his party and reviewed the grievances against the King. In the first place, he declared that the Greek refusal to abide by the treaty with Serbia was a dishonorable and impolitic act. The true policy for Greece demanded friendly relations with the Powers that ruled the Mediterranean. He said his followers had no quarrel with the dynasty but that Constantine had become a tyrant and had set up a reign of terror. Hundreds of Venizelists had, he said, been imprisoned and shot without trial. Constantine had become merely the leader of a party and the number of his followers and the strength of his army were dwindling. The Greeks in general were for the Allies. The Greek islands and the new parts of Greece were nationalistic and in old Greece the Venizelists were in a large ma-

jority but the King was trying to suppress them by force of arms. Venizelos wished to avoid disunion and to bend all his energies to fighting the Bulgars. On the part of the Allies he desired the recognition of his government which, he maintained, was supported by the majority, as the responsible government of Greece. He said that the fleet was almost wholly on the side of the Venizelists; and he urged the Allies to turn over to his government the Greek vessels, which they had seized.

**SITUATION AT THE CLOSE OF THE YEAR.** In King Constantine's reply to the peace note of President Wilson, he described the sufferings the country had sustained at the hands of both belligerents, despite its constant efforts to maintain neutrality. This showed, he said, how the Greeks longed for peace and how deeply they appreciated the President's endeavors. He promised a direct reply, supporting the American proposals. At this time the situation was again acute. The Entente Allies, according to a press dispatch on December 31st, presented the day before a note containing a demand for the following reparations and guarantees: Greek forces outside the Peloponnesus must be reduced to the number that was merely necessary for police duty and the arms and ammunition thus set free were to be sent to the Peloponnesus. Right of meeting was forbidden to all reservists north of the isthmus of Corinth and no civilian was to carry arms. The control of the Allies was to be reestablished. All political prisoners were to be released at once. The commandant of the first army corps must be dismissed unless it were found that some other general was culpable. Apologies must be publicly rendered by the government to the flags of the Allies. The latter agreed not to permit the nationalist forces to profit from the withdrawal of the royal troops from the neutral zone. Finally, the blockade of the coast was to continue till full satisfaction was given on all these points. The general situation had been discussed at a cabinet meeting over which the King presided on December 29th. Orders were at once given for the transportation of the Thessalian troops, and it was expected that this movement would be completed by January 5th, and that the Allies would then lift the blockade.

See ARCHÆOLOGY; WAR OF THE NATIONS.

**GREEN, HETTY HOWLAND ROBINSON.** An American financier, popularly known as the richest woman in America, died in New York July 3, 1916. She was born in New Bedford, Mass., in 1835, and came of a Quaker family. Her father, Edward Mott Robinson, became wealthy as a shipowner and merchant, and died in 1865 leaving his daughter a fortune of \$9,000,000. Soon afterward, her aunt, Miss Howland, died, and the will probated by relatives gave Hetty Robinson a life interest in an estate of several millions. She wanted it absolutely, and a bitter contest followed, in which she was beaten. Later she brought to the courts a will in her own handwriting, but with signatures that she swore were her aunt's. This was of earlier date, but it favored Miss Robinson and stated that it was to be considered in preference to any wills of earlier or later date that might be found. After some \$150,000 had been spent in costs and counsel fees, an agreement was reached. However, much bitter feeling had

been aroused among many relatives and neighbors, and Miss Robinson is said never to have returned to her birthplace. She had already become familiar with New York, for as a girl she had stayed there visiting relatives and had been prominent in social life. Her education had been gained largely at a private school in Boston.

In 1867 she was married to Edward H. Green of New York, at one time consul at Manila. He had a fortune of his own, and by prenuptial agreement their interests were kept separate. They went abroad, living in Paris and in London, where a son, Edward H. R. Green, was born. After their return, Mrs. Green took up personally the management of her growing financial interests; her husband finally went into bankruptcy, and they became estranged, but from 1898 till Mr. Green's death in 1902 they were again on friendly terms. It is said that Mrs. Green's ideas of severe economy were not pleasing to her husband. Certain it is that she early gained the reputation for penuriousness which continued to her death. It was for this she was known, as well as for her great wealth, which at the time of her death was computed to be at least \$100,000,000. Many stories have been told of her efforts to save personal expense. For years she lived in a small flat in Hoboken, N. J., and it was only just before the marriage of her daughter, who became the wife of Matthew Astor Wilks, that she took temporarily a suite in the Hotel Plaza. She often protested that if she did not live simply and in obscure places, so many people would be seeking her out that she would have no time for her business. For the same reason, she said, she never allowed her benefactions to be made public.

Hetty Green's fortune was built up through the acquisition of gilt-edged securities. She was cautious in her investments, which consisted largely of bonds and mortgages of the most reliable sort. Wall Street bankers had the highest opinion of her judgment. At the time of the great panic in 1907, and at other times, she was one of the heaviest money lenders. For a time she was a large stockholder in the Chemical National Bank of New York; later she was better known in connection with the Seaboard National, of which her son became a director. Her son had long been active in financial affairs, and it was Hetty Green's wish to make him the richest man in the world. Until a few days before her death, which occurred after several strokes of paralysis, she attended to her affairs. She had become an Episcopalian, and was buried beside her husband at Bellows Falls, Vt., which had been her legal residence.

**GREENLAND.** An island in the Arctic Ocean, a Danish colony. Area estimated at 849,420 square miles; population, 1911, 11,893 of whom 11,621 Eskimos and 272 Europeans. A British source gives 1914 exports to Denmark at £87,555, and imports from Denmark at £47,722.

**GRENADA.** The smallest of the (British) Windward Islands colonies. Area, 133 square miles; population, 66,750; 1914 estimate, 71,080. Cacao is the chief product for export. St. George's (4916 inhabitants) is the capital. Imports 1914, £272,126; exports, £333,374. Revenue, 1914-15, £93,799; expenditure, £95,-

661. Tonnage (1914) entered and cleared, 867,798, of which 860,178 tons British.

**GREY, EDWARD**, first VISCOUNT. A British statesman. During the year he was created a peer of the realm, having been known before as Sir Edward Grey. King George offered him an earldom, but in order to retain his family name and at the same time avoid confusion with Earl Grey, the former Governor-General of Canada, he requested a change to a viscounty. See WAR OF THE NATIONS, *Diplomacy*.

**GROSVENOR, WILLIAM MERCER**. An American Protestant Episcopal clergyman, died in New York City Dec. 9, 1916. He was born in New London, Conn., in 1863, graduated from Williams College in 1885, and three years later finished the course of the Berkeley Divinity School. In 1888-90 he was assistant rector of Grace Church, Brooklyn, then rector of Trinity Church at Lenox, Mass., until 1895, and afterward rector of the Church of the Incarnation in New York till 1911. In this year he was appointed dean of the Cathedral of St. John the Divine in the same city, and until his death this institution was his chief interest. Dr. Grosvenor never married. While he was dean, the cathedral building progressed to the completion of excavations for the nave. Honorary degrees came to Dean Grosvenor from Williams College and New York University. His body was interred in the crypt of the cathedral.

**GROUP INSURANCE**. See INSURANCE.

**GUADELOUPE**. A French colony composed of certain islands of the Lesser Antilles. Area, 1780 square kilometers (687 square miles); population (1911), 212,430. Capital, Basse-Terre. In 1913, imports and exports were valued at 20,174,930 and 18,287,489 francs respectively. The leading exports are cacao, coffee, and sugar. The budget for 1915 balanced at 4,670,290 francs. Debt, Jan. 1, 1915, 3,848,817 francs.

**GUAM**. A territorial possession of the United States. For administrative purposes Guam comes under the navy department, and to facilitate such administration the whole island, with the surrounding islands and keys, has been designated as a naval station. The Governor, who is a naval officer designated by the President, is also commandant of the naval station. The population of Guam exclusive of officers and enlisted men of the navy and marine corps and their families on July 1, 1916, was 13,491, of whom 13,285 were classed as "natives," and the remainder as "foreigners." Of the latter the larger number were Japanese, 104. Only 57 were classed as Americans. The death rate per thousand in 1916 was 21.3. The birth rate 46.7. Imports for the fiscal year ending June 30, 1916, exclusive of naval and military stores and supplies, was \$329,503, of which over \$33,218 was received from the United States and its possessions. The expenditures amounted to \$66,568. The principal export was copra, of which 958,958 pounds were shipped to Japan, and 982,610 to the United States. The principal imports were lumber, rice, flour, tinned and fresh meats, canned provisions, automobiles, kerosene and gasoline, liquor, tobacco, clothing, and cotton goods. The revenue of the insular government was \$91,816, and the ordinary expenditures were \$87,058. There were also expenditures from reserve funds of \$23,569 during 1916. A bank under the auspices of the insular government was founded.

Guam is a station of the Commercial Pacific Cable Company, and cables from Manila, Yokohama, Midway, and Yap Islands are landed there. A high power radio station is being constructed by the navy department and it is expected that the station will be opened for communication in April, 1917. The United States Department of Agriculture maintains an experimental station in Guam. The port of entry is Apra Harbor, 5 miles from Agana, the seat of government. Apra is closed to foreign vessels except by special permission of the United States government. During the fiscal year ending June 30, 1916, 33 vessels having a total tonnage of 120,224 visited the port. The Governor of Guam until April 20, 1916, was Capt. William J. Maxwell, U. S. N., who was relieved on account of sickness. Capt. Roy C. Smith, U. S. N., assumed office on May 30, 1916.

**GUATEMALA**. A Central American republic, bounded by Mexico on the north and west and bordering both the Caribbean Sea and the Pacific Ocean. Capital, Guatemala City.

**AREA AND POPULATION**. Pending the delimitation of the Honduran boundary, the area of Guatemala cannot be stated exactly. One estimate at present is 48,290 square miles, and another is 43,641 square miles. The estimated population Dec. 31, 1913, was 2,119,165. The census of Dec. 31, 1903, showed 1,842,134 inhabitants, of whom about 60 per cent were Indian and the majority of the remainder mestizo. Guatemala City, with suburbs, is supposed to have upwards of 100,000 inhabitants; Quezaltenango, 34,000; Cobán, 31,000; Totonicapán, 29,000; Esquintla, Chiquimula, Jalapa, and Zacapa, about 18,000 each; Santa Cruz del Quiché, 17,000; Jutiapa, 16,000. Births in 1915 are reported at about 78,000, and deaths about 54,000.

**EDUCATION**. As in all Latin-American countries, illiteracy is common, but during his long presidency Estrada Cabrera has sought to promote education. Elementary instruction is free and nominally compulsory. In 1914 there were 1878 public primary schools, with 64,387 pupils; in 1915, 1899 schools, with 65,904 pupils. The primary schools in 1915 were thus classified: kindergartens, 17; mixed schools, 465; elementary schools for boys, 503; elementary schools for girls, 491; complementary schools for boys, 34, and for girls, 37; training schools for boys, 20, and for girls, 6; night schools for workmen, 62; schools of arts and crafts, 3; rural schools, 261. There are a few secondary schools, a law school, a medical school, and several other educational institutions. There is no state church. The prevailing religion is Roman Catholicism.

**PRODUCTION AND COMMERCE**. In general, Guatemala is a country of much fertility. The most important crop is coffee, which, before the great war, was exported largely to Germany. The estimated yield of coffee in 1914 was 918,522 quintals (quintal=101.4 pounds); corn, 4,611,292; wheat, 546,532; beans, 184,426. Estimated banana yield in 1914, 7,933,487 bunches, and in 1915, 8,217,000 bunches. The following figures for estimated production are for 1915: beans, 180,000 quintals; Lima beans, 21,041; rice, 236,832; wheat, 270,000; pepper, 5643; refined sugar, 253,416; panela, 558,193; coarse granulated sugar, 38,391; molasses, 185,054. Reported number of live stock Dec. 31, 1915:

horses, 116,278; cattle, 619,895; sheep, 383,124; goats, 56,600; swine, 102,531. There are valuable forests, in which are worked rubber, chicle, dye woods, cedar, and mahogany. Mining and manufacturing have not attained any great importance.

The reported values of imports and exports have been as follows:

	1913	1913	1914	1915
Imp. . . . .	\$9,822,462	\$10,062,328	\$9,381,115	\$5,072,476
Exp. . . . .	13,156,538	14,449,926	12,754,027	11,566,586

The Guatemalan authorities add 25 per cent to the actual invoice value of imports at the maritime customs houses—an estimate covering freights, insurance, commissions, etc.; this addition is included in the foregoing import values.

The leading imports in 1913 were as follows, in thousands of dollars: cotton goods, 1755; ironware, machinery, and coal, 686; foodstuffs, provisions, and liquors, 507; drugs, 269; woolen goods, 253; linen goods, 222. Principal exports in 1913 and 1914 respectively, in thousands of dollars: coffee, 12,255 and 10,391; sugar, 349 and 354; cattle hides, 455 and 341; wood, 248 and 301; chicle, 151 and 227; rubber, 100 and 94; bananas, 826 in 1913. In thousands of dollars, imports from and exports to the United States in 1913 were 5053 and 3923; Germany, 2043 and 7654; United Kingdom, 1650 and 1600; France, 402 and 21. Similar figures for 1914 and 1915 are shown below:

	Imports		Exports	
	1914	1915	1914	1915
United States . . . . .	4,879	3,752	4,874	6,881
United Kingdom . . . . .	1,390	577	1,477	1,322
Germany . . . . .	1,843	146	5,413	50
France . . . . .	318	124	34	....

**COMMUNICATIONS.** Guatemala has a few good roads, but at any considerable distance from the railway bridle paths afford the usual means of communication and transport.

The railways of Guatemala are operated by the International Railways of Central America, a corporation formed in 1912, and representing a consolidation of the Guatemala Railway (195 miles), the Guatemala Central Railway (139 miles), the Occidental Railway (51 miles), and the Ocos Railway (22 miles). The company's main lines in 1916 extended from Puerto Barrios to Guatemala City, a distance of 194.5 miles, thence to San José de Guatemala, on the Pacific Ocean, a distance of 74 miles. The company is capitalized for \$40,000,000 and has issued bonds in the sum of \$10,850,000. It receives subsidies from the governments of Guatemala and Salvador, ranging from \$5150 to \$11,780 per mile. The Government of Guatemala may purchase the lines after the year 2002 at a price to be decided by arbitration.

An important improvement completed in 1916 and to become effective Jan. 1, 1917, was the newly located 12-mile line leading from Puerto Barrios to Manoca, where connection will be made with the International Company's former line to Guatemala City. The operation of the newly located line involved the utilization of the big tunnel that cuts the high grade at Corozo Hill, 7 miles from Puerto Barrios, thus reducing the gradient from nearly 5 per cent to 0.9 per cent. The reduced grade enabled the road to put into effect an improved passenger schedule,

and at the same time increased the drawing capacity of the engines and permitted betterments in the freight service. The new tunnel was 753 feet long, 16 feet in width, and 18½ feet in height.

Telegraphs in 1915, about 4200 miles, with 245 offices. Post offices, 389.

**FINANCE.** For the fiscal year 1914 revenue and expenditure were reported at 82,399,925 and 48,735,805 pesos (paper) respectively. The approximate average value of the paper peso, which was 9 cents in 1906, declined to 6 cents in 1914, and 2½ cents in 1915. The reported revenue for 1915 was 85,007,704 pesos, consisting of: customs receipts, 63,815,126 pesos; receipts from liquors, tobacco, etc., 10,479,796; other taxes, 6,224,629; telegraphs and telephones, 3,098,169; postal, 1,389,984. Estimated expenditure for the fiscal year 1916, 60,082,637 pesos. The largest disbursements are for the public debt and the army. The foreign debt, with arrears of interest, is reported at £2,357,063. Interest payments were resumed in 1914. The internal debt (1914) is stated at 117,853,635 pesos paper.

**GOVERNMENT.** The executive authority is vested in a president, elected for six years by direct vote. He is assisted by a cabinet of six members. The legislative power is exercised by the National Assembly (69 members) and the Council of State (13 members). Members of the Assembly are elected by direct vote for four years; members of the Council are in part elected by the Assembly and in part appointed by the President. The President in 1916 was Manuel Estrada Cabrera (born 1857), who succeeded to the executive office in March, 1898, and subsequently was elected for terms ending March 15, 1905, 1911, 1917, and 1923. His last election took place Jan. 12, 1916. There is a first designate and a second designate, elected by the Assembly, to act as president in case of the chief executive's death or disability. There was difficulty between Mexico and Guatemala during the summer on account of raids over the border and alleged maltreatment of Mexicans in Guatemala, but it was announced in June that the trouble had been adjusted and that friendly relations had been restored.

**GUAYULE.** See AGRICULTURE.

**GUIANA.** See BRITISH GUIANA; DUTCH GUIANA; FRENCH GUIANA.

**GUNS.** See MILITARY PROGRESS.

**GUNTER, JULIUS C.** Elected Democratic Governor of Colorado, Nov. 7, 1916.

**GYMNASTICS.** The eighteenth annual intercollegiate gymnastic championships were won by Princeton with a total of 22 points. Brown finished second with 13 points, and Pennsylvania third with 12 points. Other scores were: Yale 6, Chicago 5, New York University 4, Haverford 1.

Dual college meets resulted as follows: Princeton 41, New York University 13; Princeton 27, Pennsylvania 27; Navy 37½, Rutgers 16½; Navy 39, Haverford 15; Navy 32, Yale 22; Harvard 39, Dartmouth 24; Yale 33, Brown 21; New York University 33, Brown 24.

The winners in the Amateur Athletic Union championships were: Parallel bars, P. Hol, Norwegian T. and A. C.; rope climb, F. Seibert, Grace Club; side horse, Joseph Oessey, West Side Y. M. C. A.; tumbling, Arthur Nugent, National T. V.; horizontal bar, B. Jorgensen, Norwegian T. and A. C.; flying rings, Otto A.

Poll, National T. V.; club swinging, Lester McCloud, New York A. C.; all-around, Peter Hol, Norwegian T. and A. C. The team championship was won by the Norwegian T. and A. C. The National T. V. was second, and the New York T. V. third.

**HAAM, AHAD.** See JEWS AND JUDAISM, *Literary Events.*

**HÆMOBRRHAGIC SEPTICEMIA.** See VETERINARY MEDICINE.

**HAIG, SIR DOUGLAS.** See WAR OF THE NATIONS.

**HAITI.** A West Indian negro republic, occupying the western and smaller part of the island of Haiti. The eastern part constitutes the Dominican Republic. The capital is Port-au-Prince.

**AREA, POPULATION, ETC.** The area of the republic of Haiti is estimated at 28,676 square kilometers (11,072 square miles). The population, though not known with accuracy, is denser than in most of the other American republics. The number of inhabitants, according to an estimate of 1909 based on parish registers, was about 2,030,000; in 1912, the number was estimated at 2,500,000, but it is not unlikely that this figure is too large. About 90 per cent of the people are negroes; most of the remainder are mulattoes, who form the aristocracy of the country. Port-au-Prince is the largest city and chief port, having an excellent harbor; its inhabitants are supposed to number over 100,000. The population of Cap-Haitian is estimated at about 30,000; Les Cayes, 25,000; Gonaïves, 18,000.

Elementary instruction is free and has been nominally compulsory since 1910, but the educational system is very imperfect, and illiteracy is prevalent. There are about 400 national schools, besides private schools, and five lycées. The language of the educated classes is French, while that of the peasantry, many of whom show a retrograde tendency, is a patois. The people commonly profess Roman Catholicism.

**PRODUCTION, COMMERCE, ETC.** Possessed of a very fertile soil, Haiti is a country of large agricultural possibility, but agriculture is in a backward state, due to inadequate means of transport, to the unprogressive character of the people, and to chronic political unrest, which discourages the introduction of foreign capital and enterprise. The most important crop commercially is coffee, but its cultivation has been especially retarded by a large export duty. Other crops are cacao, sugar cane, tobacco, and cotton. There are several sugar mills. Rum and other spirits are distilled for local consumption. Valuable woods, especially logwood, are cut for export. Mining is almost entirely undeveloped, although the mineral resources of the country are considerable.

The value of imports (exclusive of those at the port of Jérémie) in 1915 was reported at \$4,344,763, as compared with \$7,612,792 in 1914. Export figures for these years are not available; the estimated value of exports in 1914 was upwards of \$11,300,000 and in 1915 \$13,000,000. For 11 months of 1915 imports and exports were stated to be \$3,653,868 and \$10,050,320 respectively. Imports are chiefly from the United States; exports are largely to France, while considerable amounts are sent to the United States and the United Kingdom. Before the great war exports to Germany were exceeded

only by those to France. For 1913, reported coffee export, 56,962,000 pounds; cotton, 4,266,000; cotton seed, 7,922,000; cacao, 3,989,000; honey, 1,231,000.

The length of railway, including light railway, is about 225 kilometers (140 miles); telegraph line, 124 miles; post offices, 88. The roads are very poor.

**FINANCE.** Duties on imports and exports, which form the greater part of the revenue, are payable in American gold. For the year 1914-15, the customs revenue is reported at \$4,980,746 and other revenue at 4,959,386 gourdes, as compared with \$4,788,368 and 4,978,003 gourdes in 1913-14. The paper gourde has a par value of 96.47 cents, but has depreciated to between 16 and 20 cents. The sanctioned budget for 1915-16 showed an expenditure of \$3,999,732 and 3,479,821 gourdes. Late in 1916 it was announced that, pursuant to an executive decree, the 1915-16 budget would be continued in force for the fiscal year 1916-17. Public debt July 1, 1914, \$25,892,181 and 13,534,812 gourdes. In September, 1915, a treaty between Haiti and the United States was signed, which placed Haitian finances virtually under American control and provided for an American receivership of Haitian customs.

**GOVERNMENT.** The executive authority is vested in a president, who, according to the constitution, is elected for seven years by the two Chambers of the National Assembly in joint session. The lower house of the Assembly is the Chamber of the Communes, members of which (99) are elected for three years by direct vote. Members (39) of the Senate, the upper house, are elected for six years by the Chamber of the Communes, from a list prepared partly by the President of the republic and partly by the electors. The treaty mentioned above provided for the establishment of a native constabulary under command of American officers. The President of the republic in 1916 was Philippe Sudre Dartiguenave, elected Aug. 12, 1915.

**HISTORY.** The treaty with the United States was ratified by the United States Senate on February 28th (see UNITED STATES, *Treaties*). For a long time there had been a serious conflict between President Dartiguenave and his cabinet on the one hand and the Parliament on the other as regards the framing of a new constitution in accordance with the treaty between Haiti and the United States. On May 29th it was reported that the government would resign if Parliament refused to accept the dissolution of the Senate, and if it continued to act as a legislative body instead of a constitutional one. The American commander of the forces in Haiti, Rear Admiral Caperton, supported the President, holding his dissolution decree to be valid. The legislators on the other hand refused to accept it. On May 5th the Haitian cabinet resigned, and a new ministry was appointed on May 10th.

**HALE, FREDERICK.** Elected Republican United States Senator from Maine, Sept. 11, 1916.

**HAMILTON, FRANKLIN.** See METHODIST EPISCOPAL CHURCH.

**HAMILTON COLLEGE.** A non-sectarian institution for the education of men at Clinton, N. Y. It was founded in 1812. In the fall of 1916 there were 220 students and 21 faculty

members. During the year two new professors were added, Dr. Flippen, history, and Mr. Faucher, English. The productive funds of the college amounted to \$1,200,000 and during the year it drew an income of \$85,000. The library contains 70,000 volumes. President, M. W. Stryker.

**HAMPTON NORMAL AND AGRICULTURAL INSTITUTE.** A non-sectarian co-educational institution for negroes and Indians (principally the former), at Hampton, Va. It was founded in 1868. The number of instructors in the fall of 1916 was 133 and the number of students 1839. This includes all departments, among which are a primary day school and a summer school. The productive funds of the institute amount to \$2,886,322 and the total income for 1916 was about \$427,000. The library has 43,100 volumes. In 1916 Maj. Robert R. Moton, commandant of cadets, left the institute to take Booker T. Washington's place at the head of Tuskegee. He was succeeded by Maj. Allen Wadsworth Washington. Major Washington entered Hampton as a student in 1885 and for some years he has been identified with the school, traveling on speaking tours in its behalf. He received training under army officers at Fort Monroe. He has been prominent in various organization for negro improvement. Hampton Institute has friends throughout the country organized into groups which are united in the National Hampton Association. During the year meetings have been held in New York, Boston, Philadelphia, and other cities. In New York a memorial meeting to Dr. Washington (a Hampton graduate) was held. Funds are being raised for an auditorium, to be a memorial to Robert Curtis Ogden, for many years president of the Board of Trustees of Hampton. The present president is William H. Taft. The principal of the institute is Hollis Burke Frissell.

**HANNAY, CANON JAMES OWEN.** See LITERATURE, ENGLISH AND AMERICAN, *Fiction*, English.

**HARAHAN BRIDGE.** See BRIDGES.

**HARBORS.** See DOCKS AND HARBORS.

**HARDEN, MAXIMILIAN.** See GERMANY, *History*.

**HARDIE, WILLIAM ROSS.** A British classical scholar, died in Edinburgh May 3, 1916. He was born in 1862 in Edinburgh, and was educated there at the university and at Balliol College, Oxford, where he had a brilliant career as a student, winning some of the highest prizes and scholarships and being elected fellow of Balliol in 1884. There he remained as tutor till 1895, when he was called to Edinburgh to accept the chair of humanity. His scholarly work, evincing great literary gifts as well as profound knowledge, appeared in published form as: *Lectures on Classical Subjects* (1903); *Latin Prose Composition* (1908); *Silvula Academicæ, Verses and Verse Translations* (1912). St. Andrews conferred on him the honorary degree of LL.D.

**HARDING, WILLIAM L.** Elected Republican Governor of Iowa, Nov. 7, 1916.

**HARPIGNIES, HENRI JOSEPH.** A French landscape painter, died at Saint-Privé Aug. 29, 1916. He was born in Valenciennes in 1819, studied under Achard in Paris, and later in Rome, and first exhibited at the Salon in 1853. He did not receive general recognition for his work till comparatively late in life. Then he

was made commander of the Legion of Honor, was elected secretary of the Society of French Artists, and was awarded prizes at several exhibitions outside France, as well as the medal of honor at the Paris Salon in 1897. Some of his work was done in water colors. In the Luxembourg, Paris, are "Evening in the Campagna," "Le Saut de Loup," and "Moonrise," and in the Metropolitan Museum, New York, is another "Moonrise." Harpignies was particularly fine as a painter of trees.

**HARRIS, FRANK.** See LITERATURE, ENGLISH AND AMERICAN, *Fiction*, English.

**HARRIS, NORMAN WAIT.** An American banker and philanthropist, died at his summer home at Lake Geneva, Wis., July 15, 1916. For most of his life he had been connected with the business and public life of Chicago. Born in Becket, Mass., in 1846, he graduated at 17 from Westfield Academy, Mass., and entered the insurance business. From 1867 to 1880 he served as secretary of the Union Central Life Insurance Company of Cincinnati, which he helped to organize. In 1882 he established the banking house of N. W. Harris and Company of Chicago, New York, and Boston, with headquarters in the first named city, from 1907 to 1913 he was president also of the Harris Trust and Safe Deposit Company of Chicago, and he held the same office in Harris, Forbes, and Company of New York. Mr. Harris became prominent as a liberal benefactor of religious, educational, and other institutions. He was prominent in his denomination, the Methodist Episcopal Church, and for long had been a member of the International Committee of the Y. M. C. A. His largest gifts were made to the Chicago Training School for Home and Foreign Missions, to Northwestern University, to the Field Museum, and to the Y. M. C. A. He claimed direct descent from Charlemagne, and descent from the Countess Adelia, the Fair Maid of Brabant, whom Henry I, King of England, married.

**HART, JAMES MORGAN.** An American philologist, died April 18, 1916, at Washington, D. C. He was born in 1839 at Princeton, N. J., graduated from Princeton College in 1860, and three years later took his A.M. there. The next year he received the degree of J.U.D. at Göttingen. For four years Dr. Hart was an assistant professor at Cornell, from 1876 to 1890 he held the chair of modern languages and English literature at the University of Cincinnati, and then returned to Cornell, where he remained till his retirement in 1907. He edited several German and English classics, and published, among other books: *German Universities* (1874); *Handbook of English Composition* (1895); *Standard English Speech in Outline* (1907).

**HARVARD UNIVERSITY.** A non-sectarian educational institution at Cambridge, Mass. It was founded in 1636. The enrollment of students in the fall of 1916 was 6306. The faculty numbered 892. The productive funds of the institution amounted to \$28,448,701 and the total income to \$3,019,602. There are 1,183,000 volumes in the library. In 1916 new courses were offered in the Harvard Summer School by Prof. George P. Baker (whose drama classes have become famous), and by Professors Copeland, Coolidge, Wilson, and Greenough. Ernesto Quesada was appointed professor of Latin-American history and economics for 1916-17, and Drs. Edward H. Nichols

and Charles A. Porter became clinical professors in the Medical School. The Medical School is to provide a new course in military medicine, to be conducted by Maj. Weston P. Chamberlain, U. S. A. Prof. Wallace C. Sabine was honored by being chosen exchange professor to France for 1916-17. On June 22nd gifts for the preceding academic year amounting to \$1,344,283 were announced. The 25-year class (this time that of 1891), presented to the university the customary \$100,000. The president of Harvard is A. Lawrence Lowell. See also RADCLIFFE COLLEGE.

**HVERFORD COLLEGE.** An institution for the education of men, at Haverford, Pa. It was founded in 1833 and is under the control of the Society of Friends (Quakers). In the fall of 1916 there were 25 instructors and 195 students. In productive funds the college has \$2,517,482, yielding an income of about \$98,000. The library contains 70,000 volumes. After more than 40 years in the service of Haverford, since 1887 as president, Dr. Isaac Sharpless resigned in 1916. His name will be given to a new Science Hall, to be erected in 1917. Prof. A. G. H. Spiers resigned to accept a chair at Columbia University, and his courses in Romance languages were taken by Dr. Joseph Seronde and Charles H. Livingston. The late T. Wistar Brown, president of the Haverford corporation and generous benefactor of the college, left to it \$409,321. The children of Gideon Scull gave \$146,000 to establish a chair in English constitutional history, and Henry Cope gave \$9040. Asa S. Wing of Philadelphia was elected president of the corporation.

**HAWAII.** POPULATION. The estimated population of the islands on June 30, 1916, was 273,623, a net increase of 75,714 since 1910. The population was divided as follows: Hawaiian 23,770, part Hawaiian 15,334, Portuguese 23,755, Spanish 3577, Porto Rican 5187, other Caucasian 16,042, Chinese 21,954, Japanese 97,000, Filipinos and others 22,152, army and navy 8852.

**COMMERCE.** The imports for the fiscal year 1916 aggregated \$34,098,210, compared with \$26,064,855 for 1915. The import of foodstuffs for home consumption were \$7,813,359, compared with \$8,739,609 for 1915, the difference being accounted for by the falling off in breadstuffs imported. The exports aggregated \$64,670,852, compared with \$62,368,356 in 1915. The sugar exports during the year amounted to 568,584 tons, valued at \$54,409,585, and pineapples at \$6,889,705, or a total of these two products of \$63,299,290, compared with a value in 1915 of \$59,272,129. Other principal products were as follows: Coffee, \$418,807; hides, \$259,623; rice, \$144,120; bananas, \$209,026. Customs receipts for 1916 amounted to \$1,161,057, compared with \$1,119,534 in 1915. Internal receipts yielded \$894,137, an increase over the year 1915 of \$159,555.

**EDUCATION.** During the year there were maintained on the islands 171 public schools with 804 teachers, and 80,235 pupils. The cost of maintenance of the schools was \$899,501. There were also 526 private schools with 324 teachers, and a total attendance of 7741. The number of pupils of all races in public and private schools was 36,529 in 1915, as compared with 37,946 in 1916, an increase of 1417. In addition to the schools already mentioned in

the Territory there are 112 Japanese schools, given over to the teaching of the Japanese language, and other subjects peculiarly Japanese. In these there were over 10,000 pupils.

**PUBLIC HEALTH.** The greater part of the health work of the islands is cared for by the territorial Board of Health, though some of it is handled by the local governments. There was a slight increase of 1.2 per cent in the mortality rate in 1916, which was largely due to an increase in the rate of cases of measles. There was a medical inspector appointed during the year. The Territory employs 26 physicians who visited during the year 11,283 homes, examined 19,628 school children, and vaccinated 3387. A complete sanitary survey was made of every dairy in the Territory. The work of compiling a sanitary code is under way, a commission having been appointed during the year.

**GOVERNMENT.** The government in 1916 created the Hawaiian National Park, which is the first national park lying outside the continental boundaries of the United States. In the park are included the three Hawaiian volcanoes, Kilauea, Mauna Loa, and Haleakala, in trust for protection and development with the Department of the Interior.

**Officers 1916.** Governor, Lucius E. Pinkham; Secretary of the Territory, Wade W. Thayer; Attorney-General, I. M. Stainback; Auditor, J. H. Fisher; Treasurer, Charles J. McCarthy; Superintendent of Public Works, Charles R. Forbes; Commissioner of Public Lands, B. G. Rivenburgh; President of the Board of Health, J. S. B. Pratt; Superintendent of Public Instruction, Henry W. Kinney.

**Judiciary.** Supreme Court: Alexander G. M. Robertson, Chief Justice; Associates, Ralph P. Quarles and Edward M. Watson; Clerk, James A. Thompson; Circuit Judges, Clarence W. Ashford, W. L. Whitney, Thomas B. Stuart, W. S. Edings, James Wesley Thompson, Lyle A. Dickey, Clement K. Quinn.

**Federal Officers:** District Judges, Horace W. Vaughan, Charles F. Clemons; Clerk, A. E. Murphy; Marshal, J. J. Smiddy; Collector of Customs, Malcolm Franklin; Collector of Internal Revenue, John F. Haley; District-Attorney, S. C. Huber.

**HAY.** As estimated by the Department of Agriculture the hay production of the United States in 1916 amounted to 109,786,000 tons, of which 89,991,000 tons was tame hay and 19,795,000 tons was wild hay. The tame hay was produced on an area of 54,965,000 acres at the rate of 1.64 tons per acre, and the wild hay on 16,637,000 acres, the average yield being 1.19 tons per acre. The farm value on Dec. 1, 1916, of the tame hay was placed at \$11.21 and of the wild hay at \$7.75 per ton, the total values at these prices being \$1,008,894,000 and \$153,411,000 respectively. The value of tame hay per ton has often been exceeded but the total value of the 1916 crop is the highest on record. As compared with 1915 the acreage of tame hay in 1916 was greater by 3,857,000 acres, the production by 4,071,000 tons, and the value by \$95,250,000. The supply of old tame or cultivated hay on farms on May 1, 1916, amounted to 11,030,000 tons or 12.9 per cent of the preceding year's crop, the largest May 1st holdings for the past seven years although the consumption during the year had been heavy.

Increased acreage was devoted to alfalfa and

Sudan grass. Nearly one-fourth of the tame hay of the country is alfalfa hay. Sudan grass is growing in popularity in sections of low rainfall. The State of Kansas is reported as already devoting over 20,000 acres to this grass. Imports of crimson clover seed into the United States for the year ending June 30, 1916, were less than half of those of the two preceding years and the imports of hairy vetch seed were also much reduced as compared with the imports of 1914 and 1915. On the other hand, the importation of red clover seed from July 1, 1915, to March 31, 1916, amounted to 25,815,357 pounds, an amount exceeding any previous importation in an entire year. There was a shortage of white clover seed in England owing chiefly to the cutting off of imports from enemy countries.

**HAY, LORD JOHN.** A British admiral, died May 4, 1916, at Fulmer, Buckinghamshire, England. The fourth son of the eighth Marquis of Tweeddale, Lord John was born at Geneva, Switzerland, in 1827, and entered the navy at 13. His early service was in the China war and before Sebastopol. By 1861 he had risen to be commodore of the East India station. Before this, however, he had entered politics, as member of Parliament for Wick (1857-59). From 1866 to 1871, also, he sat in the House, for Ripon, and he was several times a Lord of the Admiralty. While in command of the Channel Squadron in 1877-79 he took possession of and administered Cyprus (1878); in 1883-86 he commanded the Mediterranean station; for two years was commander-in-chief at Devonport; and from 1888 till his retirement in 1897 was admiral of the fleet. In 1886 he received the G.C.B.

**HAYES, CHARLES WILLARD.** An American geologist, died in Washington, D. C., Feb. 8, 1916. He was born at Granville, Ohio, in 1859, graduated from Oberlin College in 1883, and took advanced work at Johns Hopkins, receiving the degree of Ph.D. in 1887. Appointed in that year assistant geologist on the United States Geological Survey, he had risen by 1902 to be chief geologist, a post that he held until 1911. He resigned to become vice-president and general manager of the Mexican Aguila Oil Company, and at the time of his death was chief geologist of all of Lord Cowdray's oil explorations. In 1898-99 Dr. Hayes served as geologist to the Nicaraguan Canal Commission. He wrote numerous articles on theoretic and economic geology, and a *Handbook for Field Geologists* (1912).

**HEALTH.** See HYGIENE.

**HEAT.** See PHYSICS.

**HEDEMAN, JULES.** A French journalist, killed in the Verdun battle June 13, 1916. He was born in Rennes in 1869, of a Dutch father and a French mother. Removing to Paris, he became a naturalized Frenchman. He was a relative of the great journalist Henri de Blowitz, long Paris correspondent of the *London Times*. M. Hedeman's writings on international subjects began to attract attention in 1901, when he became London correspondent of *Le Matin*, and thereafter he was regarded as one of the most able writers in his field. At the opening of the great European war in 1914, he had been for nine years foreign editor of *Le Matin*. Immediately volunteering for service, he went into the trenches as a common soldier, but was soon made lieutenant for bravery. He continued to write occasionally on topics connected with the

war. In the United States, M. Hedeman was perhaps better known than any other French journalist of his time, and on various occasions he had been received at the White House, by Presidents Roosevelt, Taft, and Wilson. In 1914, when Huerta had been recognized as President of Mexico by several European governments, although the Wilson administration refused to follow their lead, Hedeman came to the United States, studied the situation, and wrote for *Le Matin* a vindication of the President's course, urging France to cling to its friendship with this country rather than to support Mexico. He was an officer of the Legion of Honor.

**HEIDENSTAM, VERNER VON.** See VERNER VON HEIDENSTAM.

**HEINE, HEINRICH.** See GERMAN LITERATURE. *New Editors.*

**HELL GATE BRIDGE.** See BRIDGES.

**HENDERSON, ARTHUR.** A British statesman, appointed minister without portfolio in Lloyd George's cabinet, formed December, 1916, and a member of the War Council. He has been a member of Parliament continuously since 1903, and was president of the Board of Education in the Asquith coalition cabinet in 1915, but resigned. He is secretary of the Labor party. See GREAT BRITAIN, *History.*

**HENRY, O.** See LITERATURE, ENGLISH AND AMERICAN, *Essays, etc.*, American.

**HEPBURN, WILLIAM PETERS.** An American legislator and expert on railway management, died at Clarinda, Iowa, Feb. 7, 1916. Born at Wellsville, Ohio, in 1833, he was early taken to Iowa, where he entered a printing office. Later he studied law, being admitted to the Illinois bar at 21. In legal practice, he had gained a reputation in Iowa before the Civil War, as prosecuting attorney of Marshall County and as district attorney of the Eleventh Judicial District. He served throughout the war, rising to be a lieutenant-colonel of cavalry. For two years he lived at Memphis, Tenn., but after 1867 at Clarinda, Iowa. A Republican in politics, Colonel Hepburn was first elected to Congress in 1880, after a contest which resulted in his receiving the nomination on the 385th ballot. He served as a Representative continuously until 1887, from 1888 to 1893 was solicitor of the Treasury, and from the latter year to 1909 was again in Congress. In the 58th to 60th Congresses Colonel Hepburn was chairman of the Republican caucus, and in the 59th and 60th he served as chairman of the Committee on Interstate and Foreign Commerce. While he held this post, he framed three important laws, the Hepburn Rate Law, the Public Health Act, and the Pure Food Act. The first of these, for which he is particularly known, increased the powers of the Interstate Commerce Commission, and required railroads to report annually to the government on their condition. Although just before his retirement, Colonel Hepburn advocated decreasing the powers of the Speaker of the House, as exercised by Speaker Cannon, he was essentially conservative and out of sympathy with the advanced ideas of the new Iowa leader, Albert B. Cummins.

**HEBERMANN, CHARLES GEORGE.** An American editor, died Aug. 24, 1916, in New York City. He was born near Münster, Westphalia, Germany, in 1840, came to the United States in 1851, and in 1858 graduated from the College of St. Francis Xavier, New York

City. He afterward taught at the City College, where he became professor of the Latin language and literature in 1869, and also librarian in 1873. He was appointed editor-in-chief of the *Catholic Encyclopedia* in 1904. He was president of the Catholic Club (1874-75) and of the United States Catholic Historical Society (1898-1913). He published editions of Sallust's *Bellum Jugurthinum* and *Bellum Catilinarium*, edited *Unpublished Letters of Charles Carroll of Carrollton* (1902), Thebaud's *Forty Years in the United States* (1904), Waldseemüller's *Cosmographia Introductio* (1907), *Historical Records and Studies*, 1 volume annually, and *Diary of a Visit to the United States by Lord Russell of Killowen* (1910); translated Torfason's *History of Vinland*; and wrote *Business Life in Ancient Rome* (1880). He also contributed articles to reviews.

**HERZEGOVINA, THE.** Part of the Austro-Hungarian territory of Bosnia and the Herzegovina. See **AUSTRIA-HUNGARY**.

**HESSE, RICHARD.** A German forester, died at Giessen, Jan. 18, 1916. He was born in Gotha in 1835, was educated at Aschaffenburg and at Göttingen, and when 23 years old entered the forestry service of Gotha. After 1868 he was for many years director of the Academic Institute of Forestry at the University of Giessen, where he was a professor. His most important publication is *Der Forstschutz* (1876-78; 3rd ed., 2 vols., 1896-99). His other publications include: *Grundriss zu Vorlesungen über Forstbenutzung und Forsttechnologie* (2nd ed., 1901); *Der akademische Forstgarten bei Giessen als Demonstrations- und Versuchsfeld* (2nd ed., 1890); *Die Eigenschaften und das forstliche Verhalten der wichtigeren in Deutschland vorkommenden Holzarten* (2nd ed., Berlin, 1895); *Encyclopädie und Methodologie der Forstwissenschaft* (Nordlingen, 1885-92)
